Collections of 12 ORCHIDS were contributed by Messrs. Carson, Clarke, and Summerfield. Mr. Carson had Anguloa Ruckeri with one bloom, the handsome Oncidium Lanceanum, a good specimen of Dendrobium nobile; Scuticaria Steeli, with two large pale yellow, brown spotted flowers; and Aerides Larpentæ; the latter scarcely out enough. Among Mr. Clarke's plants the best were Phalænopsis grandiflora, Odontoglossum læve, a pretty little Oncidium ampliatum majus, Cattleya intermedia, and a small plant of Vanda insignis. Mr. Summerfield sent Odontoglossum hastatum, Phalænopsis amabilis, Cattleya Mossiæ, and Oncidium leucochilum in good condition.

ORCHIDS in sixes were shown by Mr. Green and Mr. Jarvis. The former sent good examples of Aerides crispum and Epidendrum macrochilum, and the latter had the handsome Dendrobium chrysanthum and Brassia verrucosa. Mr. Lawrence, gr. to the Bishop of Winchester, at Farnham Castle, produced a plant of Gongora cymbiformis, with a noble spike of pale yellow, brown-spotted flowers. This was elevated on a stake so as to allow its long pendant spike to hang down, and shown in this way it was very much admired. Mr. Woolley had a white Bletia, which promises to be worth attention.

ROSES IN POTS were again produced in first-rate order. The best plants came from Messrs. Lane, and nothing in their way could certainly be finer than they were; Mr. Francis was second, and Messrs. Paul third. Among the different varieties we remarked Géant des Batailles, Paul Perras, Coupe d'Hébe, Nephetos, Baronne Prevost, Souvenir d'Un Ami, Juno, Chenédolé, and other well known favourites.—In the Amateurs' Class, A. Rowland, Esq., was first, Mr. Busby second, and Mr. Sage third. In these collections, the plants were smaller than those of the nurserymen; but they were all of them skilfully cultivated, and extremely well bloomed.

About CAPE HEATHS there is little to report beyond what was said of the plants at Chiswick. Collections of them came from Messrs. Rollisson, Fraser, May (gr. to Mr. Colyer), Williams (gr. to Miss Traill), Peed, Carmichael (of Bath), Barter, Roser, Over, Taylor, and Jarvis. They were all very finely in bloom; and though not so showy as some other kinds of plants, they, nevertheless, had many admirers.

Novelty there was scarcely any. Messrs. Veitch sent Impatiens Jerdoniæ; Messrs. E. G. Henderson, Eucharis candida; Messrs. Henderson, Pine-apple Place, a dwarf shrubby orange Gompholobium; and Messrs. Fraser, Brilliantaisa owariensis, a plant with blue Sage-like flowers.

One or two collections of Ferns, and some variegated and other plants remarkable for fine foliage, were staged; but among them we did not observe anything that has not been previously reported on.

PELARGONIUMS occupied two sides of the lower series of terraces, and being generally well grown they made a good display. Among Nurserymen, Mr. Turner was first, with large and fine plants of Sanspareil, Colonel of the Buffs, Challenger, Exactum, Mochanna, Magnificent, Lablache, Rosamond (a very fine plant), Queen of May, Enchantress, Virgin Queen, and Magnet; 2d, Mr. Dobson, with Governor, Leah, Purpureum, Vanguard, Guhelma, Arethusa, Pasha, Delicatum, Glow-worm, Empress, Rosamond, and Ambassador. Mr. Gaines also exhibited 12 varieties, for which a Silver Medal was awarded. Fancies, six varieties: 1st, Mr. Turner, with beautifully grown and flowered plants of Madame Sontag, Madame Rosati, Defiance, Delicatum, Anais, and Princess Maria Galitzin; 2d, Mr. Gaines, with Defiance, Fairy Queen, Delicatum, Signora Casolini, and Oderatum magnificum; 3d, Messrs. Henderson, Pine-apple Place. Amateurs: 1st, Mr. Winsor, with excellent plants of John Bull, Duchesse d'Aumale, Fairy Queen, Statuiski, Madame Meillez, and Princess Maria Galitzin: 2d, Mr. Smith, Hampstead, with Advancer, Jenny Lind, Empress, Alboni, Triumphant, and Hero of Surrey; 3d, Mr. Robinson, with Mirandum, Jenny Lind, Fairy Queen, Delicatum, Advancer, and Princess Maria Galitzin. This class consisted of no fewer than nine collections, all of which were very creditable to their respective growers.—Amateurs: 1st, Mr. Nye, gr. to E. Foster, Esq., with compact and uniform plants of Purple Perfection, Alibi, Lucy, Enchantress, National, Ariel, Eleanor, Queen of May, and Rosa. These, as will be seen, were mostly new sorts; 2d, Mr. Winsor, gr. to F. Steel, Esq., with Constance, Clio, Norah, Emily, Forget-me-Not, Laila Rookh, Virgin Queen, Ariadne, Prince of Orange, and Enchantress; 3d, Mr. Robinson. Two other collections were also exhibited in this class.

Among SEEDLING PELARGONIUMS were Grand Sultan (Turner), a sort with dark top and rich red lower petals, each of the latter having a dark spot, a striking kind, with a good habit. Pandora (Foster), similar, but less attractive, and without spot on the lower petals. Una, a good useful white, in the way of Pearl. Petruchio (Foquette), a large showy crimson; but coarse and thin. Conqueror (Beck), like the Grand Sultan and Pandora in colour, and good in quality and attractive. Wonderful (Hoyle), a large flower of fine colour and form, throat white. Serena, dark, with pale centre, very promising. Lord Raglan, in the way of Salamander, and therefore very showy; and Topsy, top petals very dark.

Of CALCEOLARIAS there were four collections. The 1st prize was awarded to Mr. Carmichael, of Bath; but on what grounds we could not discover; for the group from Mr. Constantine, to whom the 2d prize was given, contained plants nearly twice as large and far better grown than those from Bath. They were half shrubby kinds, with which no fault could possibly be found, except that they were, perhaps, a little too much alike. Mr. Clarke and Mr. Gaines also showed Calceolarias. Mr. Price, gr. to L. Lloyd, Esq., Hampstead, had a seedling which was bright reddish brown in colour, and which looked as if it would make an extremely good bedding plant.

CINERARIAS were not in such good condition as we have seen them. Messrs. Henderson, of Pine-apple Place, had Mrs. Sidney Herbert, Lady Canoys, Marianne, Lady Hume Campbell, Beauty, and Mrs. Beecher Stowe: 2d, Mr. Clarke. Amateurs: 1st, Mr. Ward, with Newington Beauty, Cerito, Vicar of Wakefield, Rosetta, David Copperfield, and Estelle.

PANSIES, in pots, were numerous and fine. 1st, Mr. Turner, with Earl of Mansfield, Marion, Pandora, Sir John Cathcart, National, Emperor, Monarch, Memnon (a fine dark self); 2d, Mr. Bragg; 3d, Mr. Dobson. There were also several stands of cut flowers, the best of which came from Mr. Turner, of Slough. Of Seedlings there were one or two promising flowers, the most conspicuous being Lord Palmerston. Lord John Russell, a yellow ground sort, is also a good flower; as is also Royal Albert, a richly-shaded plum-coloured kind. Satisfaction and Duchess of Sutherland are also good flowers.

The GREAT NATIONAL TULIP EXHIBITION was held in the Royal Botanic Society's Museum on this occasion. There was a large and fine display of this favourite flower, and altogether we understand that the meeting was eminently successful. The exhibition of this Society for 1855 is, we learn, to take place at Cambridge.

Notices of Books.

The Prize Essay on Portugal, &c. By J. J. Forrester, Wine-grower in the Alto Douro. 2d edition. 8vo, pp. 290. Weale.

THIS volume, written to meet an offer made some time since by Mr. Oliveira, M.P., of a premium of fifty guineas for the best essay on Portugal, in connection with the objects of the Great Exhibition in 1851, is one of the most important of its class which has appeared for many years. The Great Exhibition showed distinctly the natural wealth of Portugal—how abundant are its resources, and what varied means the people possess for raising their country from its present state to that of wealth and independence. But the Exhibition did not explain the reasons why such great natural advantages are inoperative. Everybody believed, indeed, that monopoly was the incubus which weighed down the nation and stifled its energies; but it was by no means understood in what way monopoly acted, or by what other evils it was accompanied. Mr. Forrester's work explains the matter fully; he is intimately acquainted with the country and the people; possesses, we believe, considerable property in Portugal, and has access to whatever there is of authentic among the national records. As a wine-grower of the first rank, the facts connected with the greatest of Portuguese products are familiar to him. He has, moreover, the courage to speak out respecting abuses which demand correction, as we know from his celebrated exposure of the port wine trade,* and of the causes which are rapidly leading to its expulsion from the tables of English gentlemen.

It is no part of our duty to open the question of free trade in wine, or to deal with the general statistics of Portugal. Of the first it is enough to say that the only wines which a low duty could make acceptable in this country are those of Portugal and Spain; and that it would be of little use to introduce even these into competition with ale, porter, and spirits, unless they were of better quality than the "black strap" and brandied drenches which form the low-priced rubbish current here under the name of port and sherry. In this respect Mr. Forrester entertains the same opinion as ourselves. As to the second point, when it is known that there are no public conveyances of any kind in the interior of Portugal, that the whole post-office expenditure is under 17,000*l.* a year, that the rate of mail travelling is three miles an hour, that Portuguese coasting vessels require twice as many hands in proportion to the tonnage as British, and finally that agriculture is at a very low ebb, the most primitive customs prevailing, all modern improvements being carefully eschewed, and the hoe, with "a very rude wooden plough, is about the only agricultural implement in use," it is needless to seek for the further causes of Portuguese depression.

To the readers of our columns the most interesting part of the work will be that which treats of the cultivation of the Vine, and the mode of making the wines, upon which Mr. Forrester treats succinctly, but with abundance of practical knowledge. The minutes of his evidence given before a select committee of the House of Commons in 1852 are also of great importance. He fully confirms the accuracy of the information we had ourselves published respecting the prevalence of the Vine disease in the Vineyards of the Alto-Douro. In October last he looked for a speedy cessation of the malady, but we believe that his opinion upon that point is very greatly changed for the worse by the evidence of the present spring. That the evil will be transitory, like the Potato rot, we are justified in hoping: but experience leads us also to the conviction that the Portuguese, as well as other wine makers, have very evil days before them.

Want of space forbids us to extend our notice of Mr. Forrester's able work, further than to find room for the following extract relating to the situations in which the Vineyards of the Alto-Douro were most or least affected in 1853 by the disease in question:—

"From the autumn of 1852 until near midsummer of this year (1853), continued rain, sleet, hail, and bleak winds prevailed in the north of Portugal. Spring there was none. The Vines became super-abundant in sap and vigour, but lacked sufficient heat for the development of their properties, and gentle breezes for the evaporation of the excessive moisture from the soil around them. In the exposed situations (on the heights or in the Ramo district), even if the waters were evaporated, the cold bleak winds nipped the fruit in the bud, so that the Grapes which at first gave indications of great abundance, grew no larger than Peas, were covered with mildew, and eventually decayed. In the low grounds the water remained stagnant; the land could not drain itself, and the current of air ran too high to produce beneficial effects upon it. The Vineyards were full of wood, and bore abundantly. The Grapes grew to their full size and ripened; but, with very few exceptions, the bunches and stalks were covered, more or less, with mildew, and every Grape contained from three to four seeds. On the slopes of the mountains, the rocky banks of rivers, or of rivulets, on either margin of the Douro, the waters naturally ran off, and the breezes ventilated the Vineyards. On these slopes (of which the real Port-wine district is chiefly composed, and which in all years are the finest situations), the Vines were not only vigorous and healthy, but altogether free from the blight, so general on the heights and low grounds, and the Grapes were beautifully formed, ripe, and delicious, producing fine and wholesome wine."

How like the Potato disease!

We should add that the volume is accompanied by a very valuable map of the wine district of the Alto Douro.

Elements of Geometry and Mensuration. Part I. *Geometry as a Science*, by Thomas Lund, B.D. 12mo., pp. 87, is well adapted to the wants of those for whom it is written, *e.g.* persons desirous of learning both the elementary principles of theoretical geometry and their practical application to the purposes of common life. For self-teaching it appears excellent.

FLORICULTURE.

CULTURE OF THE CALCEOLARIA.—Admirers of this flower could not fail to have been highly pleased with the beautiful exhibitions of it, which were produced at the Royal Botanic Society's show in Regent's Park, on Wednesday last; and as I have myself been a very successful grower and exhibitor of this useful plant, I

* A Word or Two on Port Wine, &c., showing how and why it is adulterated, &c. Richardson, Cornhill, 1844; a shilling pamphlet which every one should read.

beg to furnish you with my mode of managing it. I make my first sowing about the middle of July, and another about the 1st of August, in pans half filled with drainage, and then filled up with a mixture of about two-thirds light loam, the rest peat and leaf-mould in about equal proportions, with a good sprinkling of silver sand, all sifted tolerably fine; the pans must then be thoroughly watered, so as to wet every particle of soil, and allowed sufficient time to drain before sowing; the seed may then be sown thinly, and a little finely-sifted soil scattered very lightly over it. The pans may be placed beneath a hand-glass under a north wall, or in any other shady situation, and kept tolerably close until the plants make their appearance. The pans must be kept moist, merely sprinkling with a very fine-rosed pot; great care is required here, for if they are at all heavily watered, the seed, being so very fine, is all carried away with the water. When the plants make their appearance, more air may be given them; as soon as they will bear handling, they should be pricked out into other pans (prepared in the same manner), about 2 or 3 inches apart. They will soon make nice little plants, and may then be potted off singly into 3-inch pots, using a mixture of about two-thirds tolerably light turfy loam (not sifted), the rest leaf-mould and dung from an old Mushroom-bed, in about equal proportions, with a good sprinkling of sand; they may then be placed in a cold pit, and allowed plenty of air. The plants will soon progress rapidly; as they fill their pots with roots they must be shifted into larger sizes, until they are in 8-inch and 11-inch pots, which are large enough for any Calceolaria; they must be frequently fumigated, to keep down green-fly; all they require through the winter will be to keep the frost from them; let them have plenty of air, and at the same time keep them rather dry at the root than otherwise. As the spring advances, and as the plants fill their pots with roots, more water may be given, occasionally using weak clear manure-water. As the plants increase in growth, let the shoots be pegged down on the soil; they will root into it, and help the plants considerably. According to the time they are wanted to be in flower, let the shoots be stopped, or otherwise those that are not stopped will be in flower early in May, while those that are stopped will come into flower probably a month later; and now comes the time to repay us for our trouble. No plant can be more gay than Calceolarias while they are in flower; one only regrets that they are so soon gone. A cool, airy greenhouse is the place for them while they are in flower; they must be kept shaded from the sun, and at no time are they fond of too much light. If seed is required, it must be looked after, setting aside a few of the best marked and best formed flowers for that purpose; these must be carefully fertilised, otherwise it is in vain to look for seed; and even then it frequently ends in disappointment. The best flowers are not the best seeders; on the contrary, they are generally the worst; they not unfrequently die off altogether without ripening a single seed. If you wish to propagate certain varieties, they should not be allowed to seed at all, but should be cut down directly they are done flowering, fresh surfaced, and set in a shady situation; they will soon throw up some cuttings, which may be taken off and struck under a hand-glass in a shady situation. When struck, they may be treated the same as recommended for seedlings; but unless you have got something very first-rate, it is hardly worth while to try to save them at all, as they seldom make such fine plants as those raised from seed. If proper care is used in saving the seed from the best varieties, the generality of the plants so raised may be expected to be equal, and probably a few superior to the varieties they are raised from. I think we must thus admit that the soft-wooded varieties must be treated almost as annuals. The above treatment is recommended for soft-wooded varieties; but it will also apply equally to shrubby kinds, in which we must allow there is a great deal to be done; by carefully crossing the soft-wooded with the shrubby varieties some first-rate things may be obtained. The shrubby habit may be obtained with the large fine flowers of the soft-wooded sorts. Such plants may be perpetuated from cuttings; but every one who has grown the soft-wooded kinds must admit that it is a matter of no small difficulty to save a variety from one year to another. Besides, varieties from crosses so obtained are more perpetual flowers; they keep growing and flowering a much longer time, and are splendid things for the greenhouse and conservatory. *E. H.*

CHRYSANTHEMUM: *Anon.* Your plant of Hendersoni proves that there is no difficulty in having Chrysanthemums in flower in May, if that is desired; for it is quite as full of pretty little yellow blossoms now as it could possibly be in September.

Miscellaneous.

Crystal Palace Aquariums. — It may interest our practical readers to learn what material is being used for the lining of the bottom of the great basins, or aquariums, one at each end of the building. Portland cement concrete is employed. Large slabs are cast in iron moulds, from which the slabs can be raised by a travelling crane. They are then laid on a floor of iron girders, and the joints are set and run with cement. *Builder.*

Introduction of the China Rose.—"I was delighted with Haarlem. We remained there several hours to admire the beautiful garden, and to see the gardener, who is celebrated throughout Europe. The gardener showed us different kinds of plants with which we were unacquainted; amongst others, a shrub that produces magnificent flowers, of which the petals are soft as velvet, but odourless. He told us that it was called the Chinese Rose, and had been imported within the last year with great care. Roses of this species may, in fact, be seen delineated on screens and in the corners of fans." *Memoirs of Baroness D'Oberkirch*, vol. ii., p. 118. *Haarlem, July* 17, 1782.

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Now that the cold pits and frames will be cleared of the bedding stock, they will form excellent places during summer for the growth of many things for the autumn and winter decoration of the conservatory. Indeed, many of our most useful plants for this purpose will do better for the next three months in cold frames than in larger houses, where the state of the atmosphere is not so much at command, nor the plants so readily examined, as in these humble structures. Roses are, perhaps, more generally admired than any other class of plants, and bloom freely in the conservatory in autumn and early winter, if properly attended to at the right time. Young plants of the perpetual flowering kinds, as Teas, Bourbons, Hybrid and Damask Perpetuals, if placed in a cold frame and properly attended to with pot room, and liberally supplied with manure water, will soon form nice-sized specimens. But in order to secure their blooming freely in autumn and early winter, the flowers must be picked off as they make their appearance, and strong stocky growth secured by giving abundance of air, exposing the plants to the night dews, and keeping the shoots stopped and tied out as may be required, and otherwise attending to the habit of the variety.

FORCING DEPARTMENT.

PINERY.—There must be no lack of attention at this season in supplying the wants of succession stock. Never allow plants to remain any longer in want of pot room than can be avoided; for allowing them to remain in a pot-bound state at this season will be sure to cause them to fruit prematurely; therefore, if only a few are observed to be in want of repotting, these should be got out at once and attended to. Be very particular to have the balls properly moist at the time of repotting; for if this is neglected, it will be difficult to properly attend to it afterwards. Use good fresh turfy loam and peat, in the proportion of two parts of the former to one of the latter, and add a sprinkling of crushed bones and some clean sharp sand, in which the plants will be found to root more freely than in heavier soils, and richness can be added by using manure water. Let plants growing in open beds have a proper supply of water, and maintain a steady bottom heat of about 85°.

VINERIES.—Keep the atmosphere of houses in which the fruit is ripe as equable and cool as possible so as to prevent the increase of insects, and preserve the foliage in a healthy state as long as possible. Give every attention to the state of the borders of houses where the fruit is colouring, and endeavour to keep them in a medium state as to moisture. Borders of latter houses, from which the covering has been lately removed, must also be carefully examined, for it is frequently found, on removing the covering, that the border is dry a few inches below the surface. If this is found to be the case, give water, sparingly at first, as a liberal supply given at once would probably cause many of the berries to split, particularly if the borders have been rather dry for any length of time. It will be much safer to give two or three gentle waterings at intervals of a few days, and this will also moisten the border more effectually.

PEACHES.—Attend to former directions, keeping the borders and atmosphere moist until ripening commences, when the treatment should be rather dry, admitting air very freely, to assist in flavouring the fruit.

FLOWER GARDEN AND SHRUBBERIES.

That the proper keeping of the garden may be as little interfered with as possible, through the litter and confusion consequent on "turning out," use every dispatch to bring this work to a finish. But if any portion of the stock is not sufficiently prepared, allow it to remain under glass as much longer as may be necessary, and plant out nothing but strong plants that have been carefully inured to the sun and air; for weakly ill-prepared stuff is so much at the mercy of the weather that it is folly to depend upon its covering the ground in any reasonable time. Give sufficient water to settle the soil about the balls of the plants the first warm morning after planting, and give no more until the soil becomes dry, unless warm drying weather should set in, and then a gentle sprinkling every morning will greatly benefit the plants.

HARDY FRUIT AND KITCHEN GARDEN DEPARTMENT.

Asparagus beds will be greatly benefited by liberal waterings with manure-water from the stable or farm-yard tank, especially where the "Grass" is weakly. Attend to recently planted beds, and water as frequently as may be necessary to keep the soil moist. Get in a good breadth of Knight's Dwarf Green Marrow Pea, or some other suitable variety for late crops. Situation has doubtless much to do with the proper selection of a variety for late bearing, but we have found nothing among the many new varieties which we have tried equal to this for resisting the attacks of mildew, and very few surpass it in quality. Get Tomatoes planted out against the walls, and Vegetable Marrows and ridge Cucumbers under the shelter of hand-glasses, also French Beans that have been raised under glass. Sow Cauliflower for late use, and attend to keeping up a regular succession of Spinach, Turnips, &c., and such things as are preferred in a young state, and do not overlook Lettuce, &c., for salad. Where the Gooseberry trees are badly infested with the caterpillar, if a quantity of Foxglove leaves can be procured and steeped in boiling water, and the water, when cold, strained through a cloth sieve, a syringing with this will effectually destroy the pest. But the fruit must not be used until after the trees have been well washed with rain. Attend to regulating the growth of trees designed to be trained in any particular form, stopping useless shoots, to throw more strength into those that are wanted.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON, For the week ending May 25, 1854, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 28th, 1817—therm. 91 deg.; and the lowest on the 29th, 1843, and 31st, 1852—therm. 34 deg.

Notices to Correspondents.

BOOKS: *Ballandyne.* The last supplement to Loudon was published in 1850.

DISEASES: *E W.* Your Rhododendron leaves exhibit dark brown spots with a paler cloudy border. The latter has clearly been caused by the infiltration of the diseased or decomposing matter of the darker central spots, however they may have been caused. We are inclined to think, however, that they do not arise from any constitutional disorder; but from the effect of some of the late spring frosts, for we have frequently seen leaves spotted from frost, while the rest of the surface remained uninjured; and there is no indication of any fungous growth in your leaves, which will probably fall; and if the injury is not very extensive, the plant will recover. If all the leaves are as badly affected as the specimens sent, the health of the plant may suffer materially. We fear that no other remedy can be suggested than to await the result with patience.—*M R.* The account you give of the state of the house in which your Passion-flower became diseased, during the months of October and November last, is such as to make it matter of surprise if many of your plants do not suffer. It might have been very possible then to have ascertained the origin of the disease, whether arising directly from damp, or indirectly from accidental circumstances, favoured by a cold, humid atmosphere. An earlier application of heat will probably prevent the recurrence of the malady, if the root is sound. —*J D.* Your Veronica leaves exhibit traces of disease on either surface. On the upper, the cuticle is separated from the subjacent parenchym in numerous distinct patches, while on the under surface, parallel with the midrib, the whole parenchym is disorganised and filled with colourless globules of various sizes, which are certainly not starch globules, though a few are intermixed, and, we believe, not the spores of fungi. At the same time the leaves are wasted in patches, with a dense varnish of honey-dew. The whole appearance seems to indicate too rich a supply of nutriment. The affection is, however, curious, and worthy of closer observation.—*W H L.* Your Vine leaves are affected with a disease very closely resembling that form of Geranium spot which is characterised by the presence of transparent tubercles amongst the withered specks. The fault lies probably partly in the state of the roots, and partly in the absence of the due intensity of light combined with low temperature during the past ungenial spring. We do not see any decided trace of mildew upon the leaves, but there are some specks which have a suspicious appearance, and we should strongly recommend you to be upon your guard. *M. J. B.*

INSECTS: *W B H.* The little beetles found in the seeds of a West Indian Ipomœa are a pretty species of Bruchus, apparently new. Their habits agree perfectly with those of the common Pea Bruchus, and other English species.—*H R C.* The blight on the Oleander leaf consists of vast numbers of specimens of different ages of the Oleander scale, Aspidiotus nerii (see *Gardeners' Chronicle* 1843, p. 588, for figure and description). We know of no surer mode for its destruction than brushing the leaves over with oil. The insects will certainly attack other trees.—*J H.* We found no trace of insects in your Apple leaves, and scarcely think the three you mention, like aphides, can have produced such an effect on them. *W.*

MOWING MACHINES. *A B C.* Shanks', we believe, does its work well; or, if you want a smaller one, try the Improved Ferrabee represented in our advertising columns at p. 39.

NAMES OF PLANTS: *Clifton.* Some kind of Saxifraga not determinable without leaves.—*Constant Reader.* The Christ's Thorn is Paliurus aculeatus, common enough in all large collections of plants. The Thorn you have sent is the American Cratægus punctata.—*H W H.* Halesia tetraptera.

ORCHIDS: *Corehouse.* Your Oncidium altissimum must have been a fine specimen. The flowers of your Moss Cattleya are certainly remarkable for size, and the Dendrobium densiflorum, with the number of blossoms you mention, must also be set down as a good example of skilful cultivation.‡

VALUATIONS: *Great Yarmouth.* We do not answer legal questions.

VINE LEAVES: *Vitis.* Your "scales" are dead places of the leaf itself, how caused we are unable to say; certainly not by the hot water pipes.

MISC.: *W E.* Is a botanist a florist? We really cannot tell. A surgeon may be a horse-dealer; a grocer may be a stock-jobber. The connection between such occupations is possible, but not exactly necessary. White Hellebore powder will kill the Gooseberry caterpillar certainly.—*Ballandyne.* We believe the Patagonian Beech is not in cultivation. No dead parts should be allowed to remain upon any living thing; plants suffer less than animals, but they do suffer after their kind.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PUBSER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

GUANO (PERUVIAN) AND CHEMICAL FERTILISERS.—NITRATE OF SODA; PERUVIAN GUANO; SUPERPHOSPHATE OF LIME; AGRICULTURAL SALT; AND CONCENTRATED MANURE FOR TURNIPS.
The above articles are supplied on the lowest Cash Terms, for best qualities only, on application to Mr. JOHN CLARANCE, Agriculturist's London Agent, 1A, Bishopsgate Street Within.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.
WM. INGLIS CARNE, 10, Mark Lane, London.

TURNIP SOWING, ETC.

GENUINE HALF-INCH BONES AND BONE-DUST may be had in any quantity of JARED TERRETT HUNT, Lambeth Wharf, Upper Fore Street, Lambeth, near Vauxhall Bridge. Also Superphosphate of Lime and Sulphuric Acid for dissolving Bones. J. T. H. also invites the attention of Gentlemen and Agriculturists in general, to his Superior Fine Bone-Dust for dressing Lawns, Parks, &c. Delivered to any Railway in London in Sacks.

TURNIP SOWING.

SUPERPHOSPHATE OF LIME, made from Bone, which is the best Manure for Root Crops (see the Royal Agricultural Society's Journal, Vol. vi., part 2). PERUVIAN GUANO, NITRATE OF SODA, BONE DUST, SULPHURIC ACID, and all other Manures of known value. The PEAT MOSS CHARCOAL COMPANY have appointed the undersigned Sole Agents for the Sale of this fixer and distributor of Ammoniacal matter. They are also Sole Agents (in London) of the Patent Sanitary Company for the sale of their "Nitrogenised Carbon."—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street London.

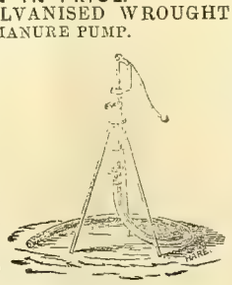
THE "ECONOMICAL MANURE."—A complete and by far the cheapest substitute for Guano; 1¼ to 1½ cwt per acre of this powerful Manure, costing 15*s.* to 18*s.*, is ample (more must not be used), and equals 3 cwt. of the best Peruvian Guano, thus saving at least 50 per cent., besides carriage, &c.
The agricultural world is respectfully urged to read the hundreds of Testimonials from all parts of ENGLAND, SCOTLAND, and WALES, FRANCE, BELGIUM, and SPAIN, to be convinced that this Manure warrants especial and immediate attention. They prove that it gave most wonderful results last year on every soil and crop, far surpassing the expectations of the purchasers, the dampness of this climate and the coldness of the soil peculiarly favouring its action on the vegetation. No one reading the Company's pamphlet can doubt its being by far the cheapest of all Manures. In fair comparative trials on every kind of soil and crop with guano, dung, and other long recognised fertilisers, it will be seen the "ECONOMICAL" was superior, that it proved most valuable for fruit trees, shrubs, and garden purposes, and produced the most astonishing effects upon manure heaps, applied in solution, decomposing in 15 days all vegetable matter, peat included, and that it is a perfect deodoriser for liquid manure, besides enhancing its fertilising properties. It is the result of many years' labour of an eminent Foreign Agriculturist, the Director of the Government Schools of Agriculture in his own country, and of high reputation as a chemist. It is patented, and is one of the most useful and greatest discoveries of the day.
Price 12*s.* per Cwt., packages included, and delivered free on rail or wharf in London.
The Company's pamphlet, containing the Testimonials, directions for use, and all particulars, also samples, to be had at the Offices of the British Economical Manure Company, 10, Mark Lane, London; or sent on applying to B. COVENEY, Manager.
Good Agents wanted.—An Allowance to the trade.
N.B.—Attention is called to the advertisement of the Company in this Paper of last week (p. 336), where numerous Testimonials in favour of the Manure, from all parts of the kingdom, both from this year's as well as last year's customers were given.
NOTE.—*The letters received daily at the Offices from this year's customers, fully support the high character this Manure obtained last year.*

REDUCTION IN PRICE.

WEIR'S IMPROVED GALVANISED WROUGHT IRON LIQUID MANURE PUMP.

The Fittings of these Pumps are wholly of Brass, and there is no leather or other matter which can be affected by the manure.

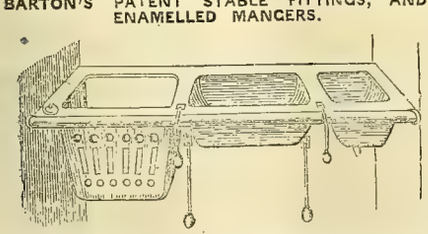
Price, complete, with 10 feet of Flexible Suction Pipe, 4*l.* 15*s.* Terms, cash on delivery.



EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London. Removed from Oxford Street.

Catalogues, with Illustrations, sent free by post.

BARTON'S PATENT STABLE FITTINGS, AND ENAMELLED MANGERS.

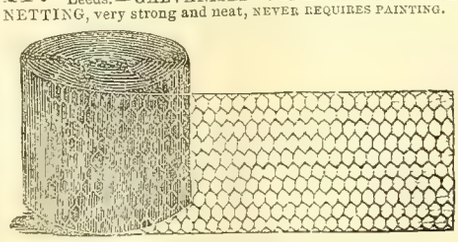


THESE FITTINGS have all the newest improvements, and are the only patented invention of this description. Improved Stable Fittings with Manger, Rack, and Water Trough attached, New Pattern Manger and Water Trough combined; also Corner and Straight Mangers, Plain, Enamelled, and Galvanised Stable Furniture of every description, Iron Gates, Railing, Hurdles, Sheep and Game Wire Netting, Registered Poultry Troughs, Fountains, Feeders, &c.—JAMES BARTON, IRONMONGER, &c., Manufactory and Warehouse, 370, Oxford Street, a few doors east of the Pantheon.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

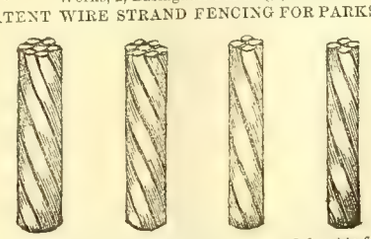
MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

H. J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.
GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.
Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

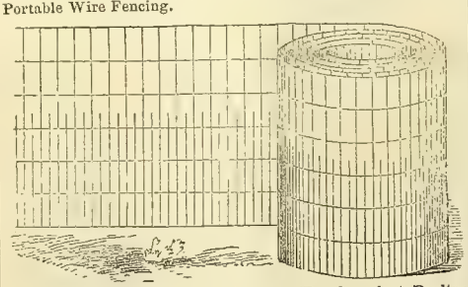
H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.
IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

AGRICULTURAL AND POULTRY FENCING, MANUFACTURED BY PATENT MACHINERY.
The great increase in the number and quality of POULTRY in the United Kingdom within the last few years has created a demand for an efficient Poultry Fence, which has called into existence every possible contrivance and adaptation of the Wire and Cord Netting, all of which have more or less proved failures.
B. GREENING & CO. have succeeded in supplying this acknowledged deficiency, by the introduction of a variety of their Portable Wire Fencing.



No. 11. PATENT DOUBLE FENCING (Proof against Poultry and Chickens).
This Fencing (which they manufacture by machinery, patented last year) is light, portable, and elegant in appearance, yet stronger and more durable than any Fence before the public. It requires few standards, and is fixed with the utmost facility by a labourer or gardener.
The following are the principal other varieties:—CATTLE FENCING, SHEEP AND LAMB FENCE, HARE AND RABBIT PROOF FENCING, ORNAMENTAL FENCING FOR GARDENS, TRAINERS FOR PEAS, GARDEN BORDERING, EXPORT FENCING, &c. &c., manufactured by Patent Machinery by BENJAMIN GREENING & CO.
1 and 3, CHURCH GATES, and 2, CATEATON STREET, MANCHESTER,
From whom every information, together with Prospectuses and Engraved Sheets of Patterns, may be obtained gratis.

SCYTHES.

BOYD'S PATENT SELF-ADJUSTING SCYTHE will last out three of the ordinary sort, and is always ready for use.
"We have seen this Scythe at work, and can strongly recommend it."—See *Mark Lane Express*, May 16, 1853.
To be had of every Ironmonger and Nurseryman in the kingdom; and wholesale and retail of WM. DRAY AND CO., Agricultural Implement Makers, Swan Lane, London.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*
WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

ST. MARGARET'S (NEAR RICHMOND) CONSERVATIVE LAND SOCIETY.—Rights of Choice on this valuable Estate are now on sale at the Offices, 33, Norfolk Street, Strand. The Register of the Rights to be disposed of is open daily for public inspection. The Allotment is fixed for WEDNESDAY, June 7.
CHARLES LEWIS GRUNEISEN, Secretary.

THE THIRD CHELTENHAM SUMMER POULTRY SHOW will take place at that magnificent establishment PITTVILLE SPA, on the 14th and 15th of June. For Prize Lists and full particulars enclose a stamped directed envelope to JESSOP BROTHERS, Secretaries.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1854.—THE SIXTH GREAT ANNUAL EXHIBITION of STOCK and DOMESTIC POULTRY will be held in BINGLEY HALL, on the 12th, 13th, 14th, and 15th DECEMBER next. The Prize List, and any further information, may be obtained from JOHN MORGAN, Jun.,
Office—38, Bennett's Hill, Birmingham. Secretary.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—PRIZE SHEETS for the LINCOLN MEETING may be had on application to the SECRETARY of the Society, No. 12, Hanover Square, London.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—The Royal Agricultural Society of England desires to receive Tenders from Innkeepers or others to Contract for the supply of a COLD DINNER, at LINCOLN, on WEDNESDAY, the 19th of July next, in the Society's Pavilion, constructed to accommodate 800 persons. Printed forms of Tender may be obtained on application to the Secretary, 12, Hanover Square, London, and must be returned to him, filled up, on or before SATURDAY, the 10th of June, the Society not binding itself to take the lowest Tender.
By order of the Council,
London, May, 1854. JAMES HUDSON, Secretary.

The Agricultural Gazette.

SATURDAY, MAY 27, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY,	June	1—Agricultural Imp. Society of Ireland.
MONDAY,	—	5—Central Farmers' Club.
WEDNESDAY,	—	7—Agricultural Society of England.
THURSDAY	—	8—Agricultural Imp. Society of Ireland.

IT is satisfactory to find that agriculture is to have a place among the professions, arts, and sciences which are to be illustrated in the CRYSTAL PALACE. They will not be all Londoners who shall crowd its passages and courts—instruction is to be offered to country folk as well as citizens—the various forms of manufacture, of which substances used as food and other agricultural products are susceptible, will be so arranged as to form "eye lectures" as perfect and detailed as those on any other of the manufactures represented there. Of this we have as yet no earnest in the building itself: indeed, that portion which is to be devoted to this department (the north wing) is still in an unfinished state. The agricultural department will be classed amongst the useful rather than the ornamental; and it is the latter rather than the former that is now being hastened to completion by the 10th of June. But we have a sufficient pledge of what the agricultural department is to be in the known ability of those who have the charge of it.

The plan of this department of the exhibition, which is due to Professor WILSON, to whom its execution also is deputed, involves the full representation of all the sections into which, as we lately (p. 202) stated, the subject naturally falls. Jermyn Street and Kew, as well as the intended museum of animal products, will all be represented in the Crystal Palace. The museum of economic geology, so far as agriculture is concerned—and, of course, in its other departments also—will be amply represented. Rocks, subsoils, soils, and their produce—vegetable and animal—will be exhibited so as to teach as strikingly as possible the connection existing throughout the whole, and their relation to the localities of which the several specimens are characteristic.

From the rock on which the whole is built up, to the most finished products—cheese or wool, that the farmer sends to market—no step in the progress, no collateral offshoot from any of these steps, will be left unillustrated. The student may wish to ascertain the agricultural wealth of England. Well!—beside every suite of specimens he will find a map of the country, coloured geologically for that particular produce, so that whether it be the district of any particular limestone, any mineral manure (as chalk, or coprolite, or marl), or possibly the district

of any peculiar crop, or of any breed of animal, its limits and extent shall at once appear. A quiet half-hour's study and examination will thus instruct more perfectly than a whole series of geo-agricultural lectures.

Or the student may wish to trace the soil through all its products, so that the whole agricultural produce of any one district shall be ascertained. Well!—he will find specimens arranged with this particular end in view, and the rock, subsoil, soil, the manure used to fertilise it, and the implements used to cultivate—it the seeds that are sown in it, the weeds which infest it, and the crops which are grown upon it—will all be represented. Sheaves of the various grains, wax models and actual specimens of the various roots, will be exhibited. Messrs. Lawson, of Edinburgh, have largely aided in providing these; and those of us who remember their contributions to the Exhibition in 1851, can have no doubt of the value of their contribution to the Exhibition now. Every variety of the Grasses and the grains in seed and straw will have its representative; and pursuing any one of these, as Wheat, for instance, to its ultimate purposes, we shall see the several products—of the miller, the starch manufacturer, the straw-bonnet maker, and even the paper manufacturer spread out before us. The higher products of the district, arising out of the consumption of its vegetable produce, will be exhibited in specimens of the animals so fed, of the cheese and wool they yield while living, and the skin, bones, glue, and other products of their carcases and skeletons.

Or the student may wish to trace any one of these ultimate products backwards through every stage of the process which its atoms must have traversed since they came from air and soil respectively. Let him take the article wool; he will find a series of specimens for his inspection, which, we are assured, is already marvellous for its completeness; he will also find specimens of all the different breeds of sheep in this country and in others—the names best known as breeders in the Southdown, Leicester, Cotswold, and Cheviot districts are contributors; and these specimens will be stuffed and otherwise prepared better than the scarecrows in the galleries of the British Museum. He will have an opportunity of studying the anatomy as well as the outer characters of the several breeds of sheep and cattle, for skeletons as well as stuffed specimens will be presented for his study. And travelling backwards further still, he will have to trace his way through specimens of all imported foods, and of foods prepared and grown at home; and thence to British soils, with the implements by which they are tilled, the manures by which they are fertilised, the rocks on which they rest.

Who shall say that the interests of agriculture fail of being represented here? A commercial company has seen the importance of an agricultural department, the management of it has been placed in first-rate hands, and that the importance of our national agriculture, the skill of our farmers, the interests of the agricultural student, will all be fully represented and attended to is plain from this imperfect sketch of the plan of operations; and also, though that is not yet apparent to the visitor at Sydenham, from the progress which we are informed has been already made towards its completion.

It is very clear that neither London societies nor London newspapers can put down roguery in the guano trade. The necessity of purchasing manures has spread much faster than the need of reading books and journals. We believe that the whole agricultural press of the country might unite in perpetual warning on the subject, and yet that there would be a very large number of farmers whom the warning would not reach—a very large extent of land over which the guano *manufacturer* should have unquestioned freedom to expatiate and deceive. What we call *publication* amounts, after all, to little better than confidential communication to a few of the more intelligent of the class addressed—precisely those of them, by the way, who least require the information given.

In adding another, therefore, to the many published instances of roguery in the guano trade, we are not particularly sanguine as to the good likely to be done. There was some good done in previous years when roguery was exposed, because then but few were purchasers, and those the more enterprising among farmers who were readers of our agricultural journals and newspapers; but now that every one who cultivates the land is a buyer in the guano market, a large proportion of them are beyond the reach of writers on the subject.

Perhaps local agency may be successful in disseminating information on the subject, though central agencies have failed. We were lately in a locality where the agricultural labourers and smaller farmers have been successfully induced to meet at monthly intervals during the winter to listen to a "reading" by one of the gentlemen of the neighbourhood, who on their part had undertaken in succession the task of selection and of preparation needed for the communication of information on such subjects as Australia—China—selections from Macaulay—the Geology of the locality. No better labourers' friend society could be devised than this—and if in every considerable district some among the more intelligent occupiers and landowners could be induced thus to attempt the instruction and amusement of their neighbours, they would, we are persuaded, prove one of the most efficient agencies in agricultural as well as in social progress. We believe that such institutions would be more efficient than newspapers and journals in the thorough dissemination of information of importance to the farmer. And in case any one at any of the ensuing monthly meetings of the Bitton village reading society to which we have referred, shall be disposed to take "the manure market" for his subject, we give the following letter as furnishing a suitable text for his discourse. It is addressed to us by Mr. H. J. Turner, Land Agent, Richmond, Yorkshire.

"Will you allow me to call your serious attention to the extensive adulteration which is just now being practised by the dealers in guano? Few people are aware to what an extent this nefarious business is carried on, nor how deeply many credulous farmers are fleeced. It is true that some of them are becoming awake on the subject, and show a good deal of skill in protecting themselves; but the bulk of them suffer unsuspectingly. I knew a case where two brothers bought of one dealer out of the same cargo; one used all his quantity, the other kept a bag. When pay-day came, the first-named paid in full; the other demurred, expressed doubts about the genuineness of the guano, thought he should have it analysed. I need not pursue the story further than to say, that, rather than have any inquiry instituted, the scoundrel of a dealer took *half* the amount of the bill and settled it in full.

"Another course has recently been adopted. Rascally firms in London get respectable tradesmen to become their agents in the country, and through them distribute worthless trash for Peruvian guano. Recently a friend of mine bought a parcel in this way, price 12*l.* per ton, cash down. Some doubts having arisen as to the article being genuine, it was submitted to Professor Way, and his analysis was as per copy inclosed.

23, Holles Street, May 10, 1854.

Analysis of a Sample of Guano.

Moisture	9.12
Organic matter and salts of ammonia	14.19
Sand and clay	48.87
Phosphates of lime and magnesia	16.10
Hydrated sulphate of lime ...	7.97
Alkaline salts	3.75
	100

Nitrogen, 3.14 per cent., equal to ammonia, 3.81 per cent.

Signed J. Thomas Way.

It is anything but a genuine article, and contains half of its weight in sand and clay. It is worth less than 4*l.* per ton.

"I could multiply cases; but I trust I have said enough to justify my request that you will use your influence to rouse farmers to a sense of the risk they run in buying guano—no matter how respectable the vendor may be—if they do not get it analysed."

Professor Way and the English Agricultural Society would do good service if they would cause to be published in detail every instance which passes through their hands of adulteration in manures. Such facts might not directly reach the more easily cheated among guano buyers, but they would rouse others to spread such information, so that at second hand it might reach those who needed it.

VISIT TO TIPTREE HALL.

(*Continued from page 326.*)

Adjoining the pasture is a field cropped partly with Wheat and partly with Oats. The Oats were sown after a crop of Mangold, liquid manure, and 2 cwt. of guano per acre, having been applied. This application, in addition to the tillage for Mangold, is certainly high farming, for under ordinary circumstances 2 cwt. guano alone must be considered a good dressing, the land being previously in a good state of tillage. The crop looked very promising, the land being well tilled, the corn drilled with great regularity, no deep wide furrows, but the plant of Oats good and even throughout—in fact there is every prospect of a full crop.

On the part adjoining, in Wheat, the plants looked strong and healthy, but very thin on the ground, the furrows bare, there being no plant of Wheat in the furrows for a space of 13 inches, and this must prove a great drawback upon the crop, when it is considered that the land is made up into 7-feet ridges. I can readily conceive that in strong land like this when undrained, small ridges may be requisite, but not deep furrows; here I find no mere slope of the soil, but a plain deep furrow or trench, exposing the bare subsoil, showing that the seed would not have grown had it been deposited therein. This is, however, evidently the fault of the ploughman, because in soils requiring small ridges in the undrained state, the best practice is to make the furrows shallow and narrow, and the ridges not too high backed, but only just sufficient to shed the surface water. The land now under consideration is not generally flat, but has a gradual incline, rendering the subsoil easy to drain, whilst the surface is not liable to wash or waste by the action of rain.

A piece of land with winter Tares growing, next attracted attention, and it was remarked that they were a fair crop, yet they were certainly not so gross as the winter Tares in general seen in Hampshire, and other parts of the country where no manure had been applied for that crop.

In passing out of the piece of Tares an open ditch was noticed, dividing it from the adjoining field, and it was asked what was the object of retaining an open dyke? The reason given was that the diagonal or cross drains emptied into it, and the adjoining field may be considered as only partially drained, but that it was intended to drain this land down the furrows, and in addition to the present cross drains, which it appears have not proved entirely efficient, and hence it was considered necessary to retain the small 7-feet ridges. These open ditches must have proved very disadvantageous in the tillage of the land; they might, however, have been in-laid with tiles, and made the leaders for the diagonal drains.

The next field was under Wheat, drilled, and it was certainly somewhat thicker in plant than the last field alluded to, yet in many parts it was very thin, and the ridges were of the same size as before mentioned. Inquiry was now made as to the quantity of seed Wheat used in the past seed-time, and it was stated that 6 pecks per acre only were used. This I consider too little by 2 pecks per acre, and in consequence I estimate the deficiency of produce at the next harvest at 8 bushels per acre upon the whole of the land under this crop. Part of this field was in fallow, intended for root crops, and it was in a forward state of tillage. On one side of this field was a heap of stable manure, &c., which had been cast up lightly, and, it must be admitted, would have been preserved in a more efficient state with less loss, had it been carted upon or covered with earth.

A piece of Beans came under observation next, and they were certainly a good plant, and well tilled, but a portion of this field showed that the draining done in it was not entirely effective, although it was said that the drains were placed 12 feet apart, and at the depth of 32 inches. I am of opinion that they have been placed in the wrong direction. The adjoining field was in Wheat, not looking so strong as that before noticed, but with a better plant upon the land. It was stated this field had not been in hand long, and it also required draining.

A field of Clover was next examined; it was thin of plant. The land looked poor, and was encumbered with Couch Grass. Here the liquid manure was being applied; but the land being undrained it was not expected that it would receive the full advantage from the application. This field, also, has only been a short time in Mr. Mechi's occupation. The next field seen was partly in Beans and partly Tares with Winter Barley mixed, both of which crops looked fairly, but not forward; the Tares and Winter Barley, it was noticed, had received an application of liquid manure to the growing crop, but the ridges being small and the furrows deep, they were calculated to draw the liquid away from the crop, whereas had the ridges been of a somewhat greater width, it might have been retained long enough to soak into the soil, and benefit the crop to a much greater extent. The advantage of a liquid application in this case was not exhibited, for the crop was decidedly backward, and not so good as the Tares in general in different parts of the country under ordinary management.

In returning towards the homestead, a field in finely tilled state was noticed, and it was ascertained that Mangold Wurzel had been recently drilled therein, at a distance of 2 feet apart between the rows, upon the flat; the preparation for this crop was stated to have been stable or box manure, forked into the land early in the autumn, at a cost of 2½*d.* per pole, and the work appeared to have been nicely executed. On approaching the farm buildings a pit was noticed containing a considerable quantity of stable and other straw-made manures, which had been recently turned over, and was in a state of excessive fermentation; this was said to be intended for application to the root crops; and, to render it advantageous for the purpose, it demanded more economy in its management; for the most volatile and valuable portion of the manure was rapidly escaping in the form of ammonia. I am not certain that every field upon the farm was seen; but quite enough was viewed to enable me to judge of the system adopted; and, taking the farm upon the whole, the general appearance showed that it was comparatively free from Couch Grass and root weeds.

It did not appear that any definite or regular rotation of cropping was pursued. The succession of crops, however, seemed to be judiciously arranged—the Italian Rye-grass being followed by a Pulse crop rather than cereals; the Wheat being sown after Beans, Clover, and root crops; the Lent grain, also, succeeding the root crop. The early sown root crops, such as Mangold Wurzel and forward Swedes, were prepared for by a winter fallow, and autumn tillage; but the later sowings of Turnips are preceded by a crop of Tares, &c. It was also stated that for some seasons past, half the farm had been sown to Wheat annually, and

although about the same proportion of land was now under cereal crops, yet about one-third was in Barley and Oats, about 12 acres of Beans and Peas being taken in addition.

Having arrived at the farm buildings, the first object which attracted attention was a capacious circular brick tank, with domed covering, stated to be 30 feet in depth by 30 feet in diameter; this, it appears, is made the receptacle for nearly all the manuring substances which accumulate on the farm—the manure from the bullock sheds and sheep-feeding apartments, from the fatting-pig sheds, and also the liquid drainage from the cart-horse stables, and pig-sties. Dead animals are also thrown in here, and their bones removed once in two years. In connection with this tank is an excellent and never-failing supply of spring water. Whenever the above manures are insufficient, guano is cast into the tank, and distributed over the land, being diluted as may be desirable. The means of distribution are certainly admirably contrived, and well adapted for the purpose. The contents of the tank are agitated, and propelled by steam power to any part of the farm, through pipes buried in the soil, and connected with a stop-cock, in or near the centre of each field, and it only remains to apply the gutta percha hose, which is of great length, and turn the stop-cock, when the liquid manure is driven with such force by the aid of steam, that it is raised high in the air, and falls like a shower of rain at a distance of 50 yards in advance of the conductor, who at pleasure walks across the field in any direction, insuring a regular supply to every part. *J. B., May* 14.

ON SOWING MACHINES.

(*Continued from p.* 328.)

1. When the seed is round, as in that of the Turnip tribe, or sufficiently round to admit of free movement among one another, as in that of some others of our cultivated plants, round holes of the requisite size in the circumference of a cylindrical vessel containing the seed, are all that is needed, with the gradual revolution of this vessel, to insure a tolerably even delivery of the seed. The machine is drawn over the land, and its wheels give motion to the cylinder, and the seed drops continuously, scattering evenly over the line of its progress. Two things, however, are needed to insure uniformity here; first, that the vessel be kept at a uniform degree of fulness, otherwise the passage of the hole under the body of seed, which of course preserves its position in the revolving vessel, will be longer at one time than another, and more will come out in a given number of revolutions, that is, over a given space of land traversed, at one time than another. This is dexterously insured in Moodie's Turnip sower, described in the sequel, by keeping the revolving seed cylinder always half full, the supply being kept up from a reservoir, connecting with the cylinder at its axis, and being, of course, possible only when the seed in the latter falls below the level of that axis. The second requisite for uniform delivery in this case, is a tolerably uniform and slow motion of revolution; when this becomes too fast, a centrifugal tendency is generated, and the seed flies out all round the cylinder; while, when slow, it can escape, as it is intended it should, only while the holes are below the seed.

2. The next method of delivery is by holes in the bottom of a fixed seed box, which holes are covered either by a revolving pinion, a revolving cylinder, or a revolving brush, inside. It is obvious that this method may be applied to a machine for a single line of seed, as it is in the ordinary Bean barrow, or to machines which are intended to cover a great width of land, and sow many rows at greater or smaller intervals alongside of one another; for the box may be very short, and have only one hole, with one brush, pinion, or cylinder for it, or it may be as long as you please, with holes at any intervals in its bottom, with a shaft lying over them, carrying pinions, brushes, or cylinders, placed so as to cover every hole, and so connected with the driving wheel, as that it shall revolve, and of course cause every brush to revolve with it, and thus insure a constant delivery of seed at every one of these holes. It is hardly correct to describe these holes as being in the bottom of the box; they are placed generally on one side of the box, and of course as low down as possible, in order that all the seed in the box may find its way out of them. In the cylinder plan, which may be taken first, each hole is perfectly covered; and were the cylinder unbroken, with a uniform surface, of course its revolution would not permit egress to the seed; but, instead of that, the surface is indented at regular intervals, the indentations being large enough to contain one or more of the seeds that are being sown. In the case of Bean sowers, where this plan is adopted, the holes or cups on the surface of the cylinder are large; in the case of Turnip seed they are very small; but whatever their size, it will be obvious, that, working as they do, not only in front of the exit hole, but in front of a small and stiff brush, which sweeps the surface of the cylinder as it revolves, successive cupsful, and no more, of the seed, whatever it be, are continuously carried round, and, presenting themselves at the open hole, fall out. This is a very excellent and regular method of delivery, insuring great uniformity and almost entire independence of such variations of speed as are likely to occur in the field. It is very commonly adopted in sowing machines. The pinion, when it is used in place of this cylinder, is, properly considered, a cylinder with larger cups or holes than ordinary; it is used for large seeds, or for abundant sowing; it is adopted in broadcast-sowing machines, where abundant seeding is deemed advisable and in machines for sowing Beans. The revolving brush, again, is used in the case of small seeds, such as Grass seeds. The rate of delivery per one revolution of the driving wheel is in ordinary cases regulated by the intervention of multiplying wheels of various power, so that the shaft shall revolve oftener or slower, and so a greater or smaller number of cupsful of seed be delivered over a given length of land; but in the case of the brush, whose efficiency as a deliverer of seed is not very materially, or at least not very uniformly, increased by increased velocity, the delivery of seed is regulated by increasing or diminishing the size of the exit holes behind which the brushes revolve; in this manner this brush may be used to sow Turnip-seed, even but 1 lb. per acre, Grass-seed 1 bushel, and larger seeds, 2 or 3 bushels per acre, without any alteration of velocity by multiplying wheels. And in one of the neatest broadcast sowing machines that we know, for Turnip and Grass seeds, this is the plan adopted.

3. The third mode of delivery is decidedly the best for regularity and uniformity of action, and it too is adapted for seeds of any size, and for any quantity per acre that may need to be sown. It is adopted in what are called Suffolk drills; and, generally described, it acts by cups attached to the projecting arms on a revolving disc, which cups, dipping into the seed, lift successive portions, each of which, falling from them as they attain the height of their revolution, is received into a funnel properly placed for its removal to the ground. On looking into the seed-box, the shaft carrying the revolving discs is seen across it, and with the discs strung upon it, and revolving in depressions in the seed-box. It may be observed here that this part is supplied with seed from a larger store in the box behind it. The discs revolve with the shaft, and as they revolve, little cupsful, at the end of the little cross arms, are dipped up from the store of seed, lifted, and fall into the open mouth of the funnel.

This disc may be similarly armed on both sides, and so supply two exit holes. It will be obvious that the shaft which carries it may be as long as you like, and carry any number of discs at any distance from one another, and so as long a box may be worked, and as great a width of land sown by one machine, as may be desired. It is also obvious that by the intervention of multiplying wheels of various power, any number of revolutions of the disc, that is, any number of cupsful, may be delivered down the funnel for every revolution of the driving-wheel; and it is plain that by the use of different "barrels," as they are called, that is, of different shafts, with cups of different sizes, the machine may be fitted for the sowing of any sort of seed. This, then, is the method of delivery adopted in our best sowing machines, and we believe it to be the best plan of delivery that has been devised. *J. C. M., in Blackie's Cyclopedia.*

Home Correspondence.

Agricultural Meteorology.—I have read the able defence of the rotatory theory of storms, which lately appeared in several successive numbers of the *Agricultural Gazette*, with the greatest pleasure. A very plausible explanation has been made out of those continual whirlings of the wind, that have been observed from very early times. It would be entirely out of the question to discuss this subject at length in this place, and therefore I refrain from continuing the explanation which "F. P. B. M." has given of the storm of 26th August, 1853. For my own part, however, I must say that the evidence led does not appear to me to prove the case. The rotatory theory, no doubt, as I have often admitted, gives a plausible but not a true solution of the phenomena of storms. And what is rather singular, I have scarcely met two individuals who hold the same opinion in regard to the explanation of some of the most common and characteristic phenomena of British storms. I consider that "a rotatory column of atmosphere, covering an area of 20° or 30° of longitude, and having a height of 30 or 40 miles," never occurs in our latitude. There is one point to which I would direct my friend's particular attention, viz., that South-east winds rarely extend more than *one mile* from the earth's surface in Britain; they are, in general, mere surface-adjusting currents that play a secondary part altogether in the atmospheric disturbances of the moment. The ordinary South-east winds bear about the same proportion to the total height of the atmosphere (say 50 miles) as the last *three* lines at the foot of this column in the *Gazette* bear to the column itself. Why, this very day (May 22) we have had a brisk South-east breeze, with rain, but this current is confined to a height little more than 2000 feet from the ground. Let "F. P. B. M." observe the next South-east wind which blows, and I dare say he will find that the same phenomenon will present itself. There is also another point worthy of being stated for the consideration of those who are satisfied with the rotatory hypothesis, that the closing North wind in storms usually extends to a height of four to five miles at least from the surface of the earth. These may be relied upon as facts, explain them best who can. With the greatest deference to those who hold an opposite opinion, I consider the rotatory theory has retarded the progress of meteorology. The mere veerings of the wind is not the prime difficulty; they can be much more satisfactorily accounted for by another supposition far more consistent with actual facts. I hope I shall be enabled before long to give my views on this subject in a far more extended form than it is possible to do in this place. I will take a leaf out of "F. P. B. M.'s" book, in the way of illustrating the facts by means of diagrams. If it was not trespassing too much on his kindness, which I have already more than once experienced, it would be a favour if he would state what are the causes and particular phenomena of the "storm's eye." How is the calm in the centre produced? Some will think that it is a pity that the Government of the day has not gone a little more heartily into the scheme of the United States, which has been so zealously prosecuted by Lieutenant Maury, to obtain a combination of meteorological observations. No doubt our own Government has aided the collection of observations, for a considerable sum appears to have been expended last year for this purpose; but we suspect it in some measure resembles the slothful man of old, who would not roast the meat which he took in hunting; in so far as there does not appear to be any proper provision made for having the results of so many observations turned to the best use in elucidating the laws which govern atmospheric phenomena. To reduce these observations to a simple form, in order that the results might be seen at a glance, would not be a very difficult matter, if it was done day by day; but on the other hand, if a great accumulation of materials is allowed to take place, no one would have the courage to encounter such a mass. This is an interesting subject in relation to agricultural statistics, and glad were we to see that it was not forgotten in the discussions on that question. At a future period we may recur to this particular point more in detail. *R.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Audit of Accounts, *May* 19.—The accounts were examined, audited, and certified as correct, by Mr. Raymond Barker, V.P., the Chairman of the Finance Committee, and by Mr. Knight, Mr. George Raymond Barker, and Mr. Dyer, the Auditors on the part of the Society.

Special Council, *May* 19.—Sir John V. Shelley, Bart., M.P., Trustee, in the Chair. On the motion of Mr. Raymond Barker, seconded by Mr. Thompson, the report of the Council to the ensuing general meeting of the Society was taken into consideration and agreed to.

General Meeting.

The half-yearly General Meeting was held at the Society's House in Hanover Square, on Monday last, the 22d of May, Mr. Raymond Barker, V.P., in the chair.

On the motion of Mr. Raymond Barker, seconded by Mr. Fisher Hobbs, William Miles, Esq., of Leigh Court, M.P., was unanimously elected the President of the Society for the year ensuing the Lincoln Meeting.

The Trustees and Vice-Presidents were re-elected, and the house-list of the Council unanimously adopted. The following new members of Council were elected:—Sir Watkin Williams Wynn, Bart., M.P., Sir Charles Gould Morgan, Bart., Sir Stafford Henry Northcote, Bart., Sir Archibald Keppel Macdonald, Bart., and Chandos Wren Hoskyns, Esq.

The Secretary read the following report from the Council:—

REPORT.

The Council have to report to the Society at its present half-yearly meeting, that, since December last, the names of 88 members have been removed from its list by resignation or death, while, during the same period, 175 new members have been elected from the following localities:—

Lincolnshire	29	Cumberland	2
Middlesex	19	Dorsetshire	2
Gloucestershire	16	Essex	2
Lancashire	6	Herefordshire	2
Surrey	6	Hertfordshire	2
Hampshire	5	Leicestershire	2
Kent	5	Monmouthshire	2
Northamptonshire	5	Rutlandshire	2
Suffolk	5	Staffordshire	2
Sussex	5	Cheshire	1
Yorkshire	5	Cornwall	1
Derbyshire	4	Huntingdonshire	1
Devonshire	4	Shropshire	1
Norfolk	4	Westmoreland	1
Nottinghamshire	4	Worcestershire	1
Oxfordshire	4		
Somersetshire	4	Wales	4
Berkshire	3	Scotland	4
Warwickshire	3	Ireland	5
Bedfordshire	2		

The Society now consists of a total amount of 5177 members, comprising—

88 Life-Governors,
146 Annual Governors,
771 Life-Members,
4152 Annual Members, and
20 Honorary Members.

The Council have elected Sir John Villiers Shelley, Bart., M.P., to fill the vacancy in the class of Trustees occasioned by the lamented decease of the Hon. Robert Henry Clive; and they have taken measures for extending to the principality of Wales, and to the counties of Lancaster, Warwick, and Monmouth, that representation in the Council to which they would seem to be entitled, on account of the large proportion of members of the Society residing within their respective districts.

The invested capital of the Society consists of 10,764*l.* Stock in the Three-and-a-Quarter per Cents.; every claim against the Society presented in a complete form for payment has been discharged; and the arrears of subscription have assumed during the last few years a much more reduced and manageable shape. The subscriptions remaining unpaid from the 1st of January, 1853, amount to 840*l.*, and are now in the course

of collection; while those which remain unpaid from the 1st of January in the present year, amount to 2994*l.*, and will no doubt in a short time be duly paid up and available for the current purposes of the Society. The Council appointed in February last a special committee for the purpose of conferring with the Finance Committee on the best means to be adopted for placing the financial arrangements of the Society under a more economical system. That committee, having instituted a searching inquiry into every branch of the Society's expenditure, has this month made its report to the Council, who have the satisfaction to find that no unnecessary outlay appears to have been incurred in carrying out, under the orders of the Council, the various operations of the Society. As a large amount of shedding, however, has frequently been provided, at great expense to the Society, for the express accommodation of stock and implements which have not been sent to the show according to their original entry, the Council have adopted the special recommendation of the committee, that all persons who shall neglect to pay in due course the stated fines incurred for such non-exhibition, shall be debarred from exhibiting at the future country meetings of the Society.

At the Lincoln Meeting, to be held in the week commencing Monday the 17th of July, the Council anticipate a large and important agricultural assemblage. The entries of implements and machinery are as numerous as in former years; and their trial will on that occasion for the first time be open, under certain regulations, to the public, from the noon of Thursday in the previous week. The dinner of the Society will take place in a pavilion constructed to accommodate 800 persons. The Council last year appointed a committee to report suggestions on the subject of that over-fed condition of animals which, in many instances at previous meetings, had been animadverted upon as being inconsistent with their value as stock intended for breeding purposes. The arrangements, however, made by that committee have not attained the object in view. The disqualifications pronounced at Gloucester were not eventually confirmed in every case; animals apparently over-fed at the time having subsequently been proved to be breeding stock. The Council have, therefore, reverted to the Society's original rule of placing on the judges of the show the responsibility of awarding the prizes to those animals which, in their opinion, are best adapted for the purposes of breeding. Professor Simonds, the veterinary-inspector of the Society, having instituted at its country meetings a complete comparison between the certified ages of the cattle, sheep, and pigs exhibited on those occasions, and the developments of their growth, has recently delivered before the members the first part of his lecture on that subject, in which he has shown within what high feeding and other causes will accelerate the development of the teeth in cattle, and has thus furnished us with the ready means of clearing up doubts, that have hitherto frequently arisen at the country meetings, in reference to the exact age of animals competing for the prizes of the Society. The subject of the feeding of animals continues to engage the attention of Mr. Lawes, whose recent experiments, placed on record in the pages of the Journal, supply still further evidence of the labour and expense attending investigations of that kind, and which can only be duly estimated by those who, like Mr. Lawes, have undertaken them on a large scale for the public good.

The district for the country meeting of the Society in 1858 has been decided by the Council, on representations made to them by large and influential deputations from North Wales and the county and city of Chester, to be comprised of the whole of North Wales and the counties of Chester, Stafford, and Salop.

The Council feel deeply indebted to the Earl of Clarendon, H.M. Principal Secretary of State for the Foreign Department, for the personal interest he has taken in promoting the objects of the Society, by instituting such inquiries abroad as might lead to the discovery of supplies of guano, or of the alkaline and earthy nitrates in Mexico and other tropical districts; also, to Sir James Graham, who, as first Lord of the Admiralty, has directed extensive search to be made by her Majesty's ships cruising within the tropics, for those or any other natural deposits that might prove advantageous as manuring matter. They have at the same time to acknowledge the continued interest evinced in their proceedings by Viscount Palmerston, H.M. Principal Secretary of State for the Home Department, and his lordship's kindness in communicating to the Society, from time to time, whatever information may appear in any degree conducive to the advancement of agriculture in this country. The Council have reason to hope that the public attention, which 17 months ago was called to the importance of a substitute for guano, by the prize offered by the Society, has not been entirely unavailing; for such a discovery, although within the range of physical possibility, was not to be expected at once to reward the investigation of the chemist, or the extended research of the naturalist. The general consideration, however, which this subject has now received has led to the closer study of the action of manuring matter, and to a more exact estimate of the conditions under which such a substitute may most favourably be produced. These inquiries have confirmed the essential importance of phosphoric acid and ammonia, and pointed out sources from which it is hoped that cheaper supplies of the latter substance may be obtained. One hundred and forty-three applications have already been received from different parts of the United Kingdom and foreign countries, claiming the prize offered by the Society. Each of these claimants professes to supply a manure equal in fertilising properties to Peruvian guano, at a price not exceeding 5*l.* per ton, and in quantities sufficient for all demands. Before, however, the Council can proceed to the consideration of these claims, they require a compliance with all the conditions under which the prize was offered; and until the most undeniable evidence of the true value of any competing manure has been produced, and subsequently tested if necessary by special trials, the Society may feel assured that the Council will take no step on this important subject that may tend in any degree to mislead its members. Professor Way, the consulting chemist to the Society, has recently delivered before the members a lecture on the manufacture of artificial manures, highly suggestive of sources whence supplies of manuring matter may be derived, and of improved modes of its manufacture into artificial mixtures for special crops. He reports from his own experience that the amount of adulteration in guano and other manures at the present time is greater than at any former period since his connexion with the Society, the adulterating material amounting in many cases to three-fourths of the whole compound sold to farmers as genuine manure.

The Council, in conclusion, congratulate the members on the clear gain of 254 more names on its list at the present time than at the same date in last year; and they are assured that the Society will not, on this occasion, review its own prosperity, and the gradual fulfilment of its practical and scientific objects, with less satisfaction, when informed that the collateral progress of the same national cause of agricultural improvement is advancing with equal steps in the sister-kingdoms of the empire.—By order of the Council,

James Hudson, Secretary.

On the motion of Mr. Wingate, seconded by Mr. Barugh Almack, the report was received and adopted. The business of the meeting was then concluded by the usual votes of thanks to the auditors, to Professors Way and Simonds, and to the chairman.

Weekly Council, *May* 24: Mr. Raymond Barker, V.P., in the chair. Prof. Simonds, the veterinary inspector of the Society, resumed and concluded his lecture on the ages of animals as indicated by their teeth. He confined himself on that occasion to the teeth of the sheep and the pig. This subject, as before, was elucidated by reference to admirably coloured diagrams on a large scale, and to a considerable number of anatomical specimens, exhibiting the structure and relative position of the teeth of those animals, at different stages of their development, as well as to tabular statements of age at different periods of growth. Having entered into interesting details connected with the distinctive character of the teeth in those animals, and described the mechanical provisions affecting the chewing of the cud in ruminants, he gave the result of his examinations in reference to the tusks of the pig, and the influence of breed, sex, or castration, in modifying their development, which, taken alone, he considered a very uncertain criterion of age in that animal. He dwelt on the peculiar character of simple and compound, and the temporary permanent teeth in sheep and pigs. He pointed out the remarkable effects of breeding and feeding in forcing the growth of teeth, and the total incorrectness of the rules hitherto given on that subject. He referred to the great importance of exact data on that point in guarding agricultural societies from fraud when prizes were intended to be awarded to animals of distinctly assigned ages. The results he then laid before the Society were deduced from a comparison of 2000 examinations, and it was only from the opportunities he had possessed, as the Society's Veterinary Inspector, that he had been enabled to make so extensive and satisfactory an investigation. He believed the facts he had obtained in the case of the pig to be perfectly new. He referred to the singular circumstance of the pig being born with a certain number of teeth already developed; to the peculiar formation of its tongue, which by means of a fringe had the power of retaining the nipple strongly in its mouth, without injury from the teeth, while in the act of sucking; to the particular ages at which the pig loses and gains certain teeth; to the errors connected with the ordinary modes of estimating the age of pigs by the tusks alone; and to the importance of connecting both the tusks and the incisors in forming a just conclusion on that point. He cited striking instances how accurately a person might now determine the age of pigs from the new data his researches had furnished. He concluded by stating that he believed the facts he had been enabled, as one of the officers of the Society, to submit to the members, had not only been justly deduced from the numerous investigations he had made, and were therefore founded on natural circumstances, but that they were nearly altogether novel in a physiological point of view; and that the development of the teeth of cattle, sheep, and pigs, arising from superior food and improvement in their breed, as well as greater care and attention bestowed generally upon their management, was much earlier than had hitherto been supposed.

Mr. Miles, M.P., in moving a vote of the best thanks of the meeting to Professor Simonds, for his admirable lecture, remarked, that nothing could show more clearly the advantage of a society like their own, than the opportunity it had afforded to their veterinary inspector, to collect, from numerous original sources, the great amount of valuable practical information that had resulted in the important data then submitted to them, in reference to the age of the sheep, and especially in the novel, striking, and connected facts illustrating that subject, hitherto so little understood, the dentition and age of the pig. He had not been able to be present at the first part of the lecture given last week, but if that had been as good as the one he had then heard, he had no hesitation in saying that Prof. Simonds had fully maintained, and still further confirmed, his high character for scientific attainment. Sir Robert Price, Bart., M.P., seconded the vote, which was carried unanimously; the Chairman remarking that the members would perceive that no assertions were made uncorroborated by evidence; and that he, as the chairman of the Veterinary Committee of the Society, entertained at all times the fullest appreciation of Prof. Simonds's services.

Dublin Chemico-Agricultural: *Feeding for Pigs.*—Mr. John Andrews read a valuable paper, giving an account of some interesting experiments which he had undertaken, in conjunction with his brother, for the purpose of testing the relative advantages of cooked and fermented food for pigs. The result of the experiment showed that cooked food was decidedly preferable to fermented food, as prepared according to the plan of Messrs. Bushe and Barter, who have patented machinery for the purpose. In the intestines of the pigs fed upon the fermented food, after they were killed, myriads of white worms were found, some of them being as thick as a quill, and three-quarters of an inch long. The worms, it was believed, retarded the growth of the pigs. —Mr. Anderson: I think the fuel used in preparing the food a very expensive item. During the last season, I fed 375 pigs. I use turf in the beginning of the season, but coal latterly. I have the advantages of steam and good troughs, but, notwithstanding all, the item of coal is very expensive. The coal costs me 22*s.* per ton, but I am sure it would be much cheaper here. We import the coals at Portrush, and have to cart them nine or ten miles. Turf, latterly, has been very dear; and, in consequence of the number of people who have left the country, there is little cut in our neighbourhood. —Dr. Hodges said he might mention, in connection with Mr. Andrew's paper, that an elaborate series of experiments had been conducted on the subject by Mr. Lawes, assisted by Dr. Gilbert, and the results were published in the Journal of the Royal Agricultural Society of England. The experiments were instituted for the purpose of discovering the relative value of mixtures of certain approved foods of different kinds in feeding, such as Beans, Bran, and Indian Corn. The results extended over 80 pages, and they were exceedingly valuable as facts relative to feeding. Mr. Andrews' paper, he believed, was one of very great importance in connection with them; and to no two gentlemen in this country could the investigation of such a subject have been intrusted with more propriety than to Mr. Andrews and his brother.

Guano.—Six samples of guano, which had been sent for examination by parties retailing it, were then brought under the inspection of the meeting. They had been analysed by Dr. Hodges, and only two of them turned out to be genuine. One of the samples was of a kind that was sold at the rate of 13*l.* per ton, but was only value for about 3*l.* per ton; another contained 54 per cent. of adulteration. Dr. Hodges said it was the "very perfection of adulteration;" neither by smell nor by the colour could its spurious composition be detected.

Miscellaneous.

Influence of Shelter on quality of Manure.—A steading entirely covered in effects a great saving in farm produce, which must otherwise be exposed to the injurious effects of the weather, while the amount consumed and destroyed by the stock is considerably less; but the most remarkable result of my experience is in the value of the manure. In October 1850 the yards were filled with 14 feeding bullocks, getting the same quality of food as another lot of 18, tied up in the byre, and whose manure was put out into an open court. In the open court were 12 young animals, getting a full allowance of Turnips. The feeding beasts were all of the same age, viz., two off and rising three years old; fed twice a day on Turnips, of which each got about 1 cwt., and once a day on steamed Swedes mixed with cut chaff, and 2 lbs. of Barley-meal mixed with a little Linseed, or 3 to 4 lbs. of oilcake—of this mess each got 22 lbs. Both byres and courts were littered twice a day; and, as near as we could judge, each animal got the same allowance of straw, and all had a constant supply of Oat straw in their racks. From the foregoing particulars it will be seen that the manure thus made should have been about equal. During the winter of 1850-1 the manure in the open yard was carted to the field selected for the experiment, and put in one large heap of 200 loads, well pressed down by the carts driving over it when emptying, and then covered top and sides with earth and road-scrapings. It lay thus till a week before using, when it got a turn over in the usual way. The dung in the covered yard had been allowed to collect all winter, was carried direct to the field, and put into the drills, without any turnings, being quite well enough made for the crops intended. A field of 20 acres, of very equal quality, being a rich loam lying on the trap, naturally dry, and in good heart, exposed to the south, at an elevation of from 80 to 100 feet above the sea, was selected for the experiment, and divided into two equal portions. The manure applied was at the rate of 20

-loads per acre. The whole field was planted with atoes; the seed all of one kind, from one field gents); planted first and part of second week of il. All brairded well, and showed no difference in vth till the first week of July, when a decided su- lority began to manifest itself in the half of the d manured out of the covered yards. The shaws on portion of the field manured by the dung from the n courts began to decay by the latter end of July, by the second week in August were nearly all gone, lst the other portion of the field still retained its ng dark green. The crops were taken up on the 1st lth of October, after two separate portions in each f had been carefully measured and weighed, the result ng as follows. I may mention that disease showed lf more especially in the heavy crop.

Uncovered Dung.

	Tons.	cwt.	lbs.	
measurement.—1 acre produced ...	7	6	8	of Potatoes.
measurement.—1 acre produced ...	7	18	99	„

Covered Dung.

measurement.—1 acre produced ...	11	17	56	of Potatoes.
measurement.—1 acre produced ...	11	12	26	„

As soon as possible after the Potatoes were lifted, the d was cleaned, ploughed, and (on the 22d to 25th of tober) Fenton Wheat was drilled in, at the rate of ushels per acre. The same portions of each half asured in the Potato experiment were marked off for al with Wheat. As soon as the weather suited in ing the whole field got a dressing of 3 cwt. of ruvian guano per acre. During the winter very little ference was apparent; but, shortly after the applica- n of the guano, the crop on that portion manured by e covered dung took a decided lead, which it retained summer. The whole field was cut the 26th of igust, 1852; the portion manured by the uncovered ng being at least 4 days earlier than the other. As fore, the two separate portions in each half of the field re measured, cut, and stooked separately; on the h of September each portion was threshed, the grain refully measured, and the straw weighed. The weather ving been rather wet, the grain was soft, and not in od order; this will account for the light weight per shel. The light crop beat the heavy crop in quality ½ lb. per bushel.

Calendar of Operations.

MAY.

LAMMERMUIR SHEEP FARM, *May* 16.—The lambing season is ow over, and, from the fine weather, has been an unusually vourable one. Seldom in this range of hills has it been got over ith so little trouble or anxiety. During the whole time we had course of bright sunny weather, and weakly lambs, after bask- ng a short while, were on their feet and vigorous. The ewes ad abundance of milk, and so we have scarcely had an instance f one refusing or appearing careless about her lamb. Though n upland farms the number of twins has not been above an verage, yet from the casualties having been so small, the crop f lambs is full. Cheviot lambs are usually castrated at the age f three or four weeks, and their tails cut to the proper length. A long tail is a great improvement to the appearance of the heviot sheep. It should be long enough to touch and dangle on he hock. Black-faced lambs are not castrated till they are bout six weeks old. The object of this is to let the horns bud roperly, for when done sooner the growth is checked. For this peration a moist day is the most suitable, and great care must e taken, in putting the lambs into the sorting folds, not to hurry r overheat them. Some farms are much more liable to in- lammation than others, and on these there is sometimes a con- iderable loss of lambs. The weather continues fine, and hill astures now look fresh. Grass was fully a month earlier in this istrict than it was last year. Prices of lean stock are advancing, nd at a market held in Dunse yesterday, hogs met a good emand. *Lammermuir.*

Notices to Correspondents.

AVERAGE ORGANIC COMPOSITION OF FOOD: *Sub.*

	Water.	Husk.	Starch, Gum, Sugar.	Gluten, Albumen, &c.	Fatty Matter.	Mineral Matter.
Wheat	15	15	55	10 to 19	2 to 4	2
Barley.....	15	15	60	12 to 15	2 to 3	3
Oats.....	16	20	60	14 to 19	5 to 7	4
Indian Corn	14	6	70	12	5 to 9	1½

This is taken from Johnston. The figures are intended to represent per centages, but in the case of some there is an obvious inaccuracy. In the case of Oats, for instance, 120 parts are given instead of 100, and the number probably ought to be—water, 14; husk, 17+; starch, 50; gluten, 11 to 16; fatty matter, 4 to 6; mineral matter, 3½.

BUTTER: *A B C.* Rancidity is due either to the cheesy part of the butter or to the oxygen of the air. The fatty part of the butter and the milk sugar present in it become, simply by contact with decaying curd, converted into butyric and other offensive acids. To preserve butter, therefore, the milk should be separated perfectly by washing in perfectly pure water. And as the tendency of the curd to decay, on which almost all the mischief depends, is checked or retarded by the presence of saturated solutions of salt, sugar, &c., about 1 of salt to 25 of butter should be thoroughly incorporated, so that there shall be no particles of the cheesy part of the butter which shall not be in contact with salt. If you exclude the air, the presence of a saturated solution of salt will not only preserve the cheesy matter from itself undergoing decay, but will render it also unable to induce decay in the sugar and the fat in contact with it. (*See Johnston's Agricultural Chemistry.*)

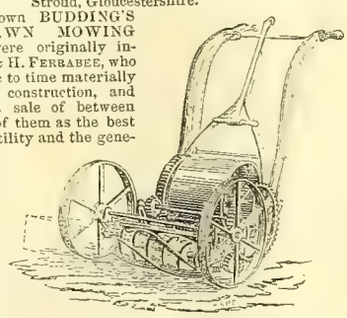
TO PUT A COW DRY: *J L.* The plan is to avoid succulent food, and gradually to cease milking; at first diminishing the frequency of the milkings, and ultimately entirely discontinuing them.

ERRATUM.—For "sulsates," line 21 from the bottom of column *b*, page 29, read "sulphates."

PROTOXIDE ANTI-CORROSION PAINT, for all external purposes, on iron, wood, brickwork, or stucco, is cheaper, and more durable, than any similar article.—Manufactured by CHARLES FRANCIS & SONS, Cement Works, Nine Elms, London.

THE IMPROVED LAWN MOWING MACHINE, MANUFACTURED BY

J. AND H. FERRABEE, Phœnix Iron Works, near Stroud, Gloucestershire.



The well-known BUDDING'S PATENT LAWN MOWING MACHINES were originally introduced by J. & H. FERRABEE, who have from time to time materially improved their construction, and can refer to a sale of between 4000 and 5000 of them as the best proof of their utility and the general satisfaction which they have given.

The Machines offered this year by J. & H. FERRABEE are superior to any yet produced, being perfectly adapted for cutting the Grass on Lawns and Verges, and between flower beds; while their strength and durability have been increased and their management simplified. Any person can use them effectually without the least practice. They can be adjusted to cut various lengths of Grass, and will produce a more even and uniform surface than the most skilful mower. The Grass is cut best when dry, so that a machine can be employed at the most convenient time to the workman, and more than double the work may be done with the same manual labour that is requisite with a scythe.

SIZES AND PRICES.		£ s. d.
Hand Machine, for One Man, cutting	16 inches wide	5 15 0
Ditto for Two Men, „	22 ditto ...	6 10 0
Pony Machine, „	28 ditto ...	10 0 0
Horse ditto „	36 ditto ...	16 0 0

The Horse Machine will cut the longest and coarsest Grass usually met with on Lawns and Pleasure Grounds.

London Agents:—Messrs. BOULNOIS & SON, Baker Street Bazaar, Portman Square.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£ s. d.
Patent Pump	1 15 0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3 0 0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

JOHN WARNER AND SONS CRESCENT, JEWIN STREET, LONDON.

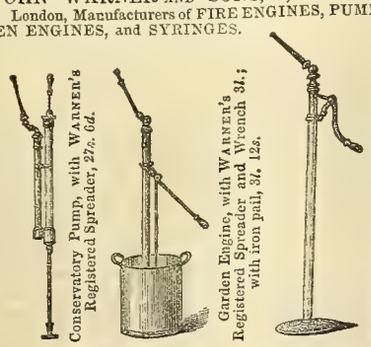
GALVANISED IRON TUB GARDE ENGINE,

With Warner's Registered Spreader,

Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.



Conservatory Pump, with WARNER'S Registered Spreader, 27s. 6d.
Garden Engine, with WARNER'S Registered Spreader and Wrench 31.; with iron pail, 3l. 12s.
Patent Conservatory Pump, with WARNER'S Registered Spreader, 2l. 13s.; with iron pail, 3l. 5s.
No. 32.
No. 11.
No. 14.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturist for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

No. 12 „	24	„	„	45	„	...	5	0
No. 14 „	30	„	„	45	„	...	5	18

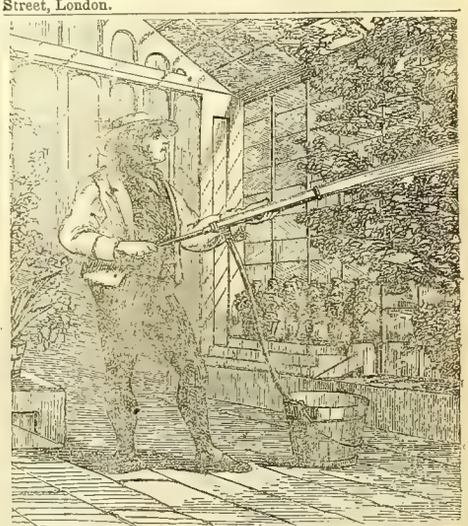
A large assortment of every description of Garden Syringes Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.



J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, ETC.

JAMES LYNE HANCOCK'S VULCANISED INDIA-RUBBER TUBING is now manufactured especially for the above purposes, and is of greater flexibility than any other description of hose or tubing. It is also manufactured to resist great pressure, suitable for attaching to the mains of water works or to tanks, or water butts of high elevations. WATERING HOSE fitted up with brass joints, branches, stop-cocks, roses, and jets complete. Vulcanised India-rubber suction pipes for pumps any length or size to order; HOSE for brewers' use, fire engines, &c. VULCANISED INDIA-RUBBER WASHERS, for Steam and Water Joints, and VULCANISED RUBBER in sheets of any size and thickness. Solid vulcanised India-rubber Tubing and Cord, for the joints of glass-doors, sashes, frames, &c.—Prices and every information may be had on application at the Manufactory, Goswell Mews, Goswell Road.

COTTAM AND HALLEN,

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, HYDRAULIC ENGINEER, 70, Strand, and Bridgefield, Wandsworth.

RIPE FRUIT, STRAWBERRIES. AND SEED BEDS.—New Twined Netting (tanned if required), 1 yard wide, 1½*d.* per yard; 2 yards wide, 3*d.* per yard; 4 yards wide, 6*d.* per yard; ½-inch mesh do., 2 yards wide, 6*d.* per yard. The Elastic Hexagon Garden Netting, 76 meshes to the square inch, effectually excludes birds, wasps, flies, &c., from fruit trees, flower or seed beds, 4½*d.* per square yard. Tanned Netting, 2 or 3 yards wide, 1½*d.* per yard; 4 or 6 yards wide, 3*d.* per yard, exactly the same as advertised by others at double the above prices. Coir or Hemp Sheepfolding Net, of superior quality, 4 feet high, 4*d.* per yard. Lamb Net, 6*d.* per yard. Rabbit Net, 1½*d.* per yard, 4 feet wide; each edge Corded, 2*d.* per yard, suitable for fowl fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for fencing against fowls, cats, &c.

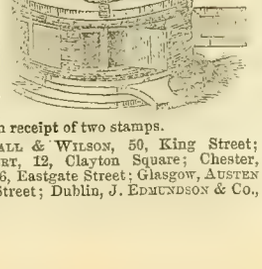
The largest, cheapest, and best stock in the world, at W. CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond Road, Kingsland, London. The Trade supplied. Orders by Post punctually attended to. Fishing Nets of all kinds in stock.

BEES AND HIVES.

MARRIOTT'S HUMANE COTTAGE BEE-HIVE, for taking honey without killing the Bees, is the best for practical use. Newly illustrated Catalogue forwarded for penny stamp.—MARRIOTT, Apiarian, Surrey Zoological Gardens; City Warehouse, 24, Fish Street Hill, London Bridge.

BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.



This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, F. & A. DICKSON & SONS, 106, Eastgate Street; Glasgow, AUSTEN & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

LADDERS, BARROWS, ETC.

G. ELL invites the attention of Agriculturists, Builders, and Decorators, to the large stock of LADDERS, EXCAVATORS, BRICKMAKERS, AND GARDEN BARROWS, TRESTLES, STEPS, &c., he has always on hand at a very low scale of charges. A list of prices will be forwarded on application.—Manufactory, 3, Tottenham Court New Road, opposite Hampstead Road.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening Pursuits, are invited to examine DEANE, DRAY, AND CO.'s extensive Stock of GARDENING and PRUNING IMPLEMENTS, best London-made Garden Engines and Syringes, Colebrook Dale Garden Seats and Chairs.

DEANE, DRAY, AND CO. are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with their Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom. Also wholesale and retail Agents for SAYNOR'S celebrated PRUNING KNIVES, used exclusively by the first Gardeners in the United Kingdom.

DEANE, DRAY AND CO. (Opening to the Monument), London Bridge. ESTABLISHED A.D. 1700.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

MORNING FROSTS.

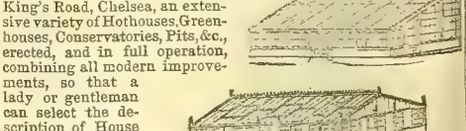
"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Removing to 112, Regent Street, London.)

JOHN WEEKS AND CO., HORTICULTURAL BUILDERS, King's Road, Chelsea, think it now necessary to inform the Nobility, Gentry, and Public in general, that they have NOT HAD ANY CONNECTION WHATEVER with the Bankrupts Edward and Alfred Weeks, who LATELY carried on business at Chelsea.—May 27, 1854.

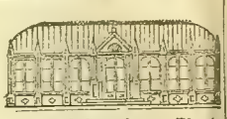
HORTICULTURE IN ALL ITS BRANCHES.

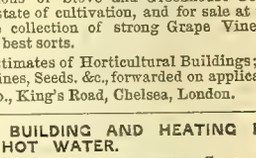
J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Building or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.





The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

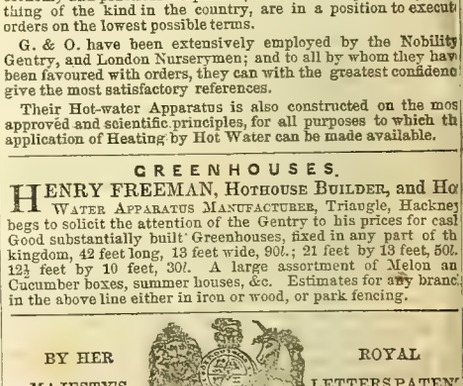
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds. &c., forwarded on application

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by any thing of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER, and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney begs to solicit the attention of the Gentry to his prices for cash Good substantially built Greenhouses, fixed in any part of the kingdom, 42 feet long, 13 feet wide, 90*l.*; 21 feet by 13 feet, 50*l.* 12½ feet by 10 feet, 30*l.* A large assortment of Melon and Cucumber boxes, summer houses, &c. Estimates for any branch in the above line either in iron or wood, or park fencing.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq. Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as sloes were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glas alone E. D. has Roofed the Public Baths and Washhouses, Endell Street on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

HARTLEY'S PATENT ROUGH PLATE GLASS, 1-8th thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th, or 4 lbs. to the foot, for Ridge and Furrow Roofs, Greenhouses, Railway Stations, Engine Sheds, Mills, Market Halls, and Public Buildings generally.

For further information apply to JAMES PHILLIPS and Co., 116, Bishopsgate Street Without.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

"Rough Plate Glass.—We should have no hesitation in using this for a Vinery—indeed we should select it."—*Cottage Gard-ner.*

GLASS FOR CONSERVATORIES, GREENHOUSES, DWELLINGS, ETC.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

THOMAS MILLINGTON requests attention to his present prices of SHEET GLASS in 100 feet boxes.

Orchard House Squares on Mr. Rivers's approved plan, to whom I have sold some thousands of feet:—20 inches by 12, 20 by 13, 20 by 14, 20 by 15, 20½ by 12½, 20½ by 13½, 20½ by 14½, at 19*s.* per 100 feet.

200 feet cases at 42*s.*, and 300 feet case 63*s.*, in large sheets.

Boxes charged 1*s.* extra per 100 feet, and the same allowed if returned free of all charge.

HARTLEY'S PATENT ROUGH PLATE GLASS, Fern Shades, Striking Glasses, Milk-pans, Bee Glasses, Cucumber Tubes, Sheet and Rough Plate Glass Tiles, Wasp Traps; Plate, Patent Plate, Crown and Sheet Window Glass, in every thickness and quality, and Ornamental Glass, plain and coloured; pure white Shades for Ornaments, Crystal Glass for Pictures.

Warehouse, 57, Bishopsgate Street Without—same side as Eastern Counties Railway.

THE MOST PERFECT HAY-MAKING MACHINE YET MADE, which has been greatly increased in strength, durability, and lightness, weighing considerably less than other Haymakers, consequently the labour of the horse is much reduced. These qualities have been secured by substituting wrought iron for cast. The Machine is mounted on wrought-iron wheels, and is under the entire control of the person who drives. By merely pressing a spring lever, it is instantly thrown into or out of gear, or the action reversed; and, by a very simple contrivance, the Machine is adjusted to suit every description of crop. Agriculturists should order early, to prevent disappointment.—Address,

RICHMOND AND CHANDLER, IMPLEMENT WORKS,
Salford, Manchester, and 32, South John Street, Liverpool.

MAKE YOUR HAY WHILST THE SUN SHINES.

HAY-MAKING MACHINES & HORSE RAKES, on the most improved and approved principles, are now ready for the approaching season at

RICHMOND, CHANDLER, AND NORTON'S
AGRICULTURAL IMPLEMENT DEPOT, 32, South John St., Liverpool.

N.B.—A Two-roomed Galvanised Iron HOUSE, lined, celled, and floored with Wood, to be SOLD very cheap.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

DUNN'S TAILORS' LABOUR AGENCY invites public attention to the principles on which it is conducted, and by which it offers unusual advantages both to the producer and the consumer, combining high wages to the one with low charges to the other. Conducted by the Agent at small cost, it secures the best labour and pays the best price for it; while it appropriates a part of its trading profits to the moral and social elevation of its operatives, and has provided, at a cost of nearly One Thousand Pounds, Schools for the Education of their Children, Lecture Hall, Library, Warm Baths, &c. See a more lengthened statement in the *Times* of any Wednesday, or send for a Prospectus. A useful Dress Coat, 28*s.*; Wages paid for Making, 10*s.* 6*d.* A first-class Dress Coat, 2*l.* 16*s.*; Wages paid for Making, 15*s.*—Nos. 13 and 14, Newington Causeway, and 39 and 40, Bridge House Place, Opposite. No connection with any other House.

BLAIR'S GOUT AND RHEUMATIC PILLS. Price 1*s.* 1½*d.* and 2*s.* 9*d.* per box.—Mr. William Courtney, Barton, Stacey, Hants, says:—"I had resort to your Pills, and thin two hours I was quite easy. The use of these Pills ought ully to be known all over the world." Among the many coveries, none have conferred such a boon upon suffering nanity as that of Blair's Gout and Rheumatic Pills, they ire neither attention nor confinement, and are certain to rent the disease attacking any vital part. Sold by all icine vendors. Observe that "THOMAS PROUT, 229, Strand on" is impressed upon the Government stamp.

THE GRAPE BLIGHT having re-appeared, Cultivators should apply immediately for its best Preventive and Cure—MADAM'S "COMPOSITION." Packets, sufficient for a large Vinery, with full directions, 3*s.*—Agent, J. HAYNE, 8, Liverpool Street, Bishopsgate, London. Paid orders for two packets forwarded.

DEVONSHIRE CYDER.—A three dozen case (large bottles), of the very best DEVONSHIRE CHAMPAGNE CYDER, will be forwarded to any address on receipt of a Post-office order for 21*s.*, payable to JOHN E. RENDLE, Martin Street, Octagon, Plymouth. Case and bottles, value 9*s.*, included.

GLENFIELD PATENT STARCH, used in her Majesty's Laundry, and WOTHERSPOON'S machine-made CONFECTIONARY, MARMALADE, JAMS, JELLIES, &c., which gained the Prize Medal of 1851, may be had of all Grocers; Wholesale of WOTHERSPOON, MACKAY, & Co., 66, Queen Street, Cheapside, London; and ROBERT WOTHERSPOON & Co., Glasgow.

BRECKNELL'S SKIN SOAP.—Recommended as the best for producing a clear and healthy skin, being the OLD YELLOW SOAP, made expressly for the purpose, of the best materials and not scented. Sold only in Shilling Packets, of either four rounded tablets or eight squares.—Observe each tablet and square is stamped "Brecknell's Skin Soap."

BRECKNELL, TURNER, & SONS, Wax and Tallow Chandlers, Soap and Oil Merchants, &c., to Her Majesty, Beehive, 31, Haymarket.

BERDOE'S VENTILATING WATERPROOF LIGHT OVER-COATS resist any amount of rain, without confining perspiration, the fatal objection to all other waterproofs, air-tight materials being unfit and dangerous for clothing, and being free from vulgar singularity are adapted for general use equally as for rainy weather. Price 45*s.* and 50*s.* A large stock for selection. Also of Capes, Shooting Jackets, Ladies' Mantles, Habits, &c.—W. BERDOE, Tailor, &c., 96, New Bond-street, and 69, Cornhill (only).

HEAL AND SON'S SPRING MATTRESSES.—The most durable Bedding is a well-made SPRING MATTRESS; it retains its elasticity, and will wear longer without repair than any other mattress, and with *one* French Wool and Hair Mattress on, it is a most luxurious Bed. HEAL & SON make them in three varieties. For prices of the different sizes and qualities, apply for HEAL AND SON'S ILLUSTRATED CATALOGUE OF BEDSTEADS and priced LIST OF BEDDING. It contains designs and prices of upwards of 100 Bedsteads, and prices of every description of Bedding, and is sent free by post.

HEAL & SON, 196, Tottenham Court Road, London.

TYLOR AND PACE have removed from 313, Oxford Street, to larger and more commodious premises, 104, New Bond Street, which will enable them to keep a much larger stock in all the different branches of their manufacture, including a very extensive assortment of Iron and Brass Bedsteads, Children's Cots, Portable Bedsteads, and Chair Bedsteads, with suitable Bedding and Mattresses. A Large Show Room is entirely appropriated to the exhibition of Baths and Toilette Ware of every description, all at the most moderate prices. An increased assortment of Venetian and all other Window Blinds, Outside Blinds, and Transparencies. Illustrated Catalogues of Bedsteads, Baths, and Window Blinds, are published separately, and will be forwarded post free on application by naming the description of article required.

TYLOR & PACE, 104, New Bond Street, London.

DR. DE JONGH'S

LIGHT BROWN COD-LIVER OIL, PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY, AND PUT TO THE TEST OF CHEMICAL ANALYSIS, THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, ASTHMA, GOUT, CHRONIC RHEUMATISM, AND ALL SCROFULOUS DISEASES.

Approved of and recommended by Berzelius, Liebig, Woehler, Jonathan Pereira, Fonquier, and numerous other eminent medical men and scientific chemists in Europe.

Specially rewarded with medals by the Governments of Belgium and the Netherlands.

Has almost entirely superseded all other kinds on the Continent, in consequence of its proved superior power and efficacy, effecting a cure much more rapidly.

Contains iodine, phosphate of chalk, volatile acid, and the elements of the bile; in short, all its most active and essential principles, in larger quantities than the pale oils made in England and Newfoundland, deprived mainly of these by their mode of preparation.

A Pamphlet by Dr. de Jongh, with detailed remarks upon its superiority, directions for use, cases in which it has been prescribed with the greatest success, and testimonials, forwarded gratis on application.

The subjoined testimonial of Baron Liebig, Professor of Chemistry at the University of Giessen, is selected from innumerable others from medical and scientific men of the highest distinction:—

"SIR,—I have the honour of addressing you my warmest thanks for your attention in forwarding me your work on the chemical composition and properties, as well as on the medicinal effects, of various kinds of Cod Liver Oil. You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this medicine in its purest and most genuine state must ensure you the gratitude of every one who stands in need of its use.—I have the honour of remaining, with expressions of the highest regard and esteem, yours sincerely,

"Giessen, Oct. 30, 1847. "DR. JUSTUS LIEBIG.

"To Dr. de Jongh, at the Hague."

Sold wholesale and retail, in bottles, labelled with Dr. de Jongh's stamp and signature, by ANSAR, HARFORD, & Co., 77, Strand, Sole Consignees and Agents for the United Kingdom and British Possessions; retail, at their West End Branch, 96, New Bond Street; and by all respectable chemists and vendors of medicine in town and country, at the following prices:—

IMPERIAL MEASURE, half pints, 2*s.* 6*d.*; pints, 4*s.* 9*d.*

WANTED, the Sweepings of a Granary or Barn, as food for chickens.—Apply, stating price, quality, and quantity, to Messrs. COLLIER, Post Office, Thrapstone.

HANTS.

WANTED, a FARM, of about 100 Acres, with comfortable House and suitable Out-buildings, in the neighbourhood of Andover, Winchester, Basingstoke, Alresford, or thereabouts.—Address W. F., 45, George Street, Ryde, Isle of Wight.

OVERTON, HANTS.

TO BE LET, for a Term of Years, COURT FARM, 500 Acres, subject to Tithe Commutation Rent Charge. Near to the celebrated Annual Sheep Fair in Overton, and within a quarter of a mile from a Railway Station to London and the West of England. It consists of Arable, Water Meadow, and Pasture, and is well known as a sound Stock and Corn Farm.—Tenders for the same, stating amount of yearly Rent, to be forwarded to LAMB, BROOKS & Co., Solicitors, Basingstoke, Hants, on or before the 14th day of June next.

TO BE SOLD or LET, on LEASE, a DETACHED COTTAGE and GARDEN, situated in a rural district on the borders of Surrey and Hants. The House has recently been put into repair, and contains five or six Bedrooms, two Sitting-room, Water Closet, Kitchen, &c., and a Walled Garden.—For terms, &c., apply to E. KERMODE, Surveyor and Land Agent, Kingston-on-Thames.

TO GENTLEMEN'S GARDENERS.

VILLAGE INN, WITH 10 ACRES OF LAND.

TO BE LET, a VILLAGE INN, situated near Great Yarmouth, with large Garden and pretty Grounds (2½ acres), besides Arable and Meadow Land, &c. (7½ acres). The House, which a few years ago was a gentleman's residence, is capacious and well arranged, and in excellent repair, with Stables, Coach-house, Sheds, &c. Possession at Michaelmas next. The above is eminently adapted for a gentleman's gardener desirous of retiring from private service, with a small capital. Unexceptionable references required.—Apply to the Rev. T. G. F. HOWES, Belton Rectory, Great Yarmouth, who desires it to be understood that applications which remain unanswered are declined.

TO BE LET, a FLOUR MILL, worked by Steam, driving Five Pair of Stones, newly built, upon the most approved principle of machinery, situate about 20 miles from London, close to a Railway Station, and adjoining a Canal.—Further particulars of Messrs. REE and SON, Estate Agents, Ware, Herts.

COCHIN CHINA POULTRY, ETC.

EGGS FROM PRIZE BIRDS.

MR. JOHN FAIRLIE, of Cheveley Park, Newmarket, in reply to the very urgent applications from numerous amateurs, is now prepared to dispose of a limited number of Eggs, from his celebrated prize Cochins, Brahma Pootras, Scotch Bakies, Dorkings, &c., according to the dates of the orders received.

GOLD-LACED BANTAMS.

TO BE SOLD, a COCK and Two HENS, price 50*s.*; also a COCHIN COCK, price 50*s.*, all last year's birds, and very fine.—Apply to Mr. BAKER, Portchester, Hants.

FANCY PIGEONS.—Jacobins, Fantails, Helmets, Trumpeters, Owls, Tumblers, Nuns, Jackdaws, Pouters, &c., in all colours. The owner, removing from the country to London, will part with the above; they are most beautiful birds; and very tame. Will be sold at one-third of their cost. Most of the old birds have now nests. Particulars will be sent on receipt of a stamped envelope.—F. P., care of Mr. STIMSON, 6, Red Lion Passage, Red Lion Square. Written applications only attended to. Also a very handsome Double Rose Comb White Dorking Cock, 3 years old, and four Coloured Dorking Hens and ditto Cock, in full profit. Can be seen by appointment.

BRAHMA POOTRA EGGS, from the choicest Birds of an Amateur, Brahmas of whose breeding have competed successfully at the first Shows in the Kingdom, viz., the Royal Agricultural, Great Metropolitan, Birmingham, Great Yarmouth, Doncaster, Norwich, Winchester, and Manchester. Price three guineas per dozen, warranted from the best prize and selected birds only.—W. C. G., Post Office, Sandbach, Cheshire.

EGGS FOR SITTING from fine single-combed Speckled Dorkings, weighing 16 lbs. the pair, at 6*s.* per doz. From well-feathered pure White Cochins, 10*s.* per doz., careful package included. Also for sale, a pair of fine Grey Dorking Pullets, 1*l.* the pair. A pair of first-rate White Cochins (cock and hen), 2*l.* per pair. A pair of fine Buff Cochins (cock and hen), 12*s.* per pair; all from 10 to 12 months old.—JOHN G. WRIGHT, St. John Street, Bury St. Edmund's.

BLACK COCHIN EGGS from the best birds in England, having always taken prizes at the best shows, at 18*s.* per dozen, including package. Apply at the city of London Wire Works, 44, Skinner Street, London. N.B. Fowl Houses, Chicken Coops, Poultry Hurdles, and Netting, of every size and description. Illustrated Catalogues forwarded, post free, on application. A few Spanish Pullets, sisters to those sent to her Majesty's yard at Windsor, for Sale.

Sales by Auction.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on FRIDAY, June 2d, at 12 o'clock, a first-rate collection of DAHLIAS, FUCHSIAS, VERBENAS, GERANIUMS, and other plants in bloom, with a large assortment of Plants for bedding.—On view the morning of Sale; Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

ORCHIDS FROM THE BRAZILS.

THE MOST IMPORTANT AND VALUABLE COLLECTION EVER MADE IN THAT COUNTRY.

MR. J. C. STEVENS begs to announce that he is instructed by Mr. de Jonghe, of Brussels, to Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on MONDAY, June 5, at 12 for 1 o'clock, a Consignment of ORCHIDS, received, per last mail-steamer, from his collector in the Brazils, including magnificent specimen plants of Cattleyas Leopoldi, crispa superba, candida, intermedia, and several supposed new species; Burlingtonias, Coryanthes, Epidendrums, Oncidiums, Lælias (probably purpurata), &c., from the provinces of St. Paul and St. Catherine; they have arrived in first-rate condition. Catalogues are preparing, and will be forwarded in due course.

FARNLEY HALL, NEAR OTLEY, YORKSHIRE.

ANNUAL SALE OF SHORT-HORNED BULLS.

MR. STRAFFORD is again favoured with instructions from F. H. Fawkes, Esq., of Farnley Hall, to announce that the Annual Sale of young BULLS from this celebrated Herd will take place on WEDNESDAY, June 7, when their quality will be found such as to maintain the high reputation gained for them at former sales. They combine good size with great substance and excellent quality; their colours are particularly rich and good. The whole were bred by Mr. Fawkes, being descended from the most fashionable blood, and will be sold, as in former sales, without the slightest reserve.—Catalogues, with the pedigrees and other particulars, may be had upon application to Mr. STRAFFORD, 13, Euston Square, London; or of Mr. SCOTT, the Agent, at Farnley Hall, near Otley, Yorkshire.

CHOICE AND VALUABLE COLLECTION OF TULIPS.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—EXHIBITIONS OF PLANTS, FLOWERS, AND FRUIT, WEDNESDAYS, June 21st and July 5th; and of AMERICAN PLANTS, MONDAYS, June 12th and 19th. Tickets of admission can be obtained at the Gardens, by orders from Fellows of the Society, price 5*s.*; or on the days of Exhibition, 7*s.* 6*d.* each.

The Plants will be arranged on a new plan, similar in form to the American Garden, and placed upon a series of Terraces.

The value of the Prize Medals has been raised to above 1560*l.*

BRIGHTON FLORICULTURAL AND HORTICULTURAL SOCIETY.

President.—His Grace the Duke of Devonshire.

Vice-Presidents.

His Grace the Duke of Richmond.
The Most Noble the Marquess of Bristol.
The Right Hon. the Earl of Chichester.
Admiral Sir G. B. Pechell, Bart, M.P.
Lord Alfred Hervey, M.P.
The Hon. A. Macdonald.
Baron de Goldsmid.

General Superintendent of the Exhibition.—Mr. E. Spary.

The ANNUAL SUMMER EXHIBITION OF PLANTS, FLOWERS, and FRUITS, will be held in the ROYAL PAVILION, Brighton, on WEDNESDAY and THURSDAY, the 28th and 29th of June next. Upwards of 200 Guineas are offered as prizes, Schedules of which can be had of the Secretary.

The Band of the Coldstream Guards, by permission of Colonel the Hon. A. Upton, will attend, under the direction of Mr. Godfrey; and the entire suite of rooms, and the eastern lawn, will be thrown open on the occasion.—EDWARD CARPENTER, Sec., Lavender Street, Brighton, to whom all communications are to be made.

CHELTENHAM GREAT EXHIBITION. HORTICULTURAL SECTION.—The days appointed for the British and Foreign Exhibitions are TUESDAY and WEDNESDAY, the 20th and 21st of June, when upwards of 362*l.* will be offered in Prizes. Notice of space required by Exhibitors must be given on or before Tuesday, June 6. *Judges.*—Mr. GORDON, Chiswick: Mr. C. M'INTOSH, Dalkeith Palace; Mr. IVISON, Syon Gardens; Mr. GLENDINNING, Chiswick; Mr. EDWARDS, Wace Cottage, Holloway; Mr. DAVIDSON, Shrubland Park; Mr. KEMP, Rockbier.

THOMAS VOILE, Hon. Sec.
HENRY J. COCHRANE, Sec.

Committee Room, 128, High Street.

EXHIBITION OF AMERICAN PLANTS, ROYAL BOTANIC GARDENS, REGENT'S PARK.

JOHN WATERER begs to announce that his unrivalled Collection of RHODODENDRONS, &c., is now in bloom, and may be viewed by tickets to be obtained of Fellows of the Society. The Plants at the Nursery are also in perfection, and may be seen gratis.

American Nursery, Bagshot, Surrey, near Farnborough Station, South Western Railway.—June 3d, 1854.

EXHIBITION OF AMERICAN PLANTS AT KNAP HILL NURSERY, WOKING.—The American plants at this Nursery are now in bloom, and may be seen daily gratis. The Knap Hill Nursery is within an hour's ride of London, by South Western Railway to Woking, where all trains stop, and from whence capital conveyances may be obtained.—WATERER & GODFREY, late HOSEA WATERER.

NEW VARIEGATED GERANIUMS, ATTRACTION AND SILVER KING.

JOHN AND CHARLES LEE are now sending out strong plants of these elegant novelties, which they can recommend as surpassing anything of the kind hitherto introduced.

ATTRACTION has a decided crimson horse-shoe, on a finely variegated foliage, which greatly enhances its beauty. The flowers are light scarlet. Price 10*s.* 6*d.* each.

SILVER KING is of a dwarf free habit, the leaves perfectly flat, with a very broad silver margin; flowers intense scarlet. Price 7*s.* 6*d.* each, or 70*s.* per dozen.

Nursery and Seed Establishment, Hammersmith, near London.

GERANIUMS.—Large Surplus Stock of Choice Varieties. Any of the following 9*s.* per dozen, or the set of 24 for 16*s.*; strong for immediate flowering.—Alderman, Beauty of Montpelier, Belle of the Village, Centurion, Crusader, Conspicuum, Commissioner, Elegans, Emily, Falstaff, Field Marshal, Generalissimo, Gulielma, Gustavus, Herald, Norah, Magnificent, Nandee, Prince of Orange, Pearl, Rosa, Star, Tyrian Queen, Virgin Queen, Windsor Castle.

FANCY VARIETIES.—Any of the following, 9*s.* per dozen, or the set of 20 for 14*s.*—Beauty of Winchester, Delicata, Electra, Exquisite, Fairy Queen, Jehu Improved, Jenny Lind, Le Belle de Africana, Lady F. Hastings, Maid of Anjou, Magnifica, Mazeppa Superb, Marian, Ne Plus Ultra, Odorata Superba, Prince Albert, Reine de Fleurs, Statiaski, Village Maid, Zelia.

BASS AND BROWN,
Seed and Horticultural Establishment, Sudbury, Suffolk.

JOHN WEEKS AND CO., HORTICULTURAL BUILDERS, King's Road, Chelsea, think it now necessary to inform the Nobility, Gentry, and Public in general, that they have NOT HAD ANY CONNECTION WHATEVER with the Bankrupts Edward and Alfred Weeks, who LATELY carried on business at Chelsea.—June 3, 1854.

ONE THOUSAND POUNDS REWARD.—The Proprietors of a leading Metropolitan Journal OFFER the above REWARD to any person who shall first succeed in INVENTING or DISCOVERING the means of using a CHEAP SUBSTITUTE for the COTTON and LINEN MATERIALS now USED by PAPERMAKERS, subject to the following conditions:—

1. The material must be practically unlimited in quantity, and be capable of being converted into pulp of a quality equal to that which is at present used in manufacturing the best description of newspaper, and at a cost, *cæteris paribus*, not less than 10 per cent. lower.

2. It must be tested, approved, and adopted by three eminent manufacturers of paper (two of them to be named by the Advertiser), whose Certificate shall entitle the inventor to the payment of the reward.

3. This offer will be in force only for a period of 12 months from the 26th of May, 1854.

Apply by letter to A. B., Messrs. Smith & Son's, 136, Strand.

GOOD FREE FLOWERING ORCHIDS.

THOMAS JACKSON AND SON beg to offer the following:—Acineta Barkeri, Acroperа Loddigesi, Cypripedium insigne, Dendrobium chrysanthum, D. Jenkinsi, D. moschatum, D. nobile, D. Pierardi, D. pulchellum, Epidendrum aurantiacum, E. ciliare, Lælia autumnalis, Lycaste cruenta, L. Skinneri, Maxillaria Harrisoni, M. picta, Oncidium altissimum, O. Cebolleti, O. flexuosum, O. leucochilum, O. macroterum, Phaius albus, P. grandifolius, Rodriguezia planifolia, Stanhopea insignis major, S. oculata, S. tigrina major.

T. J. & Son, having a fine Stock of healthy plants of good Orchids suited for amateurs commencing a collection, will be glad to furnish 12 distinct kinds from the above, selected by T. J. & Son, for 42*s.*; 12 selected from the above by the purchaser, 63*s.* Many of the more rare Orchids at equally low prices.

Kingston, near London.

BASS AND BROWN'S NEW POTENTILLAS.—In consequence of the limited stock of King of Crimsons, we regret we must decline receiving more orders. The following are now ready to send out:—

Potentilla Sudbury Gem, each	10*s.* 6*d.*	Potentilla Theodore, each	7*s.* 6*d.*
,, Shylock, do.	10 6	,, Jewess, do.	7 6

The following, 16*s.* the set of seven varieties:—

Floral Beauty	3*s.* 6*d.*	Scarlet Gem	3*s.* 6*d.*
Napoleon	2 0	Primrose	2 0
Defiance	2 0	Argo	2 0
Negress	3 6		

For descriptions and editorial remarks, see *Gardeners' Chronicle* of March 13, p. 144, and April 1, p. 208.

Seed and Horticultural Establishment, Sudbury, Suffolk.

THOMAS WELLAND, Surrey Gardens, Godalming, Surrey, has to offer the following:—True CATTLE DRUMHEADS; also Fine Spring-sown EARLY BATTERSEA PLANTS, packed and delivered at Godalming Station, at 3*s.* 9*d.* per 1000, and sent to order into any county in England, Scotland, Ireland, and Wales.

WELLINGTONIA GIGANTEA.

MESSRS. VEITCH AND SON are now prepared to supply healthy young established Seedling Plants of the above magnificent Tree. For terms, &c., see the Advertisement of their New Plants in another part of this Paper.

Exeter and Chelsea.—June 3, 1854.

LILIUM GIGANTEUM.

JAMES VEITCH, JUN., begs to announce that he has now in bloom a fine specimen of the above noble Lily, which it will be a pleasure to him to show to all lovers of flowers who may be pleased to visit his Nursery.

Exotic Nursery, Chelsea, June 3, 1854.

PLANTS OF CABBAGE, SAVOY, KALE, BROCCOLI, CAULIFLOWER AND CELERY.

JOHN CATTELL, Westerham, Kent, begs respectfully to inform the public that he has a plentiful supply of Plants of his superior true sorts of the above, which will be forwarded to order on receipt of Postage Stamps or Post Office Order made payable here at the following prices, package included:—All the sorts of Early Cabbage, Savoy, and Kale, including Brussels Sprouts, 6*d.* per 100; 4*s.* 6*d.* per 1000. All the sorts of Autumn and Spring Broccoli, and all the sorts of Celery, 8*d.* per 100; 5*s.* 6*d.* per 1000. Cauliflower, Early and Late, 10*d.* per 100. Red Cabbage, 1*s.* per 100; Drumhead, or Cattle Cabbage, 4*s.* per 1000. Packages of 1000 and upwards delivered free of Carriage to London, and to the Edenbridge Station of the South Eastern Rail.

Seed of Cattell's Dwarf Barnes, and of his superior Dwarf Reliance Cabbage, may be had in packets by post for 12 Penny Stamps per packet; the former containing one ounce as usual, and the latter half an ounce.

VANDA CŒRULEA.

MESSRS. MAULE AND SONS having received, the two last seasons, from their collector in the district of the Khasia Hills, a good supply of this most beautiful and charming Orchidaceous Plant, which stands unrivalled amongst the family of Vanda, from its abundant blooming, easy culture, great length of flower spike, and large number of blooms, which are of the most brilliant sky blue, lasting a long time in beauty, flowering from September until January, and in every respect is a first-class Plant of the justly admired tribe of Orchidaceous Plants. There is little doubt that this Plant after cultivation will flower at almost every season, as V. suavis, tricolor, &c. They have also received other esteemed kinds from this of Flora's favoured district of India, which they at the same time offer.

VANDA CŒRULEA	21*s.*, 42*s.*, 63*s.*; a few extra large, 105*s.*
AERIDES affine or roseum	21*s.*, 42*s.*, 63*s.*

The Nurseries, Bristol.

TO AMATEURS, FLORISTS, GARDENERS, ETC.

H. COLES & CO. beg to inform Floriculturists, &c., that their celebrated POT MANURE, which has given general satisfaction for so many years, may be obtained of the following Agents in packages, at 20*s.*, 10*s.*, 5*s.*, 2*s.* 6*d.*, 1*s.*, and 6*d.* each. For Amateur, Rose, Fuchsia, and Chrysanthemum Growers it will be found one of the best Manures yet introduced. Agents:—Mr. G. Lawrence, Seedsman, Piccadilly; Mr. Hooper, Centre Avenue, Covent Garden; Mr. Gaines, Herbalist, Covent Garden; Mr. Wood, Seedsman, High Street, Marylebone; Mr. J. H. Tuck, Florist, Sloane Street, Chelsea; Mr. Rickets, Corn Chandler, Victoria Road, Pimlico; and Mr. Gibbs, 14, Portland Road.—Albert Wharf, 10, Wilton Road, Pimlico.

NEW FANCY PELARGONIUMS.

WM. BARNES, Camden Nursery, Camberwell, begs to announce to his Friends and the Public, that he has purchased the Stock of the following first-rate Fancy Pelargoniums from Mr. W. P. Ayres, and being such as Mr. Ayres has proved to be improvements upon existing varieties, W. B. has much pleasure in recommending them to his friends.

*** The usual discount to the trade.

BOUQUET PARFAIT (Ayres).—A perfect bouquet, of dwarf and very compact habit, and a most profuse bloomer. Colour soft bright rosy lilac, with white centre, and distinct margin of clean white. Height, 12 to 18 inches; size medium; form exquisite. 21*s.*

CRAMOISIE SUPERIEURE (Ayres).—A Cape cross, with deeply laciniated foliage, of a very distinct character. Colour brilliant scarlet crimson of most intense cast; lower petals a little lighter. Habit dwarf and compact; size medium; form very good. A very distinct variety. 15*s.*

DIADEM (Ayres).—A light variety of very desirable quality. Habit dwarf, compact, and of very free growth. Colour, upper petals rich purplish plum, with broad margin of white; lower petals white, slightly pencilled; size large; form excellent. 21*s.*

EUPHROSINE (Ayres).—An improvement upon Beauty of Blackheath, and of free and robust growth. Colour, upper petals, soft rosy crimson margined with white; lower petals white, distinctly spotted with crimson; size medium, form excellent; 21*s.*

KATHLEEN MAVOURNEEN (Ayres).—It is sufficient to say this is an improvement upon Formosissimum (one of the only two fancy Geraniums which ever took a first-class prize as a seedling). Colour, scarlet crimson, slightly pencilled with lilac in the upper petals; lower petals a broad belt of the same colour and distinctly margined with clear white. Size large, form first-rate. An excellent grower. 21*s.*

VICTRIX (Ayres).—This is considered by Mr. Turner and equally competent judges as an improvement upon Celestial, and it has certainly the most perfect lower petal of any Geranium in cultivation, but is a little deficient in the top petals. Colour, soft lilac rose; size, extra large; habit, free and strong; form, nearly perfect. 21*s.*

W. B. would beg to observe that strong plants of the above are now ready for delivery, and most of the kinds may be seen in bloom at his nursery.—Camberwell, June 3.

SEEDLING VERBENAS.

W. J. EPPS has great confidence in recommending the following Seedlings, raised by Mr. Philpot, of Aldington, being without exception the most distinct and splendid flowers in their class yet offered to the public. The following are the opinion and description given by Mr. Neville, editor of the *Gardeners' Record;* they were exhibited at Ashford open Show, in September last, and received first-class certificates.

No. 1. SULTAN.—Dark velvety maroon; large white eye; petals stout; pip, full size; truss, medium; a beautiful variety.

No. 2. BLUE BELL.—Dark velvety blue, with white eye; truss very large and well formed.

No. 4. INDIAN CHIEF.—Crimson puce, very rich in colour; yellow eye; very attractive.

No. 5. DELICATISSIMA.—Pale lavender, with large primrose eye; very beautiful and novel; petals, stout; pips, well formed; truss, medium.

No. 8. RUFUS.—Plum colour purple; velvety texture; dark disc; with a clear white margin; immense flower and trusser.

No. 20. DISTINCTUS.—Cherry lavender grey disc; distinctly margined with dark crimson purple; fine bold truss and large flowers.

The whole of the above are exceedingly free flowering, and excellent habits—well suited for bedding or other purposes; 12*s.* 6*d.* the collection.

SEEDLING PHLOXES.

These are, without exception, the most lovely things in their way possible; they have been much admired by all who have seen them, and have merited the high opinion of the editors of the leading floricultural works. The following is the description from the *Gardeners' and Farmers' Journal*, Sept. 21st, 1853:—

"SEEDLING PHLOXES.—The collection of Seedling Phloxes received is remarkable for novelty and superiority of form.

No. 1. MARIA.—Rose peach, with white eye.
No. 3. ASTROSANGUINEA.—Fine crimson.
No. 4. DISTINCTUS.—Light purple, white eye.
No. 5. CARMINATA.—Deep rose, white eye.
No. 7. SPLENDENS.—Large lilac, white eye.
No. 8. CONSPICUA.—Very deep rose, white eye."

10*s.* 6*d.* the collection.—Nurseries, Maidstone.

ARTHUR HENDERSON AND CO. take the earliest opportunity of informing their friends and the public, that their CATALOGUES No. 3 and No. 6 are now ready and can be had, post free, upon application.

No. 3 contains descriptive lists of Geraniums, Verbenas, Fuchsias, Calceolarias, Cinerarias, Chrysanthemums, &c., amongst which will be found all the best novelties of the season, also the choicest selections from former years.

No. 6 contains descriptive lists of all the newest and best Stove, Greenhouse, and Hardy plants, amongst which will be found many new and desirable plants.

The following new plants are now on sale:

SEEDLING GLOXINIAS.

ELEANOR.—Ground colour pure white, blotched with rose, and shaded with purple.

ELEGANTISSIMA.—Ground colour French white, of great substance, centre pale lavender, spotted with buff.

EUGENIE.—Ground colour rosy pink, centre creamy white, spotted with rose.

EXQUISITE—Ground colour pure white, with broad belt of puce, throat creamy white, spotted with puce.

MAGNET.—Ground colour clear rose, with blotch of purple in the throat, flowers large, of fine form.

PRINCE OF WALES.—Ground colour white, shading off to lavender.

SIR C. NAPIER.—Ground colour deep rosy crimson, throat blotched with intense rose, dwarf habit.

The above seven Gloxinias will all be found to be fine varieties, with large well-formed flowers standing well up above the foliage. 7*s.* 6*d.* each, or 42*s.* the set.

CINERARIA EVA.—Ground colour pure white, with narrow margin of purple, dark disc, fine form and substance; received a Certificate at the National Floricultural Society. 10*s.* 6*d.*

CERANIUMS.

DIADEMATUM REGINA.—Ground colour deep shining rose, upper petals veined with dark purple and white, with blotch of bright orange crimson; very dwarf habit, and abundant bloomer; a fine variety for bedding. 7*s.* 6*d.*

DIADEMATUM SIDONIUM MULTIFLORUM.—Lower petals rosy purple, shaded with crimson; upper petals orange crimson, veined with dark maroon; trusses large, habit dwarf and compact, abundant bloomer; a fine variety for bedding. 10*s.* 6*d.*

PRINCESS.—Ground colour blush white, veined and shaded with carmine, dark horse-shoe foliage, large globular-shaped trusses, and most abundant bloomer. 7*s.* 6*d.*

CETERACH MARANTA (syn. Nothoclena maranta).—A new hardy Fern from the Alps of Switzerland; fronds bipinnate, about 8 inches in length, densely coated with golden brown scales on the under side. 15*s.*

Pine-apple Place, London, June 3.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21*s.*

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gaufred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21*s.*

THE GRAPE BLIGHT.—To bring M'ADAM'S "ANTI-GRAPE BLIGHT COMPOSITION," an effectual preventive and cure for Mildew (see *Gardeners' Chronicle*, May 27), within reach of all Growers, the 1 lb. packet, sufficient for 18 gals. of liquid wash, has been reduced to the standard price of 3*s.* 6*d.*, with printed directions for use. London Agent: JOHN HAYNE, 8, Liverpool Street, Bishopsgate, London. Paid Orders forwarded.

PAGE AND CO.'S COMPOSITION FOR THE DESTRUCTION OF MILDEW UPON VINES, BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, AND STOVE AND GREENHOUSE PLANTS.—Extra strong, 4*s.* per gallon, sufficient to make four (jars and barrels extra); in bottles, 1*s.* 3*d.* and 2*s.* 6*d.* each. 10 gallons and upwards carriage free to London. Directions for use and copies of testimonials upon application. For testimonials see whole page *Gardeners' Chronicle*, March 11, 1854, describing the SATISFACTORY RESULTS derived from its use in cases of Vine Mildew, Thrip, Scale, Green Fly, Red Spider, Mealy Bug, &c., not only without injuring the most delicate flowers or foliage, but promotes a vigorous growth; it is highly appreciated at the Royal Gardens, Osborne Palace, the Royal Gardens, Claremont, and by the principal nobility and gentry in the United Kingdom.

Finest Grasses for Lawns and Parks, and every variety of Garden and Farm Seeds, at B. PAGE & Co.'s, Seed Merchants, Oxford Street, Southampton.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

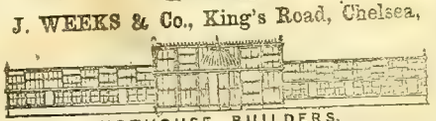
GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER, and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, begs to solicit the attention of the Gentry to his prices for cash. Good substantially built Greenhouses, fixed in any part of the kingdom, 42 feet long, 13 feet wide, 90*l.*; 21 feet by 13 feet, 50*l.*; 12½ feet by 10 feet, 30*l.* A large assortment of Melon and Cucumber boxes, summer houses, &c. Estimates for any branch in the above line either in iron or wood, or park fencing.

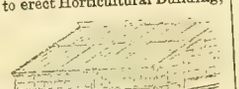
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.



The Nobility and Gentry about to erect Horticultural Building, or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

BY HER MAJESTY'S

ROYAL LETTERS PATENT

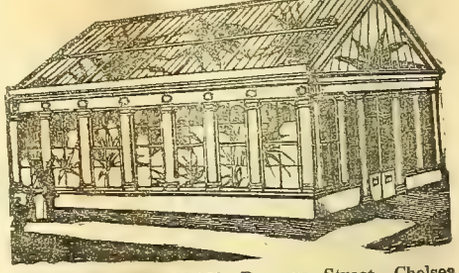
E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

SCYTHES.

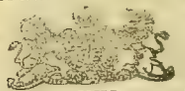
BOYD'S PATENT SELF-ADJUSTING SCYTHE will last out three of the ordinary sort, and is always ready for use.

"We have seen this Scythe at work, and can strongly recommend it."—See *Mark Lane Express*, May 16, 1853.

To be had of every Ironmonger and Nurseryman in the kingdom; and wholesale and retail of WM. DRAY AND CO., Agricultural Implement Makers, Swan Lane, London.

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

IMPROVED MOWING AND ROLLING MACHINE.



ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cliveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom, as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The Machine is made to cut the breadths of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

Further particulars, with prices, may be had on application.

NEW SIPHOCAMPYLUS.

W. J. EPPS has much pleasure in offering the following, feeling they cannot fail to give the highest satisfaction. Strong plants are now ready for delivery.

SIPHOCAMPYLUS NE PLUS ULTRA—Very dwarf habit, with bright green foliage, producing flowers of the most brilliant scarlet in threes and fours at the axle of every leaf; the best of the genus, 10*s.* 6*d.*

BICOLOR ROSEA—Deep crimson, tipped with pale rose, very distinct and beautiful, very dwarf and compact habit; 10*s.* 6*d.* The usual discount to the Trade.—Nurseries, Maidstone.

HONEYSUCKLE VERBENA.—So named for its delightful perfume, which is so near the odour of the Honeysuckle that it cannot be distinguished from it. Last season it was the constant inquiry of visitors at the Nursery Grounds if Honeysuckles were growing near, or what flower so much resembled them in fragrance, and on being informed it was the above new variety of Verbena, they were much surprised, and immediately ordered plants of it.—Description—viz.: Compact habit, fine glossy foliage (will do excellently for bedding, or as a plant for pot culture), long stems to flowers, making it very useful for bouquets—blooms most abundantly; colour rich dark crimson, shaded lilac, very distinct eye; the truss of a fine globular shape, generally measuring 9 inches in circumference, all the pips fully expanded. It will force well during the winter, being a great advantage for cutting, or for its perfume in a greenhouse or conservatory at that season of the year; it will also stand the sun and rain during summer better than any other Verbena. A few blooms added to a bouquet will give it the scent of the sweetest Honeysuckle. Fine strong plants are now ready for sending out, at 5*s.* each.

LOBELIA LINDLEYANA.—The Subscriber having purchased the whole stock of the above new Lobelia of Mr. Keynes, Salisbury, he begs to offer it to the public. It was awarded a Certificate of Merit at the Horticultural Society and National Society of London, June 1853. Description—viz.: Habit, dwarf and compact, flowering very freely, covering the whole surface of the plant; distinct in colour from all others yet out, being a bright rosy lilac. It is an excellent bedding variety, and will be sure to please every one who grows it, especially for its distinct colour and profusion of bloom. Strong plants now ready at 3*s.* 6*d.* each.

The usual allowance to the Trade when three plants of either are ordered. On receipt of a post-office order or penny postage stamps to the amount, the plant or plants will be sent postage and package free.—EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somerset.—June 3.

BEDDING PLANTS.

BASS AND BROWN have a large Stock of the following, VERY STRONG and FINE:—

VERBENAS, in 50 choice varieties, 30*s.* per 100; 3*s.* 6*d.* per doz.
" 20 best new varieties of 1853, 20*s.*
" 10 best new, of 1853, 10*s.*
FUCHSIAS, 32*s.* per 100, in 30 choice varieties; 4*s.* per dozen.
" 15 best new varieties of 1853, 25*s.*
ANAGALLIS GRANDIFLORA, COCCINEA, AND CÆRULEA, 35*s.* per 100; 4*s.* per dozen.
HELIOTROPES, 4*s.* per dozen, or, in 9 fine varieties, 6*s.* per doz.
DWARF ROCK CISTUS, 24 splendid new vars., 15*s.* the collection.
ANTIRRHINUMS, in varieties, very fine and select, 7*s.* 6*d.* p. doz.
PENTSTEMONS, in 6 very fine and select varieties, 7*s.* 6*d.* p. doz.
PHLOX, 50*s.* per 100; 50 choice hardy varieties, 6*s.* to 9*s.* per doz.
" 6 fine new varieties of 1853, 12*s.*
CHRYSANTHEMUMS, 42*s.* per 100; in 100 choice large flowering and Pompone varieties, 5*s.* to 7*s.* 6*d.* per doz.
" 10 best new large flowering varieties, 10*s.*
" 21 best Pompone new varieties, 20*s.*, or 12 for 12*s.*
HERBACEOUS PLANTS, 100 fine and showy varieties, 30*s.*
" 100 varieties, including new, 50*s.*
ROCK PLANTS, 25 fine varieties, 12*s.*
HARDY CLIMBING PLANTS, fine varieties, 12*s.* per dozen.

GERANIUMS.—SEVERAL THOUSANDS OF THE BEST IN CULTIVATION, VERY FINE AND STRONG.

We beg to refer purchasers who wish to make their own Selection to Advertisements in the GARDENERS' CHRONICLE *of March 27th, page* 179; *and April 8th, page* 210, *of these and many other new Plants:—*

18	Best new of last season	66*s.*	0*d.*
12	"	44	0
30	Very choice, of previous date	45	0
12	" "	18	0
	Fine vars., 6*s.* to 12*s.* per dozen.		
6	Best Fancy vars. of last season	18	0
12	Very choice of previous date	18	0
	Fine vars., 9*s.* to 12*s.* per dozen.		

Complete Catalogues free by post for six penny stamps.

Goods Carriage free (not under 20*s.) to all the London Termini and all Stations on the London and Norwich Colchester Line; and Plants added gratis with orders of* 40*s. and upwards.*

Post-office Orders payable to BASS & BROWN, or to STEPHEN BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

NEW AND BEAUTIFUL PLANTS.

MESSRS. VEITCH & SON,

OF EXETER, AND THE EXOTIC NURSERY, CHELSEA,

HAVE much pleasure and confidence in offering the following novelties. Never, perhaps, have they had the opportunity of presenting at one time so many really VALUABLE and STERLING PLANTS as they do on this occasion, long and so liberally been bestowed upon them.

The Plants are well established; and all Orders will be executed in the rotation in which they are received.

WELLINGTONIA GIGANTEA.

Ample description of this noble tree having lately appeared in the *Gardeners' Chronicle*, the *Times*, the *Illustrated London News*, Curtis's *Botanical Magazine*, the *Florist*, and other publications, it is only necessary now to say that it is a perfectly hardy Coniferous tree, of immense dimensions and great beauty.

Fine established seedling plants are now ready to send out on the following terms:—

One plant, 2 guineas		Eight plants, 10 guineas	
Four do., 6	"	Twelve do., 12	"

DESFONTAINIA SPINOSA.

A fine hardy evergreen flowering shrub, with glossy Holly-like foliage, introduced from the Andes of Patagonia by Mr. W. Lobb, *who discovered it in the region of snow.*

It produces beautiful tubular-shaped blossoms, often 2 inches in length, and of a rich scarlet colour tipped with yellow. (See figure in Curtis's Bot. Magazine for May, 1854.)

This plant having been fully exposed in the open ground during the three last winters may, consequently, be declared to *be perfectly hardy.*

It will certainly be a great acquisition.

Fine established plants, in three sizes, 21*s.*, 42*s.*, and 63*s.* each.

One over on three to the trade.

CERATOSTEMA LONGIFLORUM.

(Fig. in Curtis's Bot. Mag. for April, 1854.)

A beautiful dwarf evergreen Greenhouse Shrub, introduced through Mr. W. Lobb, from the Andes of Peru.

It bears bunches of large tubular-shaped flowers, of a rich orange scarlet colour, of a stout waxy texture, and which are of great duration.

It was exhibited at Chiswick in July 1853, and obtained the first prize for new and rare plants.

Good established plants, of two sizes, 21*s.* and 31*s.* 6*d.* each.

One over on three to the trade.

LOMATIA FERRUGINEA.

This fine Evergreen Shrub was found in Chiloe and Patagonia by Mr. W. Lobb.

It attains a height of from 6 to 8 feet, and is remarkable for its beautiful Fern-like foliage.

As a fine leaved Conservatory Plant it is perhaps without a rival, and no collection of fine foliaged plants should be without it.

It has but to be seen to be admired.

Fine established plants of two sizes, 31*s.* 6*d.* and 42*s.* each.

One over on three to the trade.

EUGENIA, OR MYRTUS UGNI.

(Figured in Curtis's "Botanical Magazine" for Jan., 1852.)

This very interesting evergreen flowering shrub was obtained from Patagonia through Mr. W. Lobb.

It has stood several winters in the open ground without shelter, producing its delightfully fragrant flowers in July, succeeded by Strawberry-flavoured berries, eaten in Chili as dessert.

It is a plant of easy culture, and blooming freely in a small state, is well adapted for growing in pots.

Strong blooming plants in 48-sized pots, 21*s.* each.
Second-sized do., in 60-sized pots, 15*s.* each.
One over on three to the trade.

IMPATIENS JERDONIÆ.

This beautiful new Balsam is figured in "The Florist" of January last, and is certainly one of the most interesting of recent introductions.

It is of a dwarf neat habit, of easy cultivation, requiring the temperature of a warm greenhouse or stove, and an abundant bloomer, continuing in flower at least three months.

The flowers are in colour bright red and yellow. It was exhibited in the Hort. Soc. rooms, 21, Regent Street, on the 18th October last, and had the highest prize for new plants awarded.

This is a lovely little plant.

Fine Established Plants ... ... 10*s.* 6*d.* each.
A few extra-sized do. ... ... 21*s.* "

One over on three to the trade.

HEXACENTRIS LUTEA.

A fine Stove Climber, introduced from the Neilgherry Hills, of easy culture, and great beauty.

It produces its flowers in abundance, on elegant pendulous racemes, of from 15 to 18 inches in length, of a clear bright yellow, unmixed with any other colour.

The effect produced when seen drooping from the roof of the conservatory or a trellis is most striking.

It was exhibited at Chiswick on the 13th May last, and obtained the Silver Banksian Medal.

Strong Established Plants ... ... 21*s.* 0*d.* each.
Second sized " ... ... 10*s.* 6*d.* "

One over on three to the Trade.

VERONICA VARIEGATA.

This lovely hybrid Veronica was raised by J. Anderson, Esq., of Maryfield, Edinburgh, between V. Andersoni and V. salicifolia.

In character it is intermediate between the two parents, having a bushy compact habit, and small glossy foliage.

It is an abundant bloomer.

The racemes of flowers on first appearing are a clear bright pink, and gradually shade off to a pure white, producing a very pretty and striking effect.

It is really a most useful and attractive plant.

It was exhibited at Chiswick in July, 1853, and was awarded a Medal and greatly admired.

Fine bushy plants, 10*s.* 6*d.* each. Three for 21*s.*, to the Trade.

AZALEA INDICA.

Striata formosissima (Taylor).

This beautiful new Azalea is now offered for the first time. It is a seedling raised by Mr. Taylor, gardener to J. Coster, Esq., of Streatham. It is a pure white, flaked and spotted with light purple, fine form, good substance, and first-rate habit.

It was exhibited at the National Floricultural Society, on the 16th June, 1853, and received a Certificate of Merit.

It was also exhibited at the June exhibitions of the Royal Botanical Society, Regent's Park, and the Horticultural Society, at Chiswick, on both which occasions it received prizes.

Worked plants are now ready at 21*s.* each. One over on three to the Trade.

MESSRS. VEITCH & SON can also supply the following good and popular Plants:—

Abies bracteata (seedlings)... ...	63*s.*	each.	
Aphelandra Leopoldi	21*s.*	"	
Azalea indica, Beauté de l'Europe	3*s.* 6*d.*	to 21*s.*	each.
Begonia Thwaitsi	10*s.* 6*d.*	"	
Camellia, Countess of Orkney ...	21*s.*	"	
" Storyii	10*s.* 6*d.*	"	
Hoya fraterna	10*s.* 6*d.*	to 21*s.*	each.
Ixora Lobbi	10*s.* 6*d.*	to 21*s.*	"
Lilium giganteum	21*s.*, 42*s.*, 63*s.*		"
Philesia buxifolia	21*s.*	each.	
Rhododendron jasminiflorum ...	21*s.*	to 63*s.*	each.
Rhodoleia Championi	7*s.* 6*d.*	to 21*s.*	"
Streptocarpus biflorus	3*s.* 6*d.*	"	

Detailed Lists are now preparing, and will be forwarded on application.

NURSERIES, EXETER AND CHELSEA.—June 3, 1854.

CINERARIA SEED.

EDWARD GEORGE HENDERSON AND SON, Wellington Nursery, St. John's Wood, London, are now prepared to forward, by post, new Cineraria Seed saved this season. More than usual care has been bestowed in gathering from the choicest named varieties, including the new ones sent out last year; all the light varieties have been discarded, consequently from the above seed we anticipate none but high coloured flowers. Per packet, 2*s.* 6*d.* and 5*s.* each.

Our beautiful collection of CALCEOLARIAS can now be seen in flower at the Nursery, and orders for seed booked, to be sent when ready. Per packet, first quality, 5*s.*; second quality, 2*s.* 6*d.*

The Gardeners' Chronicle.

SATURDAY, JUNE 3, 1854.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, June 6—Linnean ..... 8 P.M.
SATURDAY, — 10—Royal Botanic ..... 3½ P.M.

We are not anxious to give advice to emigrants, although continually solicited to do so. A man's temperament, means, habits, and peculiarities, exercise so great an influence upon his destiny, that it requires a considerable acquaintance with him for even the most sagacious friend to know where in the wide world he is more likely to be successful than at home. It will, therefore, be easily understood why we shrink from the responsibility of saying that which may determine, whether for good or for evil, the future destiny of any correspondent. Nor is it easy to know what value to attach to the reports which reach Europe concerning distant colonies. That statements are very often over-coloured—unintentionally, perhaps—is certain. Nor can it well be otherwise; for if it is natural for a man to eulogise the country in which he has created his fortune, it is equally his interest to say whatever will attract thither the population which will increase the value of his property. And, on the other hand, he who fails assigns his want of success to anything rather than his own unskilfulness, imprudence, or lethargy. The one exaggerates what is good, and overlooks the reverse; the other exaggerates what is evil, and forgets the unquestionable good.

Men of skill and energy will succeed in any colony. To them advice is needless. It is those who have no confidence in themselves, no judgment, no self-reliance, but need to be sustained by continual reference to others who require to be told, if not where they may most certainly succeed, at least where they are least likely to fail.

Without depreciating any other colony, for nearly all have their peculiar advantages, we may safely say that no part of the world now presents such undoubted opportunities of acquiring rapid independence as the BRITISH POSSESSIONS IN N. AMERICA, and more especially CANADA. The natural wealth and colonial industry in the latter country was attested in 1851 by the rich collections which Canadians sent to the Great Exhibition of all Nations, and which placed it above all parts of the Empire except India. And we have now a perfectly trustworthy account of its resources in the statistical and social details lately published by Mr. WM. HUTTON*, a gentleman who is well known in this country, and whose exactness is unquestionable.

It was only the other day, on the occasion of a public dinner given to the Earl of ELGIN, that Lord JOHN RUSSELL, in speaking of the noble Lord, took the opportunity of saying that it had been Lord ELGIN's duty to act the part of a constitutional king over a province which has been continually prospering and increasing under his care; which has risen from little more than a million to two millions of revenue, which has increased in a short time from 600,000 to 1,200,000 population, and the imports and exports of which have shown year by year the symptoms of increasing trade and improving industry. Such a declaration, from such a quarter, was no unmeaning phrase, but the announcement of a great Colonial fact, the knowledge of which cannot be too widely dispersed.

The reply of the noble lord, to whom the destiny of Canada is once more confided, deserves a far more permanent record than the fleeting columns of a daily journal.

"I have had the good fortune," said Lord ELGIN, "within the last two or three months, to be present twice at great banquets held in honour of governors of East Indian presidencies, and attended by many distinguished persons in this country. I confess that when I listened to the glowing pictures of the prospects of India submitted to those audiences, and duly spread over the country through the instrumentality of the press, I could not help feeling something of jealousy and regret that no similar opportunity was given for calling the attention of the people of this country to that great western dependency which, though it is no doubt inferior in wealth and importance to India, and though its condition in many respects even contrasts strikingly with the condition of India, is not inhabited by native

* Canada; its Present Condition, Prospects, and Resources, fully described for the Information of Intending Emigrants STANFORD, Charing Cross. (A Pamphlet.)

tribes, but by a population drawn from the most energetic and active races, Englishmen, Frenchmen, Irishmen, and Scotchmen, and is bordered, not by effete and decayed empires, but by a youthful and vigorous republic, whose distinguished representative has honoured us with his company this evening, and between whose country and the people of Canada generally, give me leave to say that nothing but feelings of mutual respect and gratitude are entertained. (Hear, hear, hear.) Well, gentlemen, your great kindness to me personally has provided such an opportunity, and I believe that very few persons without the walls of this room form any adequate conception of the magnitude of the question with which we are dealing, when we talk of the interests and the future of Canada. (Cheers.) This Canada, of which we speak so glibly, is the great heart of British America, and the greater part of the northern continent of America is still British. True, a large portion of that region is barren and inhospitable, but as to Canada—and I may join with it the sister provinces—it is notorious that it contains a territory capable of sustaining many millions of inhabitants, and is inferior in salubrity, fertility, and everything that can make residence desirable to persons of our race, to no part of the American continent. (Cheers.) And as to its being the more northern part of the continent, I am obliged sometimes to say to our Canadian fellow-subjects, when, with that modesty and diffidence which distinguish them, they vaunt of the great qualities of their southern neighbours, that in England, when we say that a man is too far north for another, we do not mean to say that he is not likely to be his match; and that if the Canadian people only make the most of their great resources and advantages, this proverb will become quite as significant in America as it is in Britain. (Cheers.) This magnificent country, the noble inheritance of the British people, and *which is now brought by the agency of steam within a week's distance of our shores*, is at this moment in a condition of prosperity altogether unexampled, and is affording, to an extent to which its previous history furnishes no parallel, a profitable field for the investment of English capital, and a congenial home for the subjects of her Majesty of all ranks of life. (Cheers.) I can add that a spirit of loyalty and attachment to the Queen pervades all classes of the colonists, whose institutions, as far as circumstances will permit, are now happily a faithful imitation of those of the mother country. (Hear, hear.) The people of Canada, divided as they are into different races and religions, and notwithstanding their party disputes, yet recognise the fact that the common interests which unite them are greater than the causes of division."

It is seldom that a more eloquent description of colonial prosperity has been given; nor was its truth undeserving the brilliant language in which it was conveyed. The cheers of those who surrounded Lord ELGIN, proceeded from eminent personages perfectly conversant with the facts. Had it been otherwise the statements now published by such an authority as Mr. HUTTON, who is the secretary to the Government Board of Statistics in Canada, more than confirm all that was said on the occasion. He is himself, we understand, an instance of the success which may attend the Canadian emigrant: having in 20 years risen to rank and fortune from a very small beginning, he is intimately acquainted with the country, knows its advantages and disadvantages, and indicates the one with the same unreserve as the other.

That Mr. HUTTON's book will be very extensively read we entertain no doubt; without, therefore, attempting to deal with its details, which would be impossible in the space we can afford, we must be contented with selecting a few of the more striking facts. Although 5*s.* to 6*s.* 3*d.* currency are paid per day to harvest-men, yet such is the excellence of the climate that Wheat can be housed for 6*s.* sterling per acre, including all expenses; in fact the sheaves can be carried as soon as they are made up. Hay costs about 2*s.* an acre to cut, averages about 1½ ton per acre, and is worth 35*s.* currency per ton. Timber, as is well known, forms one of the great sources of Canadian wealth; the black Walnut wood of the country is exported to the United States. Land heavily timbered costs for clearing and fencing in about 3*l.* 5*s.* sterling an acre, and is immediately ready for a crop of Wheat. "This cleared land is raised in value to the extent of the cost of clearing and fencing, and will generally sell freely for that sum extra the price of the same land wild. The upset price of the best Government land is 6*s.* 6*d.* sterling per acre; but on the one hand, while excellent land may be had even at 1*s.* 3*d.* to 3*s.* 6*d.* sterling, many lots cannot be had under 30*s.*, and wild land in excellent situations has been known to sell for 2*l.* 10*s.* The taxes on a farm of 250 acres (175 cleared and 75 wild), are *in all* 4*l.* 10*s.*; and in exchange for this trifling impost the Government supplies good roads, good bridges, and excellent free schools. The number of pupils in schools of all kinds, in a population of 950,000, has increased in ten years from 66,000 to about 180,000. Crime is so rare, that on a late occasion in three counties containing 80,000 inhabitants the judge had not a criminal to try.

We cannot pursue this matter further for the present: nor is it necessary, for Mr. HUTTON's pamphlet is so cheap as to be within any one's reach. It will be sufficient to quote what he says respecting the class of men best suited for emigration, among whom, if he does not name gardeners, it is no doubt because he classes them with farmers or labourers.

"Canada is the country, perhaps, above all others where the diligent practical man, no matter to which of these callings (capitalist, farmer, merchant, manufacturer, mechanic, or labourer) he belongs, reaps an ample reward for his industry. Wages of labour, in fact, are so high that none but working men, in the wide sense given to that word, can possibly prosper —mere *overseers* cannot breathe in our atmosphere.

"The chief profit that the farmer makes is by doing his own work by himself and family, and thus not only saving outlay of cash for wages, but earning those wages for himself; thus, for instance, the man who hires another to do his work, say at 5*s.* per day, and remains idle himself, loses the 5*s.* which might have been the reward of his personal industry, and is tempted by that very idleness to spend still more; and his neighbour, perhaps, who performs his own work himself, is 10*s.* richer than he when night comes. It is thus that Canadian farmers, who are a most industrious class, soon accumulate means to pay for their holdings and render them freeholds.

"In the Upper Province there is scarcely such a thing known as a tenant farmer; we are almost all our own landlords, or working our way up to that proud position; not one farmer in 500 pays *rent so called.*"

DISEASE appears to be very common again this year amongst Cucumbers and Melons, assuming rather different forms, but ending equally in the distortion and decay of the fruit, and ultimately, in many cases, in the destruction of the plants themselves. In some instances, indeed, the plants show symptoms of disease from their earliest stage of growth. One of the most serious cases which has yet fallen within our notice has just been communicated from the garden of Lord DELAWARR, in which the greater part of the tissues present a peculiar transparent aspect, accompanied for the most part by chlorosis. Little elevated specks gradually become distinguished from the rest of the tissue, and at length burst; gum is poured out, the superficial tissues die, and the taint is soon communicated to the whole plant. As regards the cause, it is as obscure as ever. The atmospheric conditions of the present year have indeed been very unfavourable for such plants, and might well induce a gouty state, especially where there was a previous tendency to disease, but it is impossible to assert with any degree of certainty that the disease has been produced under such influences. The fact is that where disease has once been generated the taint remains through many generations. It is very generally admitted that as regards the maladies to which the human frame is subject, disease has been greatly modified since the invasion of the influenza of 1837, and the subsequent cholera of 1842; and those whose experience reaches beyond those dates, for the most part readily admit that the treatment of disease has in consequence of this modification undergone great alterations. If this notice be applied to the vegetable world, we may perhaps learn a useful lesson. The most probable method of combatting the malady in question, which appears to admit of little relief when it is once established, will be to fall back upon seed which was produced before its first general invasion, which it is often possible to do, as the seeds of such plants are amongst those which retain their vitality the longest, and it is the practice of many gardeners to retain the seeds of good varieties for years. But if this is to be done with any chance of success, all recent seed must be strictly excluded, for there is no knowing what a powerful influence the slightest cross of a diseased stock may have. The pollen of a Pea will affect the colour of the seeds, even in the first year, so as to make it impossible to recognise the variety from the seed, and in like manner very powerful modifications of the tissue may be affected, even before the hybridising power has given rise to a new form. In the absence of all knowledge as to any other material relief, the hint above given may possibly prove useful, and there are many other cases to which the principle may be applied. *M. J. B.*

THERE is a wonderfully fine set of BRAZILIAN ORCHIDS to be sold by Mr. STEVENS next Monday. Probably thay are the noblest wild specimens that ever reached this country. A Cattleya Leopoldi, a beautiful variety of C. guttata, as fresh as when growing at Parahyba, is 4 feet high and has 26 stems. The condition of many others is of the same kind, and the whole, chiefly consisting of Cattleyas and Lælias, are such as can be obtained by process of cultivation only after years of patient and costly labour.

VEGETABLE PATHOLOGY.—No. XXII.

96. BESIDES the imbibition of moisture from the air and rain, and the perspiration by which superfluous moisture is separated from the plant, the air itself is a most important element in the question, and light is of no less importance as regards the separation of gaseous matter, than that of aqueous vapour from the plants.

97. In animals the great object of respiration is to eliminate the carbon from the system, while in plants, the stability of the matter of which they are built up, and their consequent durability, depend on the fixation of carbon in the system; besides which, carbon enters very largely into all the ternary and quaternary products of vegetation, without which, indeed, the life of the plant would not be supported for one hour. Carbonic acid is partly imbibed by means of the roots, and partly absorbed from the air which enters by the stomata, but probably on a far larger degree from the former cause. Be this, however, as it may, under the influence of light, carbon is deposited in the system and oxygen given out, as may be ascertained by collecting the air so eliminated in a proper receiver. In the absence of light, on the contrary, little or no carbon is fixed, and the surrounding atmosphere is therefore impregnated with carbonic acid. It is not, however, to be supposed that no other component portion of the air penetrates into the plant, only the different gaseous matters enter at different rates of penetration, under different degrees of light, according as the exhaled gases are different. Oxygen, therefore, is inhaled in smaller portions in the day, and carbonic acid in the night, and consequently a room in which many plants are inclosed becomes unwholesome at night, at once by reason of the strong imbibition of oxygen and the exhalation of carbonic acid. Where light has not access, every part becomes bleached and colourless, while the tissues remain tender, and the peculiar secretions greatly diminished, circumstances of which the cultivator takes advantage in the production of many useful and delicious vegetables, which would be uneatable either from toughness of texture or predominance of peculiar flavour, and noxious matters, if grown in circumstances which admitted of the due course of vegetation. The vegetable pathologist has constantly to estimate such circumstances in the production of disease; for such blanched conditions, though answering certain necessary ends to the cultivator, can only be regarded as serious diseases, which, like the "foie gras" of Strasburg, must ultimately end in death. Fungi are a remarkable exception to the general rule, for they absorb oxygen under the influence of light, and give out carbonic acid. The circumstances under which sulphuretted hydrogen is eliminated by Charas have not, as far as we are aware, been at present accurately examined.

98. Air is not, however, the only source of the oxygen, which, combining with carbon, carries carbonic acid into the intimate parts of plants; for a portion, doubtless, arises from the decomposition of water. Neither is pure oxygen the only gas which is exhaled under the influence of light.

99. One of the most striking effects of light on the foliage of plants is the production of their characteristic green colour, which is due to the formation of chlorophyll. Leaves are thus made so many magazines from which, so long as their vitality continues, a supply of nutriment, stored up when their vegetation was most active, is constantly derived at the very time that the intrinsic powers of vegetation, so far as the elaboration of new matter is concerned, begin to fail, or when the exigencies of the ripening fruit are greatest. Starch is more commonly deposited where light is feeble, chlorophyll to a great extent only where it is comparatively strong, and both are equally needful for the supply of proper nutriment.

100. Light is not, however, always capable of promoting the production of chlorophyll. In variegated plants, direct exposure to light will not overcome the natural constitutional tendencies of the plant, nor in seedlings or plants deeply affected with chlorosis is it always capable of restoring health. In some cases, however, as in Wheat crops, where the healthy green tint has been materially impaired by an absence of light combined with cold and moisture, a few bright genial days will effect a complete restoration. There is, however, a limit to its restorative powers, and when the effect has been too long continued, or where there is no staple in the ground, or rather in the sap derived from the ground to work upon, the malady is beyond control, and the consequent fruitfulness of the crop materially impaired.

101. The colour of flowers depends upon the contents of the parenchym of which they are composed, and a species of chlorosis takes place in these modified leaves as certainly as in the leaves of which they are a modification. The different tints assumed by the flowers of some of the Sikkim Rhododendrons, according to the degree in which they are exposed to the light, as visible lately in one of the stoves at Kew, affords a good example. *M. J. B.*

MEDINILLA MAGNIFICA.

The noble foliage and immense drooping racemes of gay-coloured flowers belonging to this plant render it both striking and attractive; and blooming, as it does, in early spring, and very freely, it is well deserving of a place in every collection. It is, however, of a strong robust habit, and requires a warm moist atmosphere to grow it successfully, so that it is hardly suitable for persons of very limited accommodation; but, where it can be afforded sufficient space, it forms a truly magnificent object, and its flowers remain long in perfection.

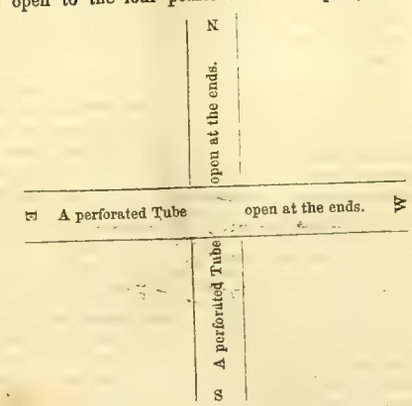
Cuttings selected of rather firm bits of the young wood root freely if planted in sandy peat, afforded a brisk bottom heat, and covered with a bell-glass, to prevent their being injured by excessive evaporation. When fairly rooted they must be potted singly, in small pots, placing them in gentle bottom heat, in a warm moist situation, and shading them from bright sunshine till well established in their pots. But beginners will probably prefer procuring young plants from the nursery to propagating for themselves, and this cannot be done at a more favourable season of the year than the present. Supposing plants to be obtained in this way, on receiving them examine the state of the roots, clearing away all sour or unkind soil, and repotting in convenient sized pots according to the state of the roots, &c. Use good strong fibry peat, carefully broken up, and intermixed with a liberal quantity of sharp silver sand, to ensure perfect drainage. Place the plants in a close, moist, warm temperature, shading them from bright sunshine, and giving water at the roots very carefully until they become well established, but syringe lightly morning and evening, shutting up the house early in the afternoon—and if convenient to afford the plants a gentle bottom-heat during the growing season, this will greatly assist in securing a vigorous root action and rapid growth. If all goes on well the roots will soon be found to have filled the pots, and shifting should be attended to before the growth is checked, regulating the size of the shift by the time that the plants will have for making growth before winter. Use the same compost as recommended above, with the addition of a small portion of sandy turfy loam. It is not desirable to force this plant into a low bushy habit, at least I consider that its large racemes of flowers are seen to more advantage when somewhat elevated, and this is more conveniently done by allowing the plant to assume rather an erect habit, than by keeping it tied out in the form of a dwarf bush, and having to keep the pot on a pedestal while the plant is in bloom. If the plant is kept in vigorous health it will throw out side shoots freely with very little attention to stopping or training. Every care must be exercised to preserve the foliage in perfect health, as upon this the beauty of the specimen largely depends. The matured leaves are liable to be disfigured by black thrips, and green-fly seems to have an especial liking for the buds and young leaves, and will soon do irreparable damage, unless destroyed by the prompt application of tobacco smoke. The plants must be prepared for winter by gradually lessening the amount of moisture in the atmosphere, affording a freer circulation of air, &c., to ripen the young wood. In winter they should be placed in a house where the night temperature may average about 55°, giving water sparingly to the soil, and taking every care to protect the foliage from being injured by damp or insects. To secure large specimens it will doubtless be necessary to afford the plants another season's growth before blooming them, and in this case they may be treated as recommended above, taking care to get the growth completed early in autumn, in order to get the wood well matured before winter, for unless this is attended to there will be little chance of the plants blooming freely. If it is desirable to have a plant in flower early in spring, it must be plunged in bottom-heat, and should not be too freely supplied with water until the flower-buds are perceptible. Keep the plants well supplied with water at the root while in bloom, and shade them from bright sunshine. In this stage they may be removed to a close part of the conservatory, or show house, provided a rather dry atmosphere, and a temperature of from 45° to 55° can be maintained. After blooming, the plants should be removed to a growing temperature, slightly cut back if necessary, repotted, and encouraged to make active growth. *Alpha.*

Home Correspondence.

Effects of the Winter in Westmoreland.—Cryptomeria japonica has suffered slightly, Cupressus funebris has had its leading shoots injured. As regards double red and Warratah Camellias, planted in the shrubbery in the autumn of 1853, without any protection, the double red at this moment is covered with flowers, while the Warratah is looking a little yellow from cold. The double white, planted against a scuth-west wall, is now in full flower without any protection. Scarlet hybrid Rhododendrons without protection are looking well, and are now opening their flowers. Anemones, Auriculas, Polyanthuses, Russian Violets, double and single Wallflowers, are in the height of perfection, covered with flowers. Rhododendrons, Laurels, Kalmias, and all other hardy shrubs, are looking as if there had been no winter on them. Buddlea Lindleyana has been killed; Garrya elliptica, Gaultheria procumbens and Shallon Berberis aquifolium, Pinus insignis, and Cedrus Deodara, are not in the least injured. *H., Windermere, April 7.*

Mildew on Out-door Vines.—It is possible that, in consequence of the singular frost of April 25th, there may be an almost total failure of the Vines, yet, as this is the seventh year since the fruit upon the open walls has to a great extent been destroyed, and the clusters rendered objects of deformity, I have been induced to offer the following suggestions. Sulphur is considered as an effectual—perhaps the only—antidote when used in Vineries or houses under glass. But how can it be employed with any good effect in the open air? That is the question. Three methods present themselves as worthy of notice. The first and most simple consists in syringing the trees with water; and then, while wet, dusting them over every part with sulphur by a flour dredger. But to do this great patience and caution will be required; and, after all, the sulphur might be washed off by the first driving shower. The second method is to prepare a sulphuret of lime by thoroughly blending about eight parts of fresh slaked hot lime with one part of sulphur and a quantity of boiling water sufficient for the quantity of liquid required. When cold and settled a clear yellow solution will be produced, which consists of sulphur dissolved by lime. With this clear solution let the trees be frequently syringed in every part, so soon as the bloom shall be set. If kept only a few days the yellow colour will be lost, and with it the whole efficacy of the fluid. The third, and in my opinion the best plan to be adopted, is to blend in a Wedgwood mortar an ounce or two of sulphur, with a small quantity of powdered gum tragacanth (called gum dragon), adding soft water, drop by drop, till, by triture, a soft and compact paste be obtained, which then can be easily diluted to any extent. The sulphur will, in time, fall as a sediment, but never float on the surface, as it does in the vain attempt to unite it with water alone. A common tin syringe (which costs a mere trifle) is preferable to the more expensive syringe now in vogue. I would recommend well levigated stone brimstone, rather than the lighter flowers of sulphur for the above processes. The sulphuret No. 2 is an excellent and long approved wash for the scale, or turtle coccus of the Pine-apple plant. *J. T., Croydon.*

Aëration.—I beg to furnish a new plan for admitting air into a house or conservatory. Let tubes be perforated (except the ends) and placed along the roof of the building (inside) from east to west, and across from north to south. The mouths of the tubes should be open to the four points of the compass, so as to



admit the air from whatever quarter it may blow, and diffuse it constantly to all parts of the house. The ends of the tubes can have lids to close over during rough or frosty weather. This simple plan I think will be efficient and remove the desideratum (so long complained of) of not having fresh air always, as plants enjoy it out of doors. *A Gardener.*

Hardiness of the Sikkim Rhododendrons.—The condition of a few of these after the 26th April, in a high situation in the neighbourhood of Keswick, may be useful in settling this question. The ten species in this garden are small plants, supplied by Messrs. Standish and Noble in the spring of 1853. Two plants of R. ciliatum had flowered beautifully in March and the beginning of April. R. glaucum was in full bloom, forming a pretty plant hung with its rose coloured bell-like flowers, when the frost of the 26th withered every flower. The leaf-buds of R. fulgens, which were opening, were killed; as were also those of Thompsoni, Wallichi, Wighti, and one plant of niveum; the other, being later, was not injured. Though the leaf-buds of the above have all been killed, the plants are pushing out fresh shoots, and look quite healthy. Falconeri and æruginosum were supposed to have escaped; but, on trying their leaf-buds, they seem all unsound. Edgworthi ought not to have been out, it was in a drooping condition before, and now looks rather hopeless. The flowers of early tender Azaleas have been much injured; one flower of A. amœna has escaped. The flowers of a fine plant of Dielytra were greatly injured. A rose-coloured Moutan stood well, and is now in full flower. Nothing in the garden has suffered equally with the Arbutus. The Oaks, Spanish Chesnuts, and Walnuts all lost their young leaves, so that in this respect the Sikkim Rhododendrons seem on a par with them. *Anon.*——There can be no doubt that reports drawn up in different localities will vary greatly from each other; for some of the species have braved the winter in one of my gardens, and have been much injured or killed in the other, and yet the two gardens are separated from each other by scarcely a mile. But by collecting and comparing the data from different localities, some approximation to a solution of the question can be obtained. As a general rule, those grown in peat have withstood the severity of the winter better than those grown in sandy loam, and, as might be predicted, the growth of those in the peat bed far exceeded those of a similar age in the loam. The R. glaucum was sent in two papers, the seeds of the one being collected at much greater altitude than the other; both have passed the winter unscathed in both nurseries, without any other covering than the snow. This plant appears to vary much in its habit, for some raised from the larger growing plant seem inclined to the habit of the more Alpine variety, and from both are variations in the size and intensity of colour in the flowers, passing from nearly white to pink, and to rose colours of several shades. Some of the flowers are nearly double in size those of others; but however various the leaves may be, they all emit that delicious aromatic perfume that alone would give a warrantry for its cultivation. Not at all inferior in capacity of resisting the cold of our winters is the R. campylocarpum, which has, like the glaucum, stood in both exposures uninjured. The plant is of robust habit, and the flower being of a delicate lemon colour, will cause it to be much cultured. The R. niveum is of similar habit and hardihood, and has equally, in both exposures, proved itself able to resist our variable clime; for the same recent frosts that have killed the young shoots of our Ash and Chestnut plants have done no injury to the growing shoots of any of the three named species. It will be a joy for cultivators to know that R. fulgens, one of the most brilliant of the scarlet kinds, is quite as hardy as the ponticum in peat, but in loam has suffered a little. The spring frost has not injured this kind, for it commences growth later than any of those before mentioned. Of the R. æruginosum I can report equally favourably, for they appear to resemble each other in all the particulars of habit and power of endurance, for the five sorts named had no other covering but snow. The deliciously perfumed R. Edgeworthi appears to shrink from our damp cold atmosphere, and with us positively refuses to be a living habitant of the garden, in either soil or situation. But in a brick pit it thrives well, and will amply repay the grower, as well by the singularity and great departure in leaves and stems from the rest of its family, as for its large and deliciously perfumed blossoms. We may almost prophetically assert that it is destined to be as commonly cultivated as a Gardenia. R. ciliatum has delighted all cultivators, and surprised them too, for, out of the many hundreds that have blown, not one, as far as I am aware of, has opened of the bluish-lilac colour of the plate, which was coloured from freshly gathered specimens in its native wild. All are either pure white or tinted with pale rose-colour on the outer part of the tube, and more especially near the confluence of the nerves or veins which distribute the highly elaborated sap to the delicate texture of the flower. This plant has stood with us in peat, but died in loam. It is, however, a charming pot plant for cold frame culture, flowering as it does most abundantly, and upon plants scarcely 4 inches high. In its foliage it differs from all other known kinds, and we have produced blossoms double the size of that figured in Dr. Hooker's magnificent work. R. cordatum, the Alpine, 14,000 feet, and the fine scarlet, 12,000 feet, have all stood the winter in peat, but can scarcely be said to be alive, certainly not happy in loam. R. Thompsoni, which must be considered the prince of scarlets, has borne the winter satisfactorily in peat, but is quite lost in loam. This species appears often to make a late second growth; in all such cases the last has been killed, but without injuring that first formed. Many of the other kinds, as Falconeri, Hodgsoni, Dalhousiæ, Aucklandii, Maddeni, although I possess, are not in sufficient quantity to warrant the risk; but anthopogon, setosum, and lepidum, have died in the same cold pits that preserved the fine species that are just enumerated. *William Masters, Exotic Nursery, Canterbury.*

Collodion.—I am now in a condition to answer my own question, which appeared at p. 342, respecting spoiled collodion. When I wrote to ask it, I had commenced a process in which I own I had but little confidence; but it has perfectly succeeded. I took the mass out of the bottle in transparent jelly-like lumps, without the least trace of adhesiveness remaining on the fingers when handled. I then drained it carefully for three days, squeezing the lumps afterwards through muslin, and finally drying it by moderate heat, which must be done carefully, as it retains all its combustible and part of its explosive properties. I then redissolved it in pure fresh ether, and it is now as good as ever. A chemical change had certainly taken place, which I regret now I did not sacrifice the collodion to investigate; the ether which drained from it having a peculiar nitrous smell, and at first no tendency to evaporate more than water would have had. But after standing in an open cup before the fire for two days it began to evaporate, and in an hour or two after that it was dry, leaving a lemon-coloured residuum, which exploded on being touched with a red-hot coal. *G. Jeans, Alford Vicarage.*

The Villa Flower Garden.—I am desirous of doing away with the necessity of trusting entirely to my greenhouse to supply the requirements of my flower garden. The present system of "massing plants" is now being introduced into small gardens, I think injudiciously. The nakedness apparent during eight months in every year being one defect—a sameness of colouring arising from the limited number of beds I conceive to

be another. Now, this sameness does not confine itself to the outside of the house, but is observable in the nosegay in the drawing-room. This defect in gardening has arisen, in a measure, from the villa and its occupiers striving to effect the same results as that produced at the mansion. What is grandeur in the one case dwindles into nothingness in the other. I wish one of our writers could be persuaded to put pen to paper, and write a good article on the subject. I have heard the matter discussed among gardeners, and am convinced it would be no waste of time. In the interim, would some one be good enough to furnish a list of good useful plants, of compact habit, to assist me in carrying out the end I have in view, that of having my flower garden look furnished during the greater portion of the year? *Giles Marshall, Whitchurch.*

Effects of the Frost During the Winter of 1853-4, *and Spring of* 1854, *upon certain Plants at Bagshot.*—The effects of the frost upon plants in our nursery, up to the 25th April last, was comparatively trifling. To say, therefore, that any given plant is not hardy, because it was materially injured by that very late and unusually severe frost, would be calculated to mislead, for vegetation, then, was in a very active state. Azaleas were bursting into flower and making young growths; the Apple trees were in full flower, and most of the Abies, many Pines, and the greater part of our ordinary trees and shrubs, were pushing vigorously, the greater part of which were more or less injured. The Oak, the Spanish Chestnuts, and the Walnut, among the latter, suffered severely. In many instances every leaf and shoot were destroyed. All the Azalea flowers that were the least advanced, as well as Rhododendrons in a similar state, were cut off. In fact, almost every kind of plant that had made any progress in vegetation—and there were few that were not tempted to anticipate a too early summer from the succession of warm days that preceded the frost in question—but suffered in some degree. The plants—confining our observations to the rarer kinds—which received the largest amount of injury in the winter with us, are Cupressus Goveniana, C. thurifera elegans, C. funebris, Cryptomeria japonica, and Pinus halepensis; the latter being, in most instances, killed. It is, however, worthy of observation, that well established plants invariably suffered less than others that were transplanted in the previous autumn. But again, specimens of the same genus growing side by side, and under precisely the same apparent circumstances, are in very numerous instances very differently affected; or, rather, some are not affected at all, while their companions are seriously injured. Of these the plants named in the preceding paragraph furnish many examples. As a general rule it will be found that such plants as continue to grow late in the autumn suffer more severely than others that mature their wood comparatively early, all other circumstances being similar. The chances of injury from such causes are, of course, in a great degree under the control of the planter, whose permanent specimens are concerned; for by judiciously selecting situations for such trees, comparative earliness of maturity may be ensured. Appended we give a list of plants, in which is indicated the extent to which they have suffered. Such indications, however, must be taken in a general sense, and not individually, for, as we have before observed, many specimens of the kinds there set down as injured have escaped altogether. In the first part of the lists are named the plants injured by the winter's frost, and which, as will be seen, are comparatively few. The injury sustained by the plants named in the second part must be understood as referring solely to the young spring growths; and, as such, cannot be considered as indicating them to be tender. If so, our common Oak is equally a tender plant; for as a general rule, it suffered much more than the majority of plants named. The Common Silver Fir, too, received in most instances more injury in its young shoots than the other Abies named. I. PLANTS INJURED IN THE WINTER:—Cupressus thurifera, elegans, and Goveniana, branches and leaders killed; many plants wholly uninjured; Cryptomeria japonica, do., do.; Cerasus ilicifolia, nearly killed; Pinus halepensis and Wincesteriana, killed; P. Russelliana, slightly browned; Taxodium sempervirens, leaders and tips of the branches destroyed; Escallonia macrantha, much injured; Myrica californica, foliage slightly injured in a young plant placed out of doors late in the autumn; Podocarpus montana and Quercus sclerophylla, injured; Thuja orientalis, compacta, and aurea, a few branches killed; Laurus regalis, foliage browned. II. The injuries referred to in the following relate solely to the SPRING GROWTHS, or, at least, to injuries sustained from the plants having been excited previous to the very severe frost of the 25th April, when we experienced 10° Fahrenheit. During the winter they were not affected at all:—Abies nobilis, Nordmanniana, and grandis, untouched; A. obovata and orientalis, very slightly injured; archangelica, untouched: this species does not start into growth till very late in the season—a valuable quality; A. (Larix) Griffithi, slightly injured; A. Pinsapo and (Cedrus) atlantica, not touched; A. Cedrus (Cedar of Lebanon), side by side with the preceding, has its young shoots injured; A. Jezöensis, not touched; A. (Larix) species new, from China, with very large leaves, slightly injured; A. Deodara, much injured; A. amabilis, not touched; Abies Webbiana, injured; Berberis Darwini, japonica, Beali, and intermedia, uninjured; Fitz-Roya patagonica, of two plants, one planted out two seasons ago, the other last autumn the former is uninjured, and the latter has lost its leader and the tips of a few of its upper branches; Ilex cornuta, microcarpa, leptacantha, furcata, and Taraga, uninjured; Indigofera, a new species from China, and Juniperus sphærica, uninjured; Lycopodium Willdenovi: this very pretty plant, having been in full leaf, had its foliage destroyed; Lagerstrœmia indica, slightly injured; Laurus regalis, foliage browned; Libocedrus chilensis, untouched; Abelia uniflora, Bletia, sp. from China, Cupressus Corneyana, Chamærops excelsa, Cephalotaxus Fortuni mas, C. Fortuni fem., C. pedunculata, and Pinus monticola, Lambertiana, Ayacahuite, Benthamiana, Lindleyana, insignis; and Montezumæ, uninjured; P. radiata, young growths injured; P. muricata, (?) Californica, Fordi (a species from North-west America), Sabiniana, and Hartwegi, uninjured; Podacarpus Makoyi, nubigena, and Chilina, Quercus glabra and inversa, and Retinospora ericoides, uninjured; Saxe-Gothæa conspicua, injured slightly; S. gracilis, injured; Taxus monstrosa and baccata ericoides, uninjured; Skimmia japonica, uninjured in any way till April 25, when the flowers, with which it was covered, were destroyed; Symplocos japonica, Thuja orientalis, variegata, and intermedia; Trollius Chinensis (new from China), and Viburnum plicatum and macrocephalum, uninjured. Pæonias: All the new Moutans from China have escaped injury, both during winter and spring. Sikkim Rhododendrons: There can now be no doubt that the greater part of these beautiful plants are very hardy. The following list shows how they have been affected with us. A few of them that had commenced growing had their young shoots damaged by the severe frosts in April; but this circumstance does not in reality prove them to be otherwise than hardy, as all we have tried, with the exception of Edgeworthi, which was all but killed, survived the winter perfectly uninjured. Those given in the following list may all be considered as hardy. Those that were injured in April are distinguished by an asterisk. *Foliis cordatis, *Alpine (shrubby), glaucum, ciliatum, calyculatum, Alpine (red), *fulgens, *lanatum, *Wighti, *Wallichi, *æruginosum, dwarf glaucum (very fine scarlet), Falconeri niveum, campylocarpum, cinnabarinum, lepidotum, Thompsoni, setosum, anthopogon, lancifolium, barbatum. We may observe that the injury spoken of is very trifling; all are now making vigorous growths. Of Aucklandi, Campbelli, Maddeni, Hodgsoni, and argenteum, we are not prepared to speak as regards their hardiness, not having planted out any for experiment. *Standish and Noble, Bagshot, May* 22.

Ealing Park.—Many have doubtless lamented the breaking up of the once unrivalled collection of exotics at this place, now spread all over the country; those, however, who imagine that Mrs. Lawrence has given up gardening, a pursuit to which she has devoted so much energy, time, and money, are quite mistaken. It must not be supposed that Ealing Park has no charms beyond its glass structures. Those who have quietly and reflectively traversed these grounds must have arrived at a different conclusion. The park abounds with noble trees, grouped on gently swelling land. The Elms and Cedars of Lebanon are extremely grand. The grounds contiguous to the house are planted with all the newly introduced ornamental trees and shrubs, scores of splendid Deodars, Araucarias, Cryptomerias, &c., are already producing a very magnificent effect. When we consider its contiguity to the metropolis, one of the most striking features of Ealing Park is that as soon as you pass the gates you may fancy yourself 100 miles in the country, so completely do the huge Elms and other massive trees shut out the nearest buildings, and at the same time by no means obscure the Surrey hills, rising in the distance. It has been erroneously reported that this charming suburban residence is shortly to be brought to the hammer; such a thing, I can state, however, on the best authority, has never been thought of; on the contrary, a large amount of land has just been added to it by a recent purchase. There is about as much truth in the report just alluded to as there is in that that Mrs. Lawrence is giving up the culture of plants. Those who may be permitted to view Ealing Park in six weeks' time will see, independently of a number of her best houses retained, a splendid range on the site of the old stoves; and all these houses, when finished, will be filled with one of the most choice and valuable private collections of plants in the vicinity of London. *R. G.*

Ferns.—If your correspondent "Philo-Pteris" desires to grow Ferns in a Ward's case, he must observe the following rules:—He must put some soil into the case; peat and sand are best. He must make the soil damp, which is usually done by adding some water; he must get some Ferns, and having obtained them, he must open the door of the case and put them in, taking care, in the first place, to cover the roots with the soil aforesaid; and in the next place, to shut the door. Having done this, and placed the Ward's case where it is exposed to light, he will have done all that is usually found necessary to induce Ferns to grow. *Nitrogen.*

Sulphur v. *Mildew.*—The articles in your columns on the Vine mildew have attracted much of my attention, as I have a greenhouse with Vines in it, and last season there were unmistakeable signs of the disease, but not to any great extent. Those Vines that were attacked I washed over in the winter with a mixture of sulphur and soft soap, but still the disease made its appearance this season on the leaves, and I dusted them with the sulphur. I was absent a few days, and on my return I found the disease was not only on the leaves but also among the Grapes, and apparently spreading with great rapidity; I thought, therefore, more vigorous measures were required. I recollected that some of your correspondents had recommended the heating the flues very hot, and washing them with sulphur, so as to sublime it. As my greenhouse was full of plants, and I did not wish to apply an intense heat to them, I thought if I put a little sulphur, upon some hot coals it would answer the same purpose; I therefore got two small saucers and put a little live coal in each, and on them sprinkled some sulphur. When I again visited the house I found the leaves of the Vines all drooping, and the next morning it was quite evident that all the leaves were killed. Every plant in the greenhouse, of various kinds, suffered in the same way, with the exception of Camellias; but the flowers were little injured. Neither did it kill the green-fly or scale. I was afraid the Vines would be killed, especially as every shoot and lateral had been stopped, but I am happy to say the Vines are again breaking out, and the Grapes are growing, so far as I can judge, as if nothing had happened. With the growth of the Grapes the mildew proceeds. I am now thinning out the worst of the berries, and dusting the rest. It appears to be only the Black Hamburghs which are attacked; some Muscats and Sweet Waters have scarcely any symptoms of the disease. Why I trouble you with this is, that perhaps you may think it worth while to publish it, as a warning to others who, like myself, may happen to be ignorant of the powerful effects of this remedy, for I do not recollect throughout your volumes a single warning against the danger of applying too strong a dose at once. I may also allude here to the pernicious effects of tobacco fumigation in damaging tender plants, and causing the fall of leaves, &c., when, as I presume, the fumigation is too powerful. *An Amateur, Rotherfield.* [Sublimation is one thing, combustion another. The bad effects of *burning* sulphur are notorious.]

Bees.—These seem to do well this year; out of a little stock of three skeps I have already had three swarms, and parent and offspring stocks are strong and active. The old saw, "A swarm of bees in May is worth a load of hay," though not possible to be realised, yet speaks favourably for our present season in the honey line; and if our boxes and glasses yield product this summer in June and July, we shall covet honey from neither Hymettus nor Hybla. *W. Mason, Necton, Norfolk, May* 31.

Stoppage of Drains by Roots.—It is impossible to over-estimate the importance of determining the conditions under which drains are most likely to be obstructed by roots, whether of trees, root, or corn crops. My own experience tends to show that the chief mischief is when there is a perennial flow through the drains. Some time since I communicated the fact of Mangold Wurzel roots entirely choking a drain for at least 50 yards. This drain was cut through the gault clay to its conjunction with the rubble beds of the upper green-sand, tapping a spring at that point; into this main drain, which was cut directly down the slope, a number of transverse drains are led, cut solely in the gault, and not tapping the spring, consequently only carrying water after heavy rains, and usually quite dry during the period of vegetation; these drains were not stopped by roots. Now that the question has been taken up it should be sifted; it is clear that the depth of the drain is no safeguard. It often happens, as in the case before mentioned, when impervious clays underlie pervious strata, under the slope of hills, &c., that open drains might be cut to carry off the perennial water, and that other drains might be so arranged as to carry the water running at intervals. Under all circumstances, I believe that further investigation will prove that the great mischief by roots is confined to drains carrying perennial water, and that it will be found necessary, as far as may be, to keep such drains distinct from those carrying intermittent water. *J. C. C.*

Slugs, or Snails.—I have been annoyed beyond measure by these pests; but now I have been instructed how to deal with them. Scatter a little oatmeal where they abound an hour or two before dusk, and by making a survey later in the evening, you will find a goodly array of them congregated; this answers best after rain. Last night I made the first trial on a Strawberry bed, and I do not think I over estimate in saying, that in half an hour I captured 5000. I swept them up in lots of from 30 to 50 in the space of a few inches. *R. R. R.*

Grafting in March.—Not till I was about to graft some Pears on Quince Stocks in March did I remember your saying, in the volume for last year, that they will not take unless the stocks are headed down in January. However, as I had cuttings of two sorts which I might not be able to procure next year, I tried a couple of each, selecting those stocks which were most forward in the flow of sap; and it may be worth your knowing that out of the four two have taken, and are in full growth, one of each sort, and the other two are not dead, and may possibly take. *Iota, Alford Vicarage.*

Foreign Correspondence.

THE VINE DISEASE IN PORTUGAL.—This disease having first commenced at Oporto and in the neighbouring gardens, has now appeared in the Alto-Douro, over a country several leagues in extent. The show of fruit is most abundant. The farmers, with the fate of Madeira before them, are waiting anxiously for the arrival of the month of July next, when it must be tested whether the disease is really radical or only atmospheric, and whether this is a second blight, or only the residue of the disease of last year. The greatest

anxiety is also manifested as to whether or not any practical remedy has been found out for the checking the baneful germination of the Oïdium in the vineyards of the Alto-Douro. *Alto-Douro, May* 22.

Societies.

LINNEAN, *May* 24:—ANNIVERSARY. The President in the chair.—The following is the list of office-bearers for the year ensuing:—Professor Bell, Esq., President; W. Yarrell, Esq., Treasurer; J. J. Bennett, Esq., Secretary; *R. C. Alexander, Esq., F. Boott, M.D.; R. Brown, Esq.; *G. B. Buckton, Esq.; *C. J. F. Bunbury, Esq.; W. J. Burchell, D.C.L.; *J. Curtis, Esq.; J. D. Hooker, M.D.; W. Spence, Esq.; *T. Thomson, M.D.; F. Walker, Esq.; R. Wight, M.D., members of Council. Those marked * being newly elected. Since the last anniversary meeting 17 Fellows, six Foreign Members, and two Associates had been elected; and the Society had lost by death the following Fellows, namely, A. Aikin, Esq.; Earl Brownlow; F. T. H. Foster, Esq.; Professor Jameson; G. Newport, Esq.; C. Stokes, Esq.; C. B. Wall, Esq.; N. Wallich, M.D., and also the following Foreign Members:—Dr. Fischer de Waldheim, M. Gaudichaud M. Adr. de Jussieu, Professor Reinwardt, M. Aug. de' St. Hilaire, and Dr. Schwægrichen. The accounts showed a balance in hand of 312*l.* 19*s.* 11*d.*, including a donation from the President of 100 guineas.

Notices of Books.

More Worlds than One, the Creed of the Philosopher, and the Hope of the Christian. By Sir David Brewster. Murray. Fcp. 8vo, pp. 259.

WHETHER the earth is the only one of the heavenly bodies inhabited by intellectual, moral, and religious beings, or whether beings more or less similar to ourselves exist in the sun, moon, and stars, are questions upon which most persons have speculated, and but few, perhaps, have given an answer satisfactory to themselves. Reasoning from analogy can alone form the basis of any opinion not founded on the wildest hypothesis, or on the most arbitrary assumptions. An anonymous author has lately, in an essay called "Of a Plurality of Worlds," endeavoured to show that in all probability the earth alone is inhabited, and in answer to that work, and for the purpose of vindicating the contrary opinion, the present volume from the pen of Sir David Brewster has appeared. The subject is one upon which we confess we have formed no opinion, and must refer those who are anxious to learn what can be said in support of the position, that the inhabitants of this world are not the only intellectual, moral, and religious creatures in the universe, to the fascinating book now before us, merely observing, by the way, in the language of Mr. Mill, that the value of an analogical argument, inferring one resemblance from other resemblances, without any antecedent evidence of a connection between them, depends upon the extent of ascertained resemblance, compared first with the amount of ascertained difference, and next with the extent of the unexplored region of unascertained properties.

Hooker's Icones Plantarum (Pamplin). We see with real regret that this most useful work has terminated with the last half of the tenth volume, now before us. No English publication contains so long a series of uniformly good figures of plants, especially of such as are rarities even among botanists. If the last figures are better than the first, it is only because the art of lithography has much improved since the year 1837, when the Icones were commenced. This, the tenth volume, which contains Ferns only, is sold separately, with a separate title-page and index, forming "a Century of Ferns," which many lovers of this class of plants will gladly place in their libraries. We also recommend it to the attention of artists, for the sake of the beautiful suggestive forms in which it abounds.

New editions have just appeared of *Rivers' Orchard House* and *Rose Amateurs' Guide*, from which it will be seen what interest the public takes in the subjects to which they relate; as well may be the case when the badness of our springs on the one hand, and the beauty of English-grown Roses on the other, come to be considered. Mr. Rivers is enthusiastic in his description of the capabilities of his Orchard-houses, and we have no doubt that he is justified by the result. The new edition contains new and important suggestions for their management—the result of that best of all teachers—continued experience. That we shall end in universally covering large areas with glass roofs, we entertain no doubt, as we suggested years before orchard-houses were thought of. The great obstacle to their employment is their cost; but it seems coming to this, that we must either have complete spring shelter for fruit trees, or we must give up growing them. The Rose Guide also contains new matter, but we must refer to that on a future occasion.

New Plants.

65. GOMPHRÈNA COCCINEA. *Decaisne in Rev. Hort.* 1854, *p.* 161, *fig.* 9.

The pretty Amaranth known by this name is quite a new acquisition to our gardens. M. Vilmorin was the first to offer it for sale in 1853. The seeds were sent from Mexico, and named Gomphrena Hoveyana (var. superba), and G. Haageana, for which was substituted, in the last edition of the "Bon Jardinier," the name of G. coccinea, which recalls at once its most striking feature, viz., the brilliant orange colour of its flower heads. Although somewhat like G. globosa, the present plant may be known by the form of its flowers, which at once distinguishes it from certain varieties of globosa, with similarly coloured capitula.

G. coccinea is an annual herbaceous plant, about half a yard high, and a little stronger than G. globosa. Its branches are cylindrical, slightly hairy, pale green, and look as if speckled with white; the leaves are so too, and are opposite, oblong, or linear-lanceolate, pointed at the apex, and vanishing at their lower end into a short petiole; they are, moreover, from 0.07m. to 0.08m. long, and 0.08m. to 0.015m. broad. The capitula are terminal, solitary, oval, about the size of a pigeon's egg, and are composed of small flowers regularly imbricated. The peduncles are long, and quite at the top carry two or three large bracts, differing but little from true leaves, and forming a sort of involucre spread out below the inflorescence. The flowers are small, insignificant when looked at separately, and are besides almost entirely hidden by three scarious-pointed oval bracts, which surround each of them. Of these bracts the lower, one-half as short as the other two, is flat, and nearly colourless; the lateral ones, on the contrary, are concave, keeled, ciliated externally on the medial nerve, and of a brilliant orange red colour—they constitute the ornamental part of the plant. The flowers are composed of a calyx, with five pointed divisions, having but little colour, except, perhaps, at their apex, and of a staminal tube with 10 teeth or divisions, below which are, inside the tube, five sessile, elongated, unilocular anthers. At the bottom of the same tube is a single-seeded ovary, surmounted by a style and a bifid stigma.

As regards cultivation, G. coccinea is like a Cock's-comb. Although the native of a tropical country, its annual character places it amongst the plants which can be grown in the open air in the climate of Paris, but it requires a hot place, and to be sheltered from cold during the early stages of its growth. The seeds should be sown in March, in a hotbed, and afterwards placed out in beds, or pots sunk in the bed, and carefully covered up from the least cold. The flowers appear early or late, from June to November, according to the time of sowing. *Decaisne.*

Garden Memoranda.

HORTICULTURAL SOCIETY'S GARDEN, TURNHAM GREEN.—By the time this notice shall have been published, the bustle and activity connected with the Society's second great exhibition of fruits and flowers, fixed for this day, will have commenced; and it is gratifying to be able to state that, notwithstanding the severity of the late spring frosts, which made such havoc everywhere, the garden will be in excellent order to receive the gay throng that may be expected to occupy it on the occasion. The late rains have refreshed vegetation wonderfully, and, owing to its now undulated surface, the turf of the arboretum is delightfully soft, without being too damp, and beautifully green. Many of the ornamental trees, such as Chestnuts, Pyruses, &c., are also now in full bloom, and Azaleas and Rhododendrons, both in the American garden and elsewhere, promise to be very nearly, if not quite, at their best; even in front of the orchestra, those in the clump which has lately been so much altered, will be sufficiently forward to be as effective as shrubs so recently transplanted can possibly be expected to be; so that both in and out of the tents, we need not say, the scene cannot fail to be one of great brilliancy and gaiety.

Notwithstanding the general unscathed appearance of the garden, however, here and there the ill effects of last winter are unmistakeably apparent. Some of the Pinuses more especially have been very much cut up. Among the worst are P. Devoniana, Russelliana, and patula; these have been all but killed, and have been obliged to be pruned back till scarcely any foliage remains on them. P. Lindleyana has stood well, the ends of a few of its long leaves on the north-east side only having been browned. P. leiophylla has been cut down; but is pushing again from the bottom, as is also a plant of P. Hartwegi. P. Ayacahuite and Teocote have wintered safely; P. apulcensis has been greatly cut up; and P. macrophylla has had the ends of its long leaves browned. P. pinsapo is uninjured; P. radiata has had the points of its leaves browned a little; P. muricata and monticola are uninjured, as are also Nordmanniana, Montezumæ, and Fremontiana. Pinus Orizabæ has been killed down to the ground; as has been Abies Brunoniana. Abies orientalis and Pinus tuberculata are untouched. The Mount Atlas Cedar is also unhurt. Deodars have been browned by the spring frost, and, in some cases, lost their young shoots. Fitz-Roya has wintered well; but Saxe-Gothæa has been killed. Cupressus funebris has sustained very little damage, and C. Uhdeana is everywhere unhurt, as is macrophylla and Goveniana. The Mexican Juniper has likewise stood well, as have Cryptomeria Lobbi and japonica.

Ceanothus dentatus and papillosus, in a somewhat sheltered corner, are now in full bloom, and have stood the winter unscathed, as have also C. rigidus, integerrimus and verrucosus. A bad variety of Indigofera decora has likewise stood unhurt. The Van Diemen's Land Swammerdamia antennaria, a fine bush in the open garden, is now in full flower; it has only had one or two of its branches injured by frost. Catalpa Bungeana has had its unripe points cut back, but it is pushing afresh; Weigela rosea is in full bloom, and is perfectly free from injury, as are also various Moutans, which are now coming into flower. Elæagnus parvifolius is in full blossom and unhurt, as are also the Russian Pyracanth and Ribes speciosum, whose red Fuchsia-like flowers are very handsome. The Chusan Palm has also wintered safely; Syringa emodi has been very much hurt; Pavia indica has been injured by spring frosts, but P. californica has escaped. Acer caudatum has had its young shoots very much cut up by the late spring frosts.

As has already been stated, the Rhododendrons in the American garden are coming finely into flower, and the rockwork at its entrance is now gay with large patches of the white Iberis gibraltarica, Dianthus suavis, Woodruff, Cerastium grandiflorum, &c., intermixed with Ferns. On the banks we remarked Orchis speciosus in flower. Taxodium sempervirens, a good specimen of which stands among the Rhododendrons, has wintered safely, but some of the branches near its top have been injured by the frost of the 24th of April. It may be worthy of mention that a small plant of Assam Tea stood this frost (14°) unhurt. It is growing on a point of rockwork near the west entrance to the great conservatory.

The frost just alluded to did considerable damage in Mr. Ewing's glass wall, both to plants and fruit trees; a Peach tree in it, which was loaded with blossoms, having lost them all, and several other things having also been injured. Abelia triflora, though hurt a little, has stood in it tolerably well. New Holland Metrosideros lanceolatus has succeeded perfectly. Viburnum suspensum, Lindleya mespiloides, Edwardsia chilensis, and Tea Roses, also do well in it; while the young wood of Fuchsias, which were some 18 inches high, has been killed down to the root by the spring frost in question.

Some experiments as to the advantage, or otherwise, of using collodion for striking cuttings have been made in the propagating house. Of a potful of cuttings of Luculia gratissima, one half of which had been treated with collodion, the half so treated has begun to push, while the others which had nothing done to them, as yet show no symptoms of moving. Abelia uniflora, put in in a similar manner, showed the good effects of the collodion, even in a more remarkable degree. It is reported, however, that it does not suit plants having a milky juice, or soft-wooded things, which throw out roots from their stems—a cutting of Gesnera ulmifolia, coated with collodion, as far as it was inserted in the soil, having refused to root except at the surface of the mould, and above where the collodion had been applied; but for hard-wooded plants that callus and root in that way, it has been found to be invaluable, promoting the formation of roots very greatly.

Some of the young Pear trees in pots in the orchard-house, which was formerly a Rose-house, are bearing fruit, and all other kinds of trees in it are thriving satisfactorily. Some Strawberry plants, too, lifted out of the open border this spring, potted and placed there, are flowering abundantly and bearing good fruit.

Out of doors the first blooms of Strawberries have been killed, but there are still enough left for a crop. Pears, Apples, Plums, and Cherries, both on walls and standards, have suffered so much from the frost of the 24th of April as to be a failure. Of Pears, the only sorts that promise to yield anything like a crop are, Duchesse d'Angoulême and Forelle or Trout Pear, both against walls. Of Peaches and Nectarines there will be a crop, though not so heavy as it otherwise would have been.

FLORICULTURE.

THE FUCHSIA.—Now, that we have got in our best varieties of this flower all the properties it may be expected to be made to possess, it behoves us to exert ourselves to grow specimens in the shortest possible time, worthy of the fine blooms which many of the kinds produce. If pyramidal plants are wanted (and if they are not grown in this way their beauties are not seen to advantage), cuttings should be taken from the short-jointed wood of the present year's growth, but not in too tender a state; for when the wood is too soft they are apt to shrivel and damp off. Use 4-inch pots well drained; then fill up with a compost of leaf-soil and sand, pressing firmly and surfacing with silver sand; then plant the cuttings all round the sides of the pot. Water gently with a fine watering-pot, and finish by plunging the pots in a mild moist bottom-heat in the propagating pit or frame, where they will soon emit fine young rootlets. Shade on warm sunny days to prevent their drooping and getting scorched. When they can stand handling with safety, pot singly in 3-inch pots into a lightish compost of loam, leaf-soil, and a little sand to keep it open. Plunge again for a few days where they were before, which will assist them in taking hold of the new soil. Then remove them to a warm pit or Vinery, where the temperature will range between 60° at night and 70° by day; the atmosphere should be kept moist, so as to induce them to make short-jointed wood. When the pots are full of roots, give a shift into a 6-inch pot, using a rather rich compost of nearly two-thirds strong fibry loam, and one-third of old cow droppings, leaf-soil, and sand, mixing all the parts well, so as to thoroughly incorporate them. Care must be taken to secure good open drainage by placing a large potsherd

over the hole in the pot, with smaller pieces over that and around it, and a little Moss over all to keep it from getting choked up. The plants will now be pushing vigorously, and laterals will be breaking forth freely. The main stem must now be tied to a neat stick, to keep it upright. When the laterals have grown a little past their first joint pinch them back to it; they will now push a couple of fresh shoots. Let this pinching be confined to the four lower tiers of laterals, the rest may be allowed to grow. The plants may now get a slight mulching of sheep dung, and be permitted to come into bloom, when they should be removed to the front table in the plant house, where they will flower freely for some time. It will now be December, therefore they should be allowed a season of rest, say in a cold pit, after they have been permitted to ripen their wood. They should be protected from frost, and should receive little water until the middle or end of February, when they may get a more liberal supply. They may be taken to a warm pit or Vinery in March, where they will soon show indications of rapid growth. After they have made a start they should be turned out of their pots and their roots examined, re-potting into 10-inch pots, in which they should be flowered. For soil, use strong rich fibry loam, with about a third of well decomposed cow droppings, and a little leaf-soil and sand to keep the soil porous. They should be pruned back to the last joint, from which they will push two strong shoots, and if kept pinched, as directed for last season, they will soon form handsome plants. Secure a good leader now, as they will be growing rapidly. By the middle of April a mulching of sheep dung will be found beneficial; but this should be used so as not to look unseemly. The bottom branches should be permitted to attain the length of a couple of joints before pinching, so as to get a good broad basis. After the laterals have broken out again, they should then be pinched back, stopping regularly as the plant grows, so as to secure a well formed specimen. They should not be stopped after the second week in June, and by the latter end of that month they should be set in a conspicuous place in the greenhouse or conservatory, where, by the middle of July, they will be coming into fine bloom, and will continue in that condition until October, provided a shade be applied on hot sunny days, which also preserves the colour. Bees are often very destructive to the flowers, and should therefore be excluded. When their beauty is nearly exhausted they should be removed to a cold pit, to afford room for the winter inmates of the house. The same treatment during this winter as was recommended for last, will be all they will require till spring, when they may be pruned and started according to the time they are required to be in bloom. They should be re-potted, as last season, in 10-inch pots, for which the roots should be cut back, so as to admit plenty of fresh soil. The middle of March will be found a very good season for propagating Fuchsias. A few oldish plants should be started early in the season for this purpose. Cuttings struck at this period will enable you to get nice little plants the same season for specimens the following year. *W. F.*

POLYANTHUS: *E S.* You should inquire for Addis's Kingfisher, a bold, finely formed, and rich red kind. We should be glad to see flowers of this style more patronised, as they contrast so well with the darker varieties.

SEEDLINGS.

PELARGONIUMS: *Pectis.* A clean looking flower, but a little deficient in shape.

CACTI: *P G.* Both very handsome; but of the two, No. 1 is the best, on account of the fine violet tinge which it possesses.

Miscellaneous.

Autumn Planting of Potatoes.—Although it is pretty generally acknowledged that autumn planting is the best means of preserving the Potato from the disease, still another example of the good effects of this method may prove useful. I will therefore describe my mode of proceeding in as few words as possible. In May the ground intended to receive the Potatoes is manured; after the manure has been dug in, French Beans are planted, the crop from which pays the expense of the first digging. In September the French Beans are removed, and the ground is again dug deeply. It is then allowed to remain in that state till the end of October. At this period it is laid out in beds 3 feet 3 inches wide, and in these beds holes 10 inches deep and 2 feet apart are made with the spade. After the sets have been deposited in the holes, the latter are filled up two-thirds of their depth with well decomposed vegetable mould; the other third is filled in with earth from the field. On the first appearance of frost in November the ground is covered with a layer of long dung about 6 inches in thickness and the whole is left undisturbed till March. At this period the dung is removed and the ground stirred. When the Potatoes come up they are treated in the usual way, with this difference, that in June, after they have flowered, all the stems are cut off as close to the ground as possible. The whole of the haulm is removed to a distance from the field, in order that the tubers may not be affected by the diseased leaves. This method has been employed for several years, and it is worthy of remark that the Potatoes thus grown are almost entirely free from disease, whilst those from which the leaves had not been removed were much diseased, even though grown in the same ground as the others. Lastly, there is another advantage in autumn planting, namely, that of the crop being earlier than by the usual method, and this is a point which no cultivator should neglect. *Chardon Régnier, in Rev. Hort.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Many of the New Holland plants and other greenhouse subjects will soon be getting past their best, and some foresight and care will be necessary to avoid being short of specimens in bloom with which to supply their places. If former directions have been attended to, many things in the stove (as Allamandas, Clerodendrons, Croweas, Achimenes, Gloxinias, &c.) should now be in a forward state; but these must be carefully prepared for removal to the cooler and drier atmosphere of the conservatory, otherwise there will be great risk of injuring the foliage, &c. Where circumstances will admit, plants that have been grown in a warm moist atmosphere should be removed to an intermediate house about a fortnight previous to their being taken to the conservatory, and gradually inured to a free circulation of air, &c. By attention to this, and placing the plants in the warmest corners in the conservatory, the Clerodendrons, Allamandas, Achimenes, &c., will continue growing slowly and blooming for some three months; whereas, if this is neglected, their beauty may be very short-lived. Aim at maintaining an even temperature in the conservatory, after removing thence plants that have been grown in the stove, and avoid allowing the atmosphere to become very dry on bright warm days. Also see that every plant is perfectly clean before placing it in this house, and that the creepers, &c., are not infested with insects. Go over the house every morning, and remove decaying flowers and leaves as they make their appearance. Until we experience more settled weather, valuable specimens of greenhouse plants should not be placed out of doors, unless where it cannot be avoided; and everything in a growing state should be shaded from the forenoon's sun for some weeks after removal to the open air. Young stock in pits and frames will now be making rapid growth, and must be carefully attended to as to watering, stopping, and training, &c. Examine Heaths frequently for mildew, and apply sulphur the moment it is perceived, some of the soft-foliaged varieties being very liable to be attacked by this pest at this season. The best preventive is keeping the plants in vigorous health, and affording them a free circulation of air. Attend to supplying healthy vigorous plants with pot room as they may require it, and avoid allowing them to sustain any check at this season.

FORCING DEPARTMENT.

PINERY.—Where the quality of the fruit is of first importance, care must be observed to have the soil in a healthy rather dry state, during the period of ripening; for there is no reasonable hope of obtaining high-flavoured fruit from plants growing in wet sour soil. And in the case of plants growing in pots, the trouble necessary to collect and place together those approaching ripeness, so as to be able to afford them a rather dry atmosphere, and avoid touching them with the syringe after they begin to colour, will be well repaid. Suckers that are not very strong will be benefited by being left on the stool for a month after the fruit is cut; but this will seldom be necessary in the case of healthy vigorous plants. Any neglect in the way of watering and maintaining a moist atmosphere in the case of succession stock may lead to their fruiting prematurely; therefore, let there be no lack of attention at present. Plants swelling their fruit should be encouraged with plenty of liquid manure, and a moist high temperature, shutting up early in the afternoon after syringing. VINES.—If spider makes its appearance on the foliage after the fruit has commenced colouring, no time should be lost in coating the hot-water pipes with sulphur. The sulphur should be mixed in water, with about equal quantities of lime and soot, and applied with a brush. The lime serves to prevent the sulphur being washed or rubbed off, and the soot helps to prevent the disagreeable appearance. The temperature of late houses, where the fruit is now showing, must not be allowed to fall too low at night, if good sized bunches are expected; and where Muscats are grown for a late crop, there will be but little chance of securing a good crop of these, unless a temperature of 70° is maintained. Attend carefully to young Vines recently planted, keeping the border in a healthy, moist, state; maintaining a moist atmosphere, and shading, if necessary, until the Vines get a fair start. Proceed diligently with thinning the berries, &c., immediately they are ready, for they progress rapidly at this season; also stop all laterals in time, and allow no confusion. MELONS.—Where the fruit is swelling, the soil should be kept in a properly moist state, and every means should be used to preserve the foliage in perfect health, as there is no possibility of obtaining good flavoured fruit unless the foliage is kept in health. Keep the Vines thin, and prevent their being encumbered with useless laterals, and remove any decaying leaves at once, as these, when left, only serve as a harbour for insects. There is yet plenty of time to secure a good crop in dung beds, and if any of the frames which have been used for getting up "bedding-out stuff" can be spared for this purpose, the plants should be got out at once. Very little artificial heat will be necessary at present, but the bed should be made sufficiently high to allow of being able to apply a lining if necessary towards August. This will be best managed by making the bed some 2 feet high with any useless material which will not ferment, placing on this some 18 inches of well fermented stable manure, which will afford sufficient heat for the present.

FLOWER GARDEN AND SHRUBBERIES.

Examine recently transplanted trees and shrubs, &c., frequently, to see that they are not suffering for the want of water. Give a liberal soaking when necessary, and stir and mulch the surface afterwards. The half hardy plants now consigned to their summer places after many months' shelter under glass, and much attention and care, must be duly attended to with water until they lay hold of the soil; and, with the present favourable weather, and proper attention, they will speedily cover the beds, and well repay all the trouble and attention that have been bestowed upon them; but every effort must be used to prevent their sustaining any check, for, if allowed to get into an unhealthy state at present, there will be much difficulty in getting them into free growth without much loss of time. Spare hand-glasses should now be used for the propagation of favourite spring blooming plants, as Pansies, Phloxes, &c. These do best on a shady border.

HARDY FRUIT AND KITCHEN GARDEN DEPARTMENT.

The Strawberry beds will now require attention as to watering, &c. After thoroughly cleaning the beds, a thorough soaking should be given the first possible opportunity, and if a moderate watering from the stable tank can be given when the ground has been well saturated with clear water, it will greatly assist in securing large fruit. The beds should be mulched as soon after watering as convenient, in order to prevent evaporation, and the fruit from being soiled. Next to slates or tiles clean straw is the best material for this purpose, and mowings of lawns the worst. The latter, besides forming an excellent harbour for slugs, soils the fruit, spoils its flavour, and in wet seasons hastens the decay of any over ripe fruit. Where clean straw cannot be afforded, the fresh litter from the stable-yard will form a very good substitute. Exposure to the air and a few showers will perfectly sweeten this, so that there need be no fears entertained of its injuring the flavour; but it should be applied immediately. Persevere in the destruction of insects on fruit trees as soon as they are perceived. Hoe and thin such crops as require it, and encourage the growth of Cauliflowers, &c., by frequent waterings with manure-water.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending June 1, 1854, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 7th 1846—therm. 90 deg.; and the lowest on the 8th, 1838—therm. 35 deg.

Notices to Correspondents.

DISEASES: *W Hamilton.* Your Apple leaves are covered with the common *Oidium leucoconium*, a mould very frequently destructive to young Hawthorn, and which may affect the health of your trees. The insects have nothing to do with the affection. Syringe your trees well with the solution of sulphur and lime, the receipt for which you will find in the *Gardeners' Chronicle* of last year, and we doubt not that your pains, if continued, will be rewarded by the disappearance of the parasite. The same observation will apply to Peach mildew.—*C B.* Nothing is more common than for Strawberry leaves to be affected with spots, the cause of which is somewhat obscure. They do not, however, seem in general to suffer materially from the attack. The spots on your leaves do not seem to be quite like the ordinary spots, and are probably due to the action of drops of water on the leaves. This action is sometimes chemical, sometimes physical. Your note is too short to indicate either the circumstances under which the plants were placed or the condition of the plants themselves. If the general health is not affected, the local malady may safely be considered as unimportant. *M. J. B.—L C K.* The cause of your double yellow Rose buds rotting off in the way they have done is doubtless cold and damp. Specimens in a similar condition have reached us from other localities.‡

EVERGREENS: *L C K.* September, as we have often stated, is the best month for transplanting all kinds of evergreens.‡

INSECTS: *Spes Ultra.* The larvæ of the common cockchaffer, which you have found so destructive to Lettuces in ground recently meadow land, can only be captured by well turning up the soil and picking out the grubs. You may, however, bury vegetables in the ground as decoys, and take them up once a week, but this will be very partial. Take care to kill all the perfect insects when they appear. *W.*

NAMES OF PLANTS: *T.* Salix pentandra, the Sweet Willow.—*R L.* Cytisus purpureus, Caragana Chamlagu.

STRAWBERRIES: *N B.* The same plants may be forced two years in succession, but as a general rule it is better to use young plants every year.‡

THE HORSE CHESNUT: *A R J.* This is so called in consequence of the seeds being ground and mixed with horse-food in Turkey; especially, it is said, when horses are broken-winded. Deer are fond of them. The scars on the branches have, like the scars of other plants, the form which is presented by the end of the leaf-stalk. The horseshoe form is extremely common; more common, perhaps, than any other.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.
WM. INGLIS CARNE, 10, Mark Lane, London.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only: and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London: and from all the other Agents of the Company.

GUANO (PERUVIAN) AND CHEMICAL FERTILISERS.—NITRATE OF SODA; PERUVIAN GUANO; SUPERPHOSPHATE OF LIME; AGRICULTURAL SALT; AND CONCENTRATED MANURE FOR TURNIPS.
The above articles are supplied on the lowest Cash Terms, for best qualities only, on application to Mr. JOHN CLARANCE, Agriculturist's London Agent, 1A, Bishopsgate Street Within.

TURNIP SOWING.
SUPERPHOSPHATE OF LIME, made from Bone, which is the best Manure for Root Crops (see the Royal Agricultural Society's Journal, Vol. vi., part 2). PERUVIAN GUANO, NITRATE OF SODA, BONE DUST, SULPHURIC ACID, and all other Manures of known value. The PEAT MOSS CHARCOAL COMPANY have appointed the undersigned Sole Agents for the Sale of this fixer and distributor of Ammoniacal matter. They are also Sole Agents (in London) of the Patent Sanitary Company for the sale of their "Nitrogenised Carbon."—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

NITROGENISED CARBON MANURE. — This powerful Manure will be found an excellent substitute for Guano, AT LESS THAN HALF THE PRICE. It contains a large proportion of Ammonia, in addition to all the highly fertilising salts, phosphates, and fœcal matter, in solid and liquid sewage, in a concentrated form, absorbed into Shale Charcoal. This will be found a genuine article, as proved by the analysis of Professor Way, the Chemist of the Royal Agricultural Society of England, and, quality considered, is by far the cheapest Manure in the market, and being perfectly dry and pulverised, it may be easily distributed in any quantity per acre that may be desired.
Price Five Guineas per ton at three months' credit, or a Discount of Five per Cent. for cash. Bags and Packages included; delivered free to any Railway Terminus or Wharf in London.
Address to the Secretary of The Patent Sewerage Manure Company, 22, Lincoln's Inn Fields.

BARTON'S PATENT STABLE FITTINGS AND ENAMELLED MANGERS.—These Fittings have all the newest improvements, and are the only patented invention of this description.
JAMES BARTON, Iron Founder, Smith, &c., 370, Oxford Street, a few doors East of the Pantheon.

AN ACCOMPLISHED FACT.
RICHMOND AND CHANDLER (in competition with the best selected Chaff-Cutters of the most celebrated makers in the world), at the Show of the Royal Agricultural Society of England, held at Lewes, have carried off the highest prize of 10*l.*, eliciting at the same time the most marked approbation of the Consulting and other eminent Engineers connected with the Society.—Implement Works, Manchester, and 32, South John Street, Liverpool.

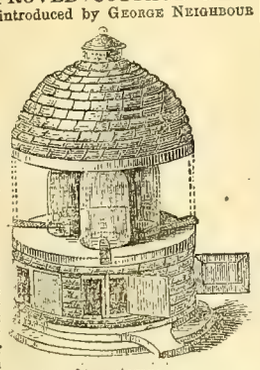
CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*
WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

IMPORTANT TO AGRICULTURISTS.—Few are aware of the great saving which can be effected by using ASPHALTE FLOORS for FARM BUILDINGS of every kind. It resists alike the action of damp and vermin, secures the health of the Cattle, and saves the whole of the money now laid out in manufactured manures.
For further particulars, apply to HENRY BURGESS, Asphalte Manufacturer, Torriano Avenue, Kentish Town, London.
Estimates given and Work executed in the most substantial manner, in all parts of the Country.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

BEEHIVES.
NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.



This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.
Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.
Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, F. & A. DICKSON & SONS, 106, Eastgate Street; Glasgow, AUSTEN & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

WARNER'S PATENT FARM AND COTTAGE PUMPS.
Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

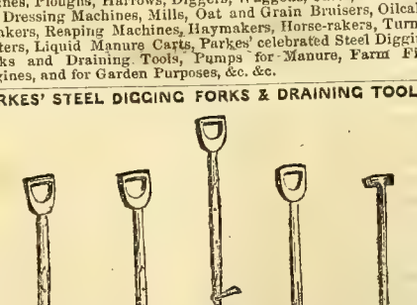
	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,
JOHN WARNER & SONS,
8, CRESCENT, JEWIN STREET, LONDON.
Every description of Machinery for Raising Water; Fire Engines, &c.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. 'PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

SAMUELSON'S PRIZE FORKING or DIGGING MACHINE, as applied to Spring Cultivation, serves to thoroughly pulverise land which has been trodden by sheep or autumn ploughed, deepening the staple, leaving no pan, dragging up the Couch Grass, and preparing a finely divided seed-bed.
Extracts of Testimonials and references to persons using it.
"Answers thoroughly; brings everything to the surface."—*E. W. Wilmot, Congleton.*
"The very best a man can have upon a mixed or stiff soil, it so thoroughly pulverises it."—*Joseph Cooper, Acton Burnel, Salop.*
"I inform you, with the greatest satisfaction, of its success."—*Francis Hamilton, Friars Place, Middlesex.*
"Attached horses at half-past 8, on 5½ acres, finished at a quarter past 3, making first-rate work."—*J. Kirby, Bodicott, Oxon.*
"Has been working every day."—*T. Cardus, Barwell, Surrey.*
"Will do a given amount of labour, not only cheaper but better than the plough."—*J. J. Mechi, Tiptree, Essex.*
"Let me have one at your earliest convenience."—*Earl of Essex, Cassiobury, Herts.*
"Send to Exton Park one of Samuelson's Forking Machines for *Earl of Gainsborough, Oakham.*"
"Besides improved tillage, economises ploughmen."—*P. Gener, Cuba.*
"Been digging all the week; the *champion* of all implements in England; should be very sorry to be deprived of it."—*Thomas Lawrence, Thurlaston, Dunchurch.*
"Well satisfied last year. Turnips were a superior crop."—*C. Brickwell, Overthorpe, Northamptonshire.*
Price 24*l.* 10*s.*, the general purpose size; and 27*l.* 10*s.* large size, Cash; at the Works, Banbury.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.
Chemistry—J. A. C. Voelcker, Ph D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
The next SESSION will begin early in AUGUST. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.
The GUIDE TO THE ROYAL AGRICULTURAL COLLEGE FARM may be obtained of HAMILTON, ADAMS, & Co., Paternoster Row, London; and EDWIN BAILY, Cirencester. Price 1*s.*

PRIZES AND MEDALS.
THE CELEBRATED NEW TURNIP CUTTER and ROOT SLICER will compete for the GRAND PRIZE at the Bath and West of England Meeting.
KEALY AND CO., 369, Oxford Street, London.

THE THIRD CHELTENHAM SUMMER POULTRY SHOW will take place at that magnificent establishment PITTVILLE SPA, on the 14th and 15th of June. For Prize Lists and full particulars enclose a stamped directed envelope to JESSOP BROTHERS, Secretaries.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.—The Show at Berwick-on-Tweed takes place on the 1st, 2d, 3d, and 4th of AUGUST, when Premiums to the amount of 1500*l.* will be offered for Stock and Implements.
All Entries must be made on or before June 17. Prize Sheets and Forms of Entry to be had on application to the Secretary, 6, Albyn Place, Edinburgh.
JOHN HALL MAXWELL, Secretary.

The Agricultural Gazette.

SATURDAY, JUNE 3, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, June	7	—Agricultural Society of England.
THURSDAY, —	8	—Agricultural Imp. Society of Ireland.
WEDNESDAY, —	14	Agricultural Society of England—Professor Way's lecture.
THURSDAY, —	15	—Agricultural Imp. Society of Ireland.

WE have lately tried to obtain the services of an experienced and intelligent man for the management of a large farm in one of the central counties of England: and have been struck by the abundant confidence of the several candidates for the office, and their apparently easy estimate of the qualifications needed. The farm contains probably a thousand acres, of which about 800 are still an unenclosed dry heathy moor. The climate of the district is sufficiently moist; and its light sandy soil, under good management, will grow Turnips and Barley readily enough. At present, however, the greater portion of it is in a state of nature, and the crop it bears is ling.

Now, just think of the many important questions on which the advice of the farm-manager is needed. He has first to frame a scheme of cultivation; and, supposing the whole farm brought under it, he has, after calculating the kind and quantity of stock which it will maintain, to determine the kind and quantity of accommodation required for it. Farm buildings have to be erected. It is a matter of much difficulty to decide upon their position in the case of a long narrow farm of such extent. The mansion or farmhouse and some few buildings are already built at one end of this long strip, and unfortunately at the narrow end of it, for it widens out considerably at the other. And whether or in what degree the new buildings are to be a mere addition to the old—or if they shall be erected in one or in two positions on the wider end of the estate; and, if so, how the several portions of a complete farmery are to be distributed amongst them—whether each shall be complete in itself, containing stack-yard and root-store, granary, and straw-house, yards, stables, stalls, and boxes (a portable threshing machine being employed to travel from one to the other, as litter is wanted at each); or if each shall contain a portion only of a complete set of buildings—the breeding stock, for instance, and the fixed threshing machinery, the granary and the rick-yards, and a portion of the stabling being placed around or near the tenant's house; while accommodation for the young and fattening stock, and for sheep, and for some of the horses of the farm, is provided at the other stations nearer where the manure is wanted, and the labour too: all these questions will be decided mainly upon the advice of an intelligent farm-manager.

The decision here does not merely concern the investment of a sum of 2000*l.*, it influences the annual expenses and returns of the farm for ever after—placing the tenant in a groove, as it were, from which no escape will afterwards be possible; and this, in the case of so large a business, is a matter of very great importance.

Then, supposing a decision to be arrived at, and the quantity and kind of the accommodation needed, with its position on the farm, to be fixed, there still remains to be designed the arrangement of each set

of buildings within itself, so as to ensure economy of labour—the planning of each separate farmery for the purpose it has to serve. Here, too, the advice of the manager is required, and would be followed.

This is not all: the heath has to be reclaimed piecemeal: two hundred acres have to be educated per annum—brought out of the wilderness and made productive. How is this to be done without abrupt interference with the existing plan of operations? or, rather, what is to be the plan of operations which shall not be annually upset by the sudden influx of so much more to be arranged each year, but which shall, instead, naturally stretch year by year at the rate proposed, without any breakage or confusion. The difficulty is so to crop the fresh instalment every year that it shall yield an increased maintenance uniformly throughout the period. It is easy to decide off-hand that one-half of every annual slice cut off the waste shall grow corn and the other half green crop; it is not so easy to arrange the cropping of the green-crop half so as to ensure a monthly increase of provision for the larger flock of sheep and herd of cattle, which will thus year by year have to be kept until the whole work is completed. And yet this has to be done, and it is the work of the bailiff to do it.

Apart, too, from the scheme of cultivation, think of the responsibility connected with the selection and purchase of stock. Annually so many more horses must be purchased. The sheep stock and the cattle have yet to be selected, and annual purchases must be made until the capabilities of the place are fully developed. Here too it is not the mere expenditure of so much of an employer's money; it is his committal to a system and a policy, good or bad, for future years, that is the really important aspect of the matter.

Consider, too, the experience needed in the selection and purchase of tools and machinery — whose threshing machine, whose steam-engine, shall be purchased—whose plough, harrow, grubber—what roller, presser, clodcrusher, may be needed — and what power to work these implements, and with them cultivate 1000 acres of such light sandy soil —all these are questions awaiting the decision of the bailiff.

Lastly, and chief of all, there are the resolution, temper, and energy required to manage and direct the manual labour needed — the prejudices of the district against innovation to be overcome — and the goodwill and hearty co-operation of the working men to be secured.

Here is surely scope enough for the exercise of a very high order of ability and a very great amount of intelligence. Those who have charge of the agricultural education of our future land agents and farmers would do well to consider whether the intelligence and ability which they are trying to confer will fit their pupils for a field like this. It is when the practical business of farming is commenced that the real relative importance of the different branches of an agricultural education becomes apparent, and that experience in the field and in the market is seen to be essential. That there is no lack of confidence among the young men offering for situations of the kind is plain from our experience of the last few days; what sort of a foundation it is built upon is an altogether different thing.

The manufacture of Animal and Vegetable Matters—such as fish refuse, butchers' offal, urine, sawdust, moss or peat earth—into manure, and their application to the soil, has long been a subject of anxious inquiry; and that part of it involved in the proposition of Lord Berners, of mixing sawdust with sheep's dung and urine, like other suggestions for economising the volatile and soluble elements of manure on the farm, now so frequently wasted, is deserving of special notice at this time.

Glancing briefly at old practices first, our forefathers used sawdust for littering their stables, cow-houses, sheep-pens, piggeries, and poultry houses, the whole being afterwards mixed together and used as farm-yard manure. Sawyers and carpenters, again, who had none of the above provisions, mixed it in their dunghills for growing Potatoes; while fishermen used it for smoking fish, and mixing in their ash-pits along with fish refuse, selling the compost to farmers. With these practices many localities are familiar to this day, and have been so from time immemorial.

Of these plans, the mixing of sawdust with sheep's dung, urine, slaughterhouse and fish offal, is, perhaps, the most deserving of consideration, because the fermentative qualities of such articles are the best adapted to overcome the comparatively indestructible nature of the dust. Hitherto the great objection to sawings of wood, as manure, has been their slow decomposition. Immediate activity is necessary to give value to manure, and this is what sawdust does not possess. Excrementary and offal matters, on the contrary, are from their nature subject to rapid decomposition, so much so, that half their fertilising value is not unfrequently lost. Indeed it is impossible to estimate the loss arising from this source. Now, if the mixing of the two together will effect the decomposition of the former, while it avoids the loss sustained in the latter, the gain must consequently be great.

What gives peculiar value to composts of this kind is their disintegrated state: they are fit for drilling in along with the seed by Corn or Turnip drills at once. Their freeness from sand and other heavy and comparatively useless mineral substances is another merit. The difference between the expense of applying farm-yard manure and guano, for instance, is considerable, while the advantages gained by expedition in seed time are even of greater importance. The addition of 50 per cent. of sand and clay (as when urine, fish gut, &c., were mixed with earth) doubles the expense and time of application; and this, if the distance is great, may exceed the value of the manure itself.

The prime cost of the article would be little more than the carriage, while in most localities the supply would obviously be great. We have only to examine our timber yards for evidence of this. How many ingenious plans have even been contrived for carrying the sawdust down the stream which drives the saw-mill, or into the fire of the steam engine where steam power is used.

Now that artificial manures have become an agricultural necessity, it is the duty as well as the interest of every one to look first to the resources within his own reach for a supply, and *lastly* to the market for any balance required. To neglect the former, relying entirely upon the latter for Peruvian guano, &c., and then complain of high prices, is inconsistency and folly. Were every farmer to procure annually so many tons of sawdust, ground peat, or charred vegetable matter of any kind, which could be had for little money, and to mix them with the excrements of horses, cattle, sheep, pigs, poultry, &c., adding such other articles as peculiar circumstances required, it would exercise a very salutary effect upon the extravagant prices now paid for all kinds of artificial manures. If a farmer can thus manufacture at home as good an article for 20*s.* as he can purchase for 5*l.* (and this can be done in many cases), the course which he ought to steer is plain.

GAIN OF WEIGHT IN CATTLE FEEDING.

In the various publications to which I have had recourse, with the view of informing myself as to the treatment of cattle, I have found no attempt to estimate and distinguish the gain of useful material made by them in the process of fattening. On seeking to explain my views on this subject, I feel less hesitation, as I supply data and figures from which my conclusions are derived, the soundness and correctness of which it is not difficult to estimate and ascertain.

The cattle I prefer for fattening are well-grown heifers, or cows which have had their first calf at three to five years old. The breeds of this district are to a considerable degree short-horns, the bulls used being more or less of this description; they may be termed of 'fair' to 'good' quality. Their live weight, when bought in a lean store condition, ranges from 7 cwt. to 9 cwt.; their capability of carrying weight, when prime fat, may be taken at an addition of 3 cwt. Although it is not used to kill beasts in a store state, and little positive information can be gained as to the carcase weight of lean stock, yet, from observation and inquiry, I am disposed to think that this will be less than one-half of the live weight, probably not more than 43 to 47 per cent. In Morton's Cyclopedia treatise "On Meat," the comparison of carcase to live weight is stated as 50 to 55 per cent when half fat, and as 61 to 63 when prime fat, for cattle of the like quality. I quote this as tending to confirm what I have stated as to the comparative proportions in lean stock.

I will consider, for example, a lean animal weighing 8 cwt., and capable of weighing when prime fat 11 cwt., live weight; when fairly started, and with proper feeding, I should look for a gain of 14 lbs. per week, which in my practice is a moderate average; at this rate it would require 24 weeks to bring it to a state of prime fatness. On comparing the weights when lean and fat —8 cwt. or 64 stones lean, at 45 per cent, will leave 28¾ carcase weight; 11 cwt. or 88 stones fat, at 60 per cent., will leave 52¾ carcase weight. The difference is 24 stones, or 14 lbs. per week, for the 24 weeks, being precisely the gain per week in live weight.

During the progress of feeding there is a gradual increase of interior fat of two descriptions—fixed fat in the loins, commonly called suet, which will vary from 8 lbs. when lean to more than 30 lbs. when fat, this is weighed with the carcase; and loose fat, or tallow, which counts as offal. If we take two beasts of equal live weight, and suppose, on killing, one contains 9 stones of loose fat or tallow, the other only 5 stones; now, though this loose fat counts as offal, it is known that the carcase weight of the animal with the 9 stones of loose fat will be heavier than the one with only 5 stones. A consideration of this matter led me to infer that, with the increase of interior fat, there occurred a displacement of material in the process of evacuation. On inquiry of butchers of experience with whom I deal, they tell me that it is a characteristic of a beast, which "proves" well, to have a little stomach. On looking over the items of offal they appear capable of little increase or variation in one or the same animal, with the exception of tallow and of the stomach, in the weight of each of which there is a difference of 100 lbs. or upwards. I observe that the writer of the paper from which I have quoted attributes this comparative increase in the carcase weight of fattened beasts to its greater solidity, to hollows being filled up, and protuberances being formed; it seems, however, clear that this would equally affect the live with the carcase weight, and therefore does not satisfactorily explain the matter.

If my premises be correct, it will appear that, besides the gain of carcase weight (which is shown by comparison to be 14 lbs. per week on an animal which gains this in live weight), there is an additional gain of interior loose fat which counts as offal. From observation and inquiry I am led to think, then, that this will not be less on the average than 3 lbs. per week, or, in the 24 weeks, 72 lbs. of loose fat, making together 17 lbs. per week gain of useful and vendable material—a result at variance with the impression I held before I entered upon this inquiry. I may at some future time seek to draw attention to the probable proportion and description of this material gained in the process of fattening. *Y.*

VISIT TO TIPTREE HALL.

(*Concluded from page* 347.)

On viewing the homestead, the first building noticed was that used for the house-feeding of sheep. This shed, about 40 feet in length by 18 feet in breadth, contained about 40 South-down hoggets, which appeared to be healthy and in good condition, their average dead weight being about 10 stones each; they were feeding upon Mangold Wurzel, Rape cake, and hay chaff, and their laying was composed of wood spars 3 inches wide, and placed 1½ inch apart; under this wood frame was a tank or pit about 2½ feet in depth. Upon examination of this pit it was found to contain both the solid and liquid excrement dropped by the sheep, and the shed being well constructed for ventilation, there did not appear to be any effluvium arising from this mass of manure at all likely to damage the health of the animals. This pit having connection with the huge tank, can be readily emptied, and it can also be made available for the purpose of manufacturing manure fit for use by the ordinary drill, by being partly filled with ashes or other suitable materials. I think the only improvement to be made in the construction of these floors would be to place the spars 1 inch apart, instead of 1½ inch, as it is now used. This is altogether the best accommodation for the house-feeding of sheep which I have seen, being superior to that in use at Swainston, in the Isle of Wight, by the late Sir Richard Simeon, and also that of the Rev. A. Huxtable, in Dorsetshire, both of which I had seen some years ago, and it is much preferable to the ordinary mode of feeding sheep in yards or sheds, where they are littered with straw. The foot disease is almost sure to attack the animals where straw bedding is used, whereas in this case general good health of the sheep may be expected, from the effect of the dry clean floor, and the purity of the air. The steam-engine, which is a powerful one, was next seen, and the threshing and dressing machine, with the chaff-cutting, corn-bruising, and other appliances, are of a complete and effective description. At one end of the straw barn temporary accommodation was afforded for 12 young beasts, which had been recently purchased, and were placed here awaiting their turn for removal into the bullock sheds. The boxes for fatting cattle were now noticed; and the floor, and the pits underneath for receiving manure, were constructed upon the same principle, the only difference being a somewhat wider space between the spars, with greater strength and substance in the cross bars. It was stated that in these boxes, which were about 12 feet square, two beasts were usually placed for the early period, but after they become forward in condition, they were separated and had a box to themselves. The bullocks seen here were fit for the butcher, and, it was said, were just sold; they however looked remarkably clean and healthy, although the pits were observed to be quite full of manure under them; yet the air, owing to the completeness of the ventilation, was comparatively pure and untainted. These animals were fed in part with steamed chaff, having meal mixed with it, which I thought the best and most economical mode of using meal for feeding beasts which I had seen.

The next building observed was appropriated to young store beasts, and they were accommodated in like manner with the fatting beasts; and, according to their age, they were in good condition, and their general appearance was growing, clean, and healthy. Eight or ten steers, seen feeding on the Italian Rye-grass in the open field, would have been better placed in this shed, and soiled here. Passing on to the adjoining shed, I found the fatting pigs were lodged precisely upon the same plan as the sheep, and I must say no animals upon the premises looked so well as they did. The sheds were narrower than those in use for sheep, but the floors and the manure pits were of the same construction. Two of these sheds were noticed containing from 12 to 15 porkers each, all of which appeared quite fat enough for the market. Another shed contained hoggets of the Down and Leicester cross-breed, which

were kept exactly in the same kind of building as that before described, but the ventilation was noticed in this case as being superior.

The next object which engaged attention was the boxes appropriated for the use of the store pigs and breeding sows. I do not know that the plan adopted was approved by the owner. I however found them in boxes having two compartments, one for resting and another for root feeding, &c.; both were quite small and under cover; the roof was much too low, and the place ill ventilated. They were littered with straw. I approve of the practice of bedding with straw for breeding and store pigs; at the same time I believe that they are best cared for when each sow or lot of pigs has its apartment for undisturbed resting, allowing a space of 8 feet by 12 feet under cover, and also a space of 12 feet square out of doors or uncovered, in the absence of a covered homestead, where it may receive both trough food, or roots and green crops; this space would likewise afford room for a moderate amount of exercise, so essential to the well doing of breeding animals.

The cart-horse stables were not very conveniently placed in connection with the other buildings, but very well constructed, having paved brick floors, with gutter to drain away the urine; plenty of space was allotted for the horses, and the stable lofty and well ventilated. After having seen all the buildings, it occurred to me that their relative position and general arrangement was defective, and somewhat inconvenient; it is, however, only justice to Mr. Mechi to say that he acknowledged this, and stated that the erection of some of these sheds was not contemplated at the commencement, and that in case his plans had been matured from the first, that he would have constructed and arranged his buildings in a different manner.

The extent of Tiptree Hall farm, belonging to Mr. Mechi, was stated to be 140 acres of land, and I was also informed that he occupies about 30 acres in addition, which he has recently hired. The whole of this land is under tillage, except 6 acres of permanent pasture. It appears to me that this farm, like much of the land between this and London, is naturally of a retentive character, the subsoil being comparatively impervious, and composed of strong clay, in some parts mixed with gravel and rock-stones. The surface is for the most part composed of a clay-loam; a portion, however, near the house is of a gravelly nature. In estimating the value of this farm, taking it on the whole at the commencement of Mr. Mechi's occupation, I reckon the value of the annual rental to have been about 18*s.* per acre. It is, however, now much changed; for the draining (although somewhat incomplete), the forking, and breaking-up the subsoil, and the removal of the rock-stones, together with the present buildings, and modern appliances now available, have raised the value of the land, and it may be now fairly estimated to be worth 35*s.* per acre as the annual rental. I must further observe that this farm (with the sole exception of a portion where the drainage is not quite effective) now contains all the elements of successful farming, and without reference to the money which has been previously expended upon it, I say, without hesitation, that it may be made profitable in occupation, at the above named rental, without the annual outlay of so large a sum for feeding stuffs as Mr. Mechi has been in the habit of expending for some years past.

I now propose offering a few remarks which have occurred to me, resulting from the inspection of this farm. I think 20 acres of the land may be advantageously laid into permanent pasture, or otherwise 20 acres of land sown to Italian Rye-grass, in addition to the quantity of land now under that crop. The permanent pasture may be made highly productive by the application of manures in a liquid state, and its general advantages for sheep pasturage would be great; in case of any extension of the breadth of Italian Rye-grass, the crop as fast as it becomes fit for soiling should be cut and removed daily, and the liquid manure applied close upon its removal. I do not consider feeding upon the land advisable for this crop during the summer months, as it seriously interferes with the succession, upon the quickness of which its value so much depends. With regard to the management of sheep stock upon this farm, it is a question with me whether they would not yield more profit, and more benefit to the land, if they were kept entirely in the open fields during both summer and winter (even admitting that the animals would make more meat for the food consumed, if fed in house during the four winter months); for the cost of removal of root crops and its attendant expenses will, I imagine, be found greater than the gain to be obtained by house-feeding, when compared with a well-conducted system of feeding roots in the field, the method of trough feeding being of course adopted. If, however, anything in connection with the rotation of crops can justify a deviation from open field feeding in the winter months, it is the completeness of the arrangements here for shed feeding. In the case of neat cattle it is very different; for both young stock, and fatting beast, ought to be kept and fed entirely in the house, during summer and winter, and the method of soiling and removal of the crops must be considered best in conjunction with liquid manuring. I would here remark, that the best recognised principle in the practice of manuring is the use of stable, box, or yard manures fresh and unfermented for application to the cereal and pulse crops, and that of liquid manures for green crops, Grasses, and for roots.

It was particularly noticed in the field arrangements here how easily and beneficially all the seeds of root crops may be put in with the liquid drill; the drill tank may be filled with liquid in any quantity, at any part of the field, by the aid of the hose here in use, the manure being used in such a state of dilution as may be desirable, and in admixture with superphosphate or other artificials. Upon inquiry I found that the liquid drill had not been in use here; I must, therefore, recommend it to favourable consideration in connection with the management of this farm.

Mr. Mechi, in his lively and confident manner, told me that the system of liquid manuring must become general, that we must all adopt it sooner or later. In reference to this observation, I beg to say the principle must certainly be recognised as one of the great improvements of our time, both for the purpose of irrigaton, and also for the dispersion and application of fluid manures. If we look to the Government report of the Board of Health, it will be found that upon several farms in England and Scotland the system of liquid manuring and irrigation by steam power has been successfully and profitably carried out. In connection with this subject, irrigation is only a matter of expense, for in various parts of the kingdom I have seen much pasture land in a comparatively barren state which may be made highly productive by lifting water with steam-power to the required level, and distributing it for irrigation upon the principle adopted in catch meadows.

In conclusion, I must say, that although Mr. Mechi may not have made his system of liquid manuring profitable at the commencement, yet the persevering manner in which he has continued it, has attracted so large a share of public attention that it will eventually lead to great and beneficial changes, both in irrigation and the application of liquid manure. *J. B., May* 16.

Home Correspondence.

Thick and Thin Sowing.—Never in our remembrance did corn of all kinds look more encouraging than at the present time; and where it is isolated and not planted too thick, an unusually abundant crop may be expected. Last season we stated the possibility of obtaining from single grains of Wheat, at the extreme distance of three feet apart, upwards of 80 perfect ears, containing 50 kernels each, or more than 4000 fold. Our specimens of last year, and of the growing crop this season for inspection, corroborates the assertion. This gives upwards of 10 qrs. per acre, from two pints of seed. We are also prepared to prove that isolated plants, one foot apart, at about six pints of seed per acre, will, under judicious treatment, also produce as great a crop; but if planted closer than this standard, it is an utter impossibility, as the plants then cannot perform their natural capabilities. Respecting the opposite extreme—thick sowing, we now make the bold statement that every grain of corn, whether Wheat, Barley, or Oats, sown in the United Kingdom, simply from its extreme thickness, does not, and cannot yield one ordinary ear, say 40 fold (nay, not even half as much), from each grain; and were it so, as a necessary consequence, it would produce, of course, 40 times as much per acre as is sown, say 2 bushels or 128 pints of Wheat, and 3 bushels or 192 pints of Barley and Oats, as an average quantity of seed usually sown. But such crops are never realised. Objections are raised, that by thin sowing late mildewed crops are sometimes the consequence; granted — but sowing early will be found to obviate this evil, and ensure more forward and bountiful harvests. *Hardy and Son, Maldon, Essex.*

Labourers' Friends. — Last year an agricultural society in Lincolnshire received an offer of a premium from a gentleman landowner of the following nature:—One portion of the reward was to be given to the married couple, and the other to the single labourer, who should have been most frequent and devout in their attendance at the parish church during the past year, the same to be certified by the minister and churchwardens. Considering that the society had other objects than proselytising for the Established Church, and that moreover some dissenter might be stepping forward, and (though inconsistent with his principles) offer a similar premium for attendance at chapel, the proposal was at once declined, and, upon a repetition of the offer, again rejected. *C.*

A Note from Tuam.—Great breadth of Potatoes planted. Emigration not abating. Labour risen considerably. Provisions very dear. Land letting much higher than in 1853. Sheep lower; Cattle also; but not low enough for spring. *Ballandyne.*

The Digger, by Samuelson, of Banbury. — Having purchased one of these implements in June, 1853, and Mr. Samuelson having made use of my name, I think it but due to the public and the inventor to state that the favourable impression I formed of this most useful implement is more than confirmed by another year's trial of it. I have used it this season on all my Turnip fallows, and have found it superior to any other implement, both in the economy of labour, and the excellency of its work—indeed, without it I could not have got some of my fallows ready during the late dry weather. I find two horses and three bullocks will do 3 acres per day on a strong retentive loam. *E. W. Wilmot, Congleton.*

Agricultural Meteorology.—"R." asks me, at page 347, to state the causes and particular phenomena of the storm's-eye, and how the calm in the centre is produced. I have much pleasure in offering my suggestions for his consideration, premising only that all arguments based upon the height of any atmospheric column, or upon any assumption of what the pressure may be, three miles or 30 above our head, must, to a very great degree, be mere assumption. Until balloon ascents are systematised, the small amount of information hitherto derived from that particular source can only be looked upon as the most interesting ground-work of induction, but still only as the ground-work. Air and water being both fluids, "R." may see what gave me my first idea of the rotatory storm's-eye, if he will pull up partly the hatch which regulates the flow of water from any mill-dam that may be near him. Immediately the downward pressure of the waters will cause a hollow cone to be formed, into which he may thrust his walking-stick several inches below the surface of the mill-dam without wetting it. Similar to this I conceive to be the atmospheric fluid which is carried round and round with an upward, instead of downward tendency, from its pressure upward. The calm in the centre of the water is produced by its pressure downward, and by the circular movement; in like manner the calm in the centre of the atmosphere, viz., the storm's-eye, is produced by its pressure upward, and the cause of that upward pressure is the expansion of the air from being heated, *i.e.*, as soon as air is heated it rises. The motion of the earth round its axis causes the heated fluid to rotate in contrary directions on different sides of the equator; and as the area over which this influence extends is enlarged—in other words, as the column expands—so the storm's-eye will extend; *i.e.*, the calm clear weather will prevail over a larger space in a high latitude than in a low one, in England than in the West Indies. Lastly, the particular phenomena attending the approach and passage of the storm's-eye are, a falling barometer with a rising thermometer and cloudy weather, probably with rain; then the weather clears up, and some hours of clear bright sunshine ensue, the barometer still being low; then the wind goes round to the contrary direction, and the barometer begins to rise, and the sky clouds over again; the changes of the wind will, however, depend on whether the observer be in the centre, or at the side of the storm's-eye. In reference to a quotation of "R's" from one part of my recent communication, "a rotatory column of atmosphere having a height of 30 or 40 miles," I quite agree with him that such a thing (probably) never occurs in our (nor in any) latitude: I merely assigned that height hypothetically, though for the purpose of the objection I then had under consideration, the greater the height of the column the stronger would be that particular objection, and, therefore, I put the adverse hypothesis most unfavourably to myself. My own opinion is that three or four miles above the earth's surface is probably the utmost extent of these rotatory influences; but this must be, after all, as I have already said, to a great extent, mere matter of assumption. *F. P. B. M., May* 31.

Societies.

KELVEDON, *May* 16.—*An Evening with Tusser.*—We have been favoured with the MS. of a lecture giving a very admirable review of Tusser's life and writings, delivered by Mr. Crane, of Kelvedon, and from it we make the following extracts on the life of the poet:—

In early youth his father seems to have destined him for the church, then in the throes of the Reformation, and he was sent to the collegiate chapel of the Castle of Wallingford. This arose probably from his possessing an unusually musical voice, and he speaks of it as quite against his own will, as well as that of his mother. After a harassing time, apparently at different places, leaving us to infer that his voice was the cause of his trouble, he ultimately reached St. Paul's, and speaks with gratitude of his progress in music under the celebrated John Redford, organist and almoner of that cathedral. From St. Paul's he went to Eton, where he experienced sharp discipline, and probably good teaching, for he progressed to Trinity Hall, Cambridge. He recounts the pleasant way in which his time passed here "with learned men;" but was driven by long sickness to leave his books and seek his fortune at the court, where he obtained employment, probably in his musical capacity, through the influence of his patron, William Lord Paget, the first titled ancestor of the Anglesey family, of whom he speaks in terms of affectionate gratitude. He remained in this position about ten years, which must have been during the latter part of the reign of Henry VIII., and the first years of Edward VI.; his patron, who had been in great favour, about this time fell into disgrace, and was sent to the Tower; and Tusser, being disgusted, as he says, with the vices of the courtiers, and his views probably baffled by the fall of his patron, for, he says, "the court began to frown," married, and began business as a farmer at Catwade, a hamlet in the parish of Brandham, in Suffolk, on the river Stour, which divides that county from Essex. One could scarcely imagine a less eligible training for the calling than his had been, as a singing boy, student, courtier, and musician. He must then have been over 30 years old, and started apparently ignorant alike of the theory, if there were theorists in those days, and the practice, rude as it then was, of husbandry.

It was here that he composed, or "devised," as he terms it, his "Book of Husbandry," the first edition of which was published in 1557, and dedicated to his patron, William Lord Paget, who, having adhered to the Popish party, had regained his influence, and held the office of Lord Privy Seal under Mary. He must have been engaged in farming for some years before producing even the rude essay which first issued from the press, and which formed the germ of his more perfect work, for in it is found a correct outline of agriculture, which could only be drawn by a practised hand, and the filling in and finishing of the picture seems to have been the solace and the business of his future life. This was the second book on agriculture that was printed in the English language, Fitzherbert's "Booke of Husbandrie" being the first. The work seems to have become extremely popular at once, and edition after edition issued from the press, polish, amplification, and continual additions marking its growth. Within comparatively a few years of its first appearance, Tusser's work was reprinted upwards of 20 times, and yet scarcely a copy of these early editions has been preserved, a proof that it had been sedulously applied to those purposes of instruction for which it was so admirably designed. As is remarked in the "British Biographer," "some books become heir-looms from value; and Tusser's work, for useful information in every department

agriculture, together with its quaint and amusing observations, perhaps passed the copies from father to son, till they crumbled away in the bare shifting of the pages, and the mouldering relict only lost its value by the casual mutilation of time." Copies of the modern edition, by Dr. Mavor, published in 1812, are scarce, and I am indebted to the kindness of our honoured chairman for the use of that from which the present paper has been compiled. I can think of no piece of mediæval literature that seems to promise a more liberal return, in a pecuniary point of view, than a cheap reprint of the works of the old Rivenhall rhymer.

The illness of his wife, and the too probable embarrassment of his affairs, induced him to quit Catwade, and he is found successively at Ipswich, at Dereham Abbey, and at Norwich, at which latter place Salisbury, the then Dean, of whom he speaks in terms of warm gratitude, is supposed to have obtained for him the place of a singing man in the cathedral. Tusser, compelled to quit Norwich by a painful disorder, afterwards farmed the glebe and tithes of the parish of Fairstead, in our neighbourhood, where he seems, however, as usual, to have been unsuccessful. We find, even at this early period, that the tithes were evaded as much as possible; for though he himself repeatedly speaks of the honest payment of the impost as a religious duty, he attributed his own failure in some measure to the opposite practice of the parishioners of Fairstead—

> "The tithing life, the tithing strife,
> Thro' tithing ill of Jack and Gill,"

drove him from Essex to London, whence, frightened by the plague of 1574–75, he again sought Cambridge, and found an asylum in Trinity College, which had been founded since his youthful sojourn at the university. On the cessation of the plague he returned to the metropolis to get a living by his voice or his wits, and died there about the year 1580. He was buried in St. Mildred's church, in the Poultry, where an epitaph, probably written by himself, and which is given in Stow's "Survey of London," recorded his memory. This monument perished, of course, with the church, in the great fire of London.

For an author the vicissitudes of his life present an uncommon variety of incident: "without a tincture of careless imprudence," says Warton, "or vicious extravagance, this desultory character seems to have thriven in no vocation;" and Fuller, in his "Worthies of Essex," quaintly remarks, "that his stone, which gathered no moss, was the stone of Sisyphus. He was successively a musician, schoolmaster, singingman, husbandman, grazier, poet, more skilful in all than thriving in any vocation. He traded at large in oxen, sheep, dairies, grain of all kinds, to no profit. Whether he bought or sold he lost; and when a renter, impoverished himself and never enriched his landlord. Yet hath he laid down excellent rules in his 'Book of Husbandry and Huswifery,' so that the observer thereof must be rich. He spread his bread with all sorts of butter, yet none would stick thereon; yet I hear no man to charge him with any vicious extravagancy, or visible carelessness." I might quote the testimony of many other eminent writers to the moral worth of our poet, and the merit of his rhymes, while all lament his ill success in life. In that age of quaint device and allegory, a scythe and whetstone seems to have been thought an apt emblem of poor Tusser. This is found in Peachum's "Minerva," a book of emblems, printed in 1612, with a poetical commentary, and the same idea is more tersely rendered in a work printed in 1641, entitled "Recreations for Ingenious Head-pieces, or a Pleasant Grove for their Wits to Walk in," thus—

> "Tusser, they tell me, when thou were alive,
> Thou, teaching thrift, thyself could'st never thrive,
> So, like the whetstone, many men are wont
> To sharpen others when themselves are blunt."

Mr. Crane then took his hearers through the several chapters of the "500 points of good husbandry," making ample quotations in illustration of the manners of the times, the condition and the skill of those then engaged in agriculture, and of the peculiarities and fortunes of the poet. For this we have not room. Our readers must betake them to the volume itself. Mr. Crane, we are informed by Mr. Mechi, the President of the Society, succeeded in interesting a numerous and intelligent audience.

Reviews.

The Cultivation of Dartmoor. A Prize Essay. By Henry Tanner, Estate agent, Exeter.

To the pamphlet before us was awarded the prize offered by the Western Literary and Scientific Union, for "the best essay on the cultivation of Dartmoor as a source of employment for the unemployed population of the district." The subject is interesting, not only as furnishing the opportunity of discussing the relations of climate and agriculture under extreme circumstances, but, especially at the present moment, in its connection with the question whether or not our convict labourers can be profitably employed.

One of the best instances of successful agriculture in the district is that of our correspondent, Mr. Fowler, of Prince Hall, of whose proceedings Mr. Tanner speaks as follows:—

"Not long after Mr. Gullet commenced his operations at Prince Hall, he disposed of the property to Judge Buller, who advanced the improvements, and extended the enclosures; but it remained for his successor to show to what a degree of perfection agricultural operations could be carried out on Dartmoor. This property was purchased by G. W. Fowler, Esq., in 1846; he has since resided upon the estate, and personally superintended its improvement. Numerous as have been, and still are the difficulties with which he has had to contend, yet he has now the satisfaction of seeing the delightful change which has followed his labours, proving what may be done in the cultivation of this comparatively unproductive moor. I feel I should ill discharge my duty, in making a report of this district, did I not name Mr. Fowler as deserving the thanks of the public, for having at a great sacrifice of personal comfort, and risk of capital, gone boldly forward as the pioneer of improvement. The importance of his operations cannot be too highly appreciated by those who are desirous of seeing Dartmoor affording employment to the pauper, good investment to the capitalist, and wealth to the country. He has brought a large portion of his estate into a very high state of cultivation, and has succeeded in growing excellent crops. During the seven years he has cultivated that previously unproductive tract of land, numerous opportunities have arisen for making conclusive trials of the suitability of climate and soil for agricultural purposes; and I feel personally indebted to Mr. Fowler for his kindness in placing at my disposal much practical information which is embodied in this essay.

"His example has not been without its influence upon others. The deeply rooted prejudice which existed in the minds of the moor farmers against deep cultivation, or, as it is locally termed, 'ploughing up the deads,' has been overthrown. The land which was thus treated, instead of being 'utterly ruined' as they predicted, has been thereby much increased in fertility, and thus objectors are compelled to approve of the practice, and when able they venture to adopt it. But by far the most important result of his successful endeavours to develope the agricultural capabilities of Dartmoor, is the attention it has received from Government, and the important step which has been taken in establishing convict prisons at Prince Town. I look upon this proceeding as introducing a new era in the history of Dartmoor, for the means at the disposal of a government enable them to prosecute works of such extended character, as quite eclipse the most zealous and praiseworthy operations of private individuals. I consider this portion of the moor as the centre from which cultivation is to radiate on all sides; and although it is as 'an oasis in the desert,' yet eventually luxuriance and fertility will pervade the face of Dartmoor."

The Dartmoor prisons, originally erected for the accommodation of prisoners of war, have latterly been devoted for the use of convicts.

"The interior of the building has been remodelled and admirably adapted to the requirements of the system which is so ably carried out in that establishment; the work having been chiefly executed by convict artizans. From 1100 to 1300 convicts are generally stationed here, and are employed in reclaiming and cultivating the surrounding moor — planting — making and repairing roads—building—cutting turf for fuel and converting it into gas, by which the prisons are lighted—and a variety of other manual operations. The work is very effectually done, and the aspect of the neighbourhood is already much changed—fertility is beginning to spread where all before was barrenness, and luxuriant crops have taken the place of the heath and the furze. Splendid crops of Turnips, Swedes, Belgian Carrots, Barley, Oats, Flax, and Vetches, have been produced here (1400 feet above the sea), and also a large supply of culinary vegetables for the prisoners. Farm buildings have been erected, a dairy established, and arrangements made for the production of a portion of their animal food. About 50 acres of irrigated meadow-land are being prepared below the prisons, which will be watered with the sewerage from this establishment and the barracks. The produce from these meadows will be almost incredible. The land being naturally of good quality, and well underdrained, the manure will exert its full effect upon the Grass, and this in a climate peculiarly adapted to its growth. Already on a portion which had been levelled and drained, and which but a few months before had been a bog impassable for man or beast, they cut upwards of one ton per acre, of excellent hay, after the use of some sewerage water; what then will be the produce when the land has been sown with good Grasses and a firm sward is obtained!

"By means of a large force-pump (worked by manual labour), which has been erected over the tank which receives the liquid manure from the prisons, all the sewerage can be thrown into another tank, built upon the highest portion of the land in their occupation; and thus, aided by a series of these receptacles, the liquid can be stored, or distributed over a great extent of land with a hose. If at any future time it is thought desirable, these higher lands can be laid down in Grass, and irrigated with the manure water. The time is not far distant when this establishment will be enabled to raise all the agricultural produce that is required for its support, with the exception probably of Wheat, and thus become eminently self-supporting."

Mr. Tanner gives a great deal of useful information on the cost and methods of the different processes employed in reclaiming the moor — as planting and draining, building, roads, and fencing. As to the capabilities of the soil when properly cultivated, the following may be taken as an encouraging testimony:—

"It is very important to know what crops are suited to the moor. Of the corn crops, Oats stand first—the soil and climate are both favourable, and consequently valuable Oats have been grown here. Rye is probably well suited for moorland cultivation; and although for many years past its culture has not been carried out on Dartmoor, yet from the general use of Rye-straw as thatch on the old cottages and farm-buildings, we may infer that it has been extensively cultivated. Flax has been grown with success; but this delicate plant cannot support itself against the winds of the moor until their violence is subdued by extensive planting. Its growth at the present time is very uncertain from this cause; but if shelter could be obtained, it might be cultivated with the greatest success. Barley has been grown of excellent quality; but, although in some seasons it has been very successfully cultivated, yet I consider it too delicate for profitable growth at present. Wheat, Beans, and Peas, are decidedly unfit for cultivation on Dartmoor. The Scotch Bere or Big will, in all probability, answer well here. It is somewhat similar in character to Barley, and is cultivated in districts unsuited to the latter; the advantages are, it does not require such a favourable climate, and ripens at least 14 days earlier; but the produce, although much inferior in quality, is found to be valuable food for stock. Potatoes were grown successfully until the appearance of the disease, now so general amongst them. The quality grown was excellent, and large quantities were sent to the London markets, where they realised high prices. Spring and winter Vetches, Grasses, Clovers, Rape, Turnips, and Swedes, succeed admirably, and produce abundant crops. Many of my readers, no doubt, will remember the fact of the prizes for Swedes and Turnips, offered by the South Devon Agricultural Society, being awarded for two years in succession to the same person, occupying land —not in the rich district of South Devon—but on Dartmoor, 1100 feet above the sea. The judges in awarding the prizes, declared the weight of Mr. Fowler's crop to be—

	Tons.	cwt.	qrs.	lbs.	
Swedes, without tops and bottoms	35	11	1	16	per acre.
White Turnips, with their tops on	43	8	1	6	"

This will be satisfactory proof that the climate and soil of Dartmoor are highly favourable to the growth of these roots. The Mangold Wurzel is of a different habit, and prefers a drier climate; but, although not so productive as the roots just named, yet from its valuable property of keeping good so late in the spring, it should be grown to a small extent. The Carrot may be looked upon as a rather more productive crop than the Mangold, and the variety of food renders its cultivation desirable."

On the most Economical and Profitable Method of Growing and Consuming Root Crops. By W. C. Spooner, of Eling House, Southampton. Prize Essay. Ridgway, Piccadilly.

We call attention to the timely publication of this essay in a separate form. It was first published in the second volume of the Journal of the Bath Society, where it occupies the leading place. It is a very useful practical account of root growing, and well deserves an extensive circulation.

The Illustrated Book of Domestic Poultry. Edited by Martin Doyle. Routledge & Co., Farringdon Street. This is a handsomely decorated volume, full of descriptive and useful matter relating to all our principal breeds of poultry, given in a chatty readable manner. Too much space is occupied with mere anecdote and ornament, but that will not be objected to by the large class of amateur poultry-fanciers for whom the book is intended, and for whom it is well adapted.

Poultry.

Vitality of Eggs.—A friend and neighbour of mine, possessed of a valuable breed of fowls, has been in the habit of selling eggs to breeders in the breeding season at a high rate, and out of the season to shopkeepers and others at a low rate, in the latter case always taking care to prick them (having heard that if pricked they would not produce a chick), in order to prevent people getting his breed of fowls at the rate of "20 for a shilling." Now, having reason to suspect that chickens had been hatched from some of his pricked eggs, he has made the following experiment. He found a thrush's nest with four eggs in it, and pricked them all, some at the large end and some at the small end, and allowed the thrush to sit unmolested. The result is that there are now three young birds in the nest, and an addled egg, which egg was pricked at the small end. These eggs were not merely pricked through the shell, but the pin nearly touched the opposite end. Since then my friend has pricked five eggs of another thrush, all at the small end, the result of which, if of any interest to you or your readers, I will forward you in due course. *Little Chingey.*

Golden Pheasants: The eggs of golden pheasants vary so much in price that we scarcely know how to advise you. We have known them sold at prices varying from 10*s.* 6*d.* to 21*s.* per dozen.

Miscellaneous.

Sale of Short-horns: Aberdeenshire, May 24.—Mr. Strafford conducted the sale of the herd of pure short-horn cattle, the property of J. C. Grant Duff, Esq., of Eden. The following were among the sums realised, together with the names of the purchasers:—

	gns.
Jenny Lind, red, calved 17th March, 1847—Mr. Tanqueray, Brent Lodge, Hendon, Middlesex	100
Miss Bates the Second, red and white, calved 21st January, 1849—Mr. J. G. Wood, Castlegrove, Strabane, Ireland ...	70
Pure Gold, roan, calved 25th January, 1849—Mr. Cruickshank, Sittyton	91

Venus, red and white, calved 4th June, 1852—Mr. Cartwright, Aynhoe Park	95

Thirty cows, heifers, and heifer calves yielded 1555 guineas, or upwards of 50 guineas each: 10 bulls and bull calves yielded 278 guineas, or nearly 30*l.* apiece.

Crops in East Lothian.—The acreable produce of this county has been greatly increased from two causes —thorough drainage and the application of guano. From the former the average extent under Turnip has been quadrupled; from the latter the average weight of bulbs has been increased by at least 4 tons per acre. Without the aid of guano, manure for the breadth of land now capable of growing root crops could not have

been obtained. The average produce of Wheat, from these two causes combined, has been raised not less than 8 bushels per acre. If ten were named it would not exceed the real increase. Barley and Oats have also been increased at least by 12 or 14 bushels; Beans by 8 bushels; while Potatoes could not be grown to one-half the present extent without these two powerful agents—thorough drainage and guano. The average weight of Turnips grown may be estimated at 18 tons per acre. The Swede occupies less than one-third; the Purple-top Yellow and White Globe occupy the largest space. Since the introduction of Skirving's Purple-top Yellow, the Swede has been restricted in breadth. The average produce of Wheat per acre for the whole county, for the last five years, may be taken at 31 bushels; Barley at 44; Oats, 50; Beans, 28; hay at 3360 lbs.; Potatoes at 5¾ tons per acre. The average weight of Wheat per bushel is 62 lbs.; Barley, 55; Oats, 42½; and Beans, 66. The weight of the straw is seldom ascertained, except in experiments. It varies considerably, being dependent on variety grown, season, and nature and condition of the soil. These averages are much above those in the Statistical Returns. It must, however, be kept in view that the crop of 1853 is confessedly below an ordinary average. *From the Report on the Farming of East Lothian, by Mr. Stevenson, in the Eng. Ag. Soc. Journal.*

Improvements in Churns. By Theophilus John Nash, of High Holborn, Middlesex. Patent dated March 9, 1853. (No. 600.)—The inventor describes and claims a combination of apparatus for giving an up-and-down and rotary motion to the dashers of churns, such motion being communicated by a winch-handle, on the axis of which is a toothed wheel, which takes into and gives a motion to a similar wheel. On the axis of each of these wheels is fixed an eccentric, and between the two eccentrics there is a disc, which is affixed to the spindle of the dasher of the churn, and which, by the rotation of the winch-handle, will be caused to rotate, and to rise and fall. *Mechanics' Magazine.*

Calendar of Operations.

MAY.

WEST SUSSEX, *May* 29.—Since our last report we have had the weather very favourable; showers have been frequent, and not heavy, and the clay lands that were very much rent have now got closed. Grass, which was rather scarce at one time, is now coming up well, and is gaining upon the cattle, consequently all kinds of lean stock have become very dear, and are likely to be so. We must put off hay-making to a later season than usual, but we do not think it will be such a light crop after all, as there is a thick under-growth coming up, which will help to make it up. Wheat looks vigorous, although, now and then, we find a brown leaf, perhaps the result of the frosty nights that we have had so often, and which in some places have done much damage to both Wheat and broad Clover, and also Peas and Beans, but this is only partial, and I have seen but little of it. Mangold, that we sowed the first week in this month, is up pretty well, but does not grow so fast as if we had warmer weather. Barley that was sown early has come up very irregularly, and may be a very uneven sample. Beans are generally a short crop, but here they look healthy, and are coming in flower. Peas are good at present, and some that were sown early in February have been in flower for 10 days. Potatoes, so far as I have seen, look fair, but not over luxuriant. I should think that the cold weather that we have had will prevent that rapid growth which some say is so likely to attract disease. Great faith is put in the sharp frost that prevailed through the winter. We are now about to begin getting in Swedes, and they and Turnips will be got in as soon as possible after this; and if early sowing have any effect on producing a good crop we may look for a better supply of them than last year, as most are ready to put them in quickly, the preparation of the land having been got well forward. There have been several pieces of Trifolium sown for this season; but it has not generally turned out well. Some has been eaten by the slug, and has come in patches; but where it is, it is good; and could we get a regular plant it comes in very useful, as it is early. *G. S.*

Notices to Correspondents.

AGRICULTURAL EDUCATION: *Hazel.* A year at the Agricultural College commencing in autumn—a winter in Professor Way's laboratory—and a second year with a good business farmer—would, we think, turn out an intelligent and practical agriculturist. We should prefer Berwickshire, Norfolk, Lincolnshire, or Sussex, to Cheshire, as the scene of an agricultural education.

CART: *S W.* Had the firm of Messrs. Stratton and Co. been still in existence we should have referred you to them. You had better apply to their late foreman and successor, Mr. Chard, Milk Street, Bristol.

PRIZE FOR ARTIFICIAL GUANO: *F Atlee.* The mistaken idea that the British Government had offered a premium of 4000*l.* to the inventor of an artificial guano has probably arisen from the fact that the English Agricultural Society (11, Hanover Square, London) has offered a prize of 1000*l.* for the same thing. The conditions of this latter prize may be learned, we believe, by application to the above address. You will have seen in the last number of this journal that no fewer than 143 competitors for this prize have appeared, each of whom professes to supply a manure equal in fertilising properties to Peruvian guano, at a price not exceeding 5*l.* per ton, and in quantity sufficient for all demand.

SALT: *W H.* Blackie's Cyclopedia refers pretty fully to its uses as a manure. Johnston's "Agricultural Chemistry" refers to it also, in detail. We know of no work specially on its uses as a manure, but may state generally that it has been found especially useful for Mangold Wurzel, for which it has been applied along with ordinary manure, at the rate of 4 cwt. per acre with advantage; and also for corn crops on rich lands, where it is believed to have tended to the strength and cleanness of the straw. You may apply 2 cwt. per acre in wet weather, broadcast, over any growing crop, probably with advantage in localities at a distance from the shore.

TO PUT A COW DRY: *J L.* A dose of salts, such as sulphate of magnesia, 12 oz., with 2 drachms of ginger dissolved in warm water, will generally accomplish the purpose. *W. C. S.*

VETCHES: *Inquirer.* They admit of but one cutting. We do not know how it may be if mown before the flower-buds have formed; but they would then prove physic rather than food.

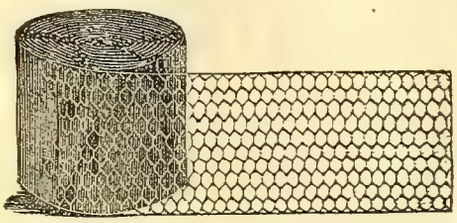
WHEAT: *F D.* You would get some autumn feed by hoeing in Italian Rye-grass while the ground is still damp. If the thinness takes the form of entirely blank patches, these might be sown with Buckwheat as you propose, but Buckwheat sown *among* the thin Wheat would so overgrow it as to render it almost impossible to harvest it.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

H. J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.

GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.

Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

PATENT WIRE STRAND FENCING FOR PARKS, &c.

This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

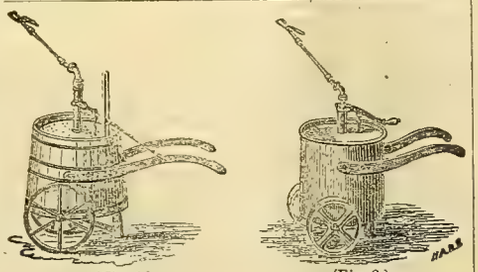
IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7*d.* per yd.	5*d.* per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1⅝-inch " light " ...	8 "	6 "
1⅝-inch " strong " ...	10 "	8 "
1⅝-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich; and delivered free of expense in London, Peterborough, Hull, or Newcastle.



(Fig. 1.) (Fig. 2.)

No. 14 " 30 " " 45 " ...	5 18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

JOHN WARNER AND SONS,

CRESCENT, JEWIN STREET, LONDON.

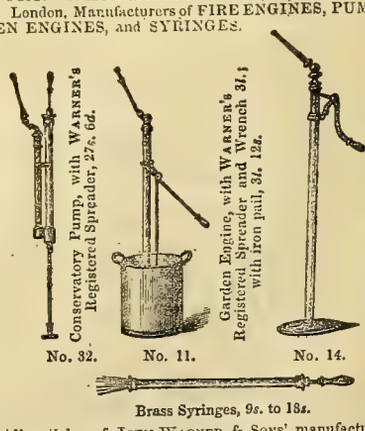
GALVANISED IRON TUB GARDEN ENGINE,

With Warner's Registered Spreader,

Is strongly recommended, for durability and low price, viz., 27. 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.



Conservatory Pump, with WARNER'S Registered Spreader, 27*s.* 6*d.*
Garden Engine, with WARNER'S Registered Spreader and Wrench 3*l.*; with iron pail, 3*l.* 12*s.*
Patent Conservatory Pump, with WARNER'S Registered Spreader, 2*l.* 13*s.*; with iron pail, 3*l.* 5*s.*
No. 32.
No. 11.
No. 14.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

RICK CLOTHS, MARQUEES, TENTS, ETC., NEW OR SECOND-HAND, FOR SALE OR HIRE.

BENJAMIN EDGINGTON has, for the ensuing season, an extensive assortment of Marquees, &c., for Horticultural Societies, Fêtes, Cricket Clubs, &c. Rick Cloths, with poles, pulleys, and lines complete. A variety of Emigration Tents erected on the premises, No. 2, Duke Street, Southwark. Netting and Bunting for Fruit Trees.

Warehouse, 32, Charing Cross, where Tents are erected. Address by post, No. 2, Duke Street, Southwark.

JAMES PHILLIPS & Co.,
116, BISHOPSGATE STREET WITHOUT.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

MORNING FROSTS.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1s. 6d. per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Re-Regent Street, London.)

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, ETC.

JAMES LYNE HANCOCK'S VULCANISED INDIA-RUBBER TUBING is now manufactured especially for the above purposes, and is of greater flexibility than any other description of hose or tubing. It is also manufactured to resist great pressure, suitable for attaching to the mains of water works or to tanks, or water butts of high elevations. WATERING HOSE fitted up with brass joints, branches, stop-cocks, roses, and jets complete. Vulcanised India-rubber suction pipes for pumps any length or size to order; HOSE for brewers' use, fire engines, &c. VULCANISED INDIA-RUBBER WASHERS, for Steam and Water Joints, and VULCANISED RUBBER in sheets of any size and thickness. Solid vulcanised India-rubber Tubing and Cord, for the joints of glass-doors, sashes, frames, &c.—Prices and every information may be had on application at the Manufactory, Goswell Mews, Goswell Road.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40s. Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

IMPORTANT TO GROWERS OF ROSES.

NEWLY-INVENTED APHIS BRUSH, OR GREEN FLY DESTROYER.—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the Rev. E. S. BULL, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage. Price 2s. 6d. each.

MANUFACTURED BY
JOSLING AND SONS,
IRONMONGERS, Colchester.

Retailed by all the principal Ironmongers.

Wholesale agents: W. Thompson and Son, 15, Upper North Place, Gray's Inn Lane Road, London.

PROTOXIDE ANTI-CORROSION PAINT, for all external purposes, on iron, wood, brickwork, or stucco, is cheaper, and more durable, than any similar article.—Manufactured by CHARLES FRANCIS & SONS, Cement Works, Nine Elms, London.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

DEAFNESS, SINGING IN EARS, & NERVOUS DEAFNESS.—New mode of instantly restoring hearing, without operation, pain, or use of instruments.—By one consultation, a permanent cure is guaranteed to any sufferer, although partially or totally deaf for 40 or 50 years. This extraordinary discovery is known and practised only by Dr. HOGHTON, the eminent Aurist of the Suffolk Place Institution, and is applied by him daily on numbers of deaf applicants with perfect success in every case, enabling deaf persons instantly to hear conversation with ease and delight. Testimonials can be seen from the most eminent physicians in England; also certificates from all the London Hospitals and Dispensaries, and numbers of letters from patients cured, in all grades of society, from the peer to the peasant. Dr. HOGHTON, Member of the London Royal College of Surgeons, May 2, 1845; L.A.C., April 30, 1845. Consultations every day from 12 till 4, without payment of fee, at his residence, 9, Suffolk Place, Pall Mall, London.

Just published, Self-cure of Deafness, for Country Patients; a Stop to Empiricism, Quackery, and Exorbitant Fees. Sent on receipt of seven stamps, free.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 2, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2l. 14s. to 5l. 10s.; ditto, with ormolu ornaments and two sets of bars, 5l. 10s. to 12l. 12s; Bronzed Fenders complete, with standards, from 7s. to 3l.; Steel Fenders from 2l. 15s. to 6l.; ditto, with rich ormolu ornaments, from 2l. 15s. to 7l. 7s.; Fire-irons from 1s. 9d. the set to 4l. 4s. Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1 and 2, Newman Street; and 4 and 5, Perry's Place.

ONE THOUSAND BEDSTEADS TO CHOOSE FROM.

HEAL AND SON'S Stock comprises a large assortment of handsomely Japanned and Brass-mounted IRON BEDSTEADS, CHILDREN'S CRIBS and COTS of new and elegant designs; MAHOGANY, BIRCH, and WALNUT-TREE BEDSTEADS, of the soundest and best manufacture, many of them fitted with Furnitures, complete; and every variety of SERVANTS' and PORTABLE BEDSTEADS. They have also a large assortment of

BED-ROOM FURNITURE, comprising WARDROBES, both in Japanned Wood and Mahogany, from 4 feet to 8 feet long, fitted with every variety of arrangement; DRESSING TABLES and GLASSES, WASH-STANDS, DRAWERS, and every article for the complete furnishing of a Bed-room.

HEAL & SON'S ILLUSTRATED CATALOGUE OF BEDSTEADS and priced List of Bedding, containing designs and prices of upwards of One Hundred Bedsteads (representing a stock of upwards of One Thousand), sent free by post.
HEAL & SON, 196, Tottenham Court Road, London.

TYLOR AND PACE have removed from 313, Oxford Street, to larger and more commodious premises, 104, New Bond Street, which will enable them to keep a much larger stock in all the different branches of their manufacture, including a very extensive assortment of Iron and Brass Bedsteads, Children's Cots, Portable Bedsteads, and Chair Bedsteads, with suitable Bedding and Mattresses. A Large Show Room is entirely appropriated to the exhibition of Baths and Toilette Ware of every description, all at the most moderate prices. An increased assortment of Venetian and all other Window Blinds, Outside Blinds, and Transparencies. Illustrated Catalogues of Bedsteads, Baths, and Window Blinds, are published separately, and will be forwarded post free on application by naming the description of article required.
TYLOR & PACE, 104, New Bond Street, London.

MR. MECHI, No. 4, LEADENHALL STREET, LONDON, feeling that these are progressive times, has made extensive alterations in his business Establishment, which he trusts will be for the comfort and advantage of his customers, by enabling them to inspect readily his general manufactures, consisting of articles of luxury and economy, suitable for presents or for use. Independently of his usual extensive stock of Ladies' and Gentlemen's Dressing Cases, Work Boxes, and Desks, in Wood, Morocco and Russian Leather, he has devoted one entire apartment to the most choice productions in Papier Mache Ware, contrasting strangely with the once much prized ware of Japan and China. Catalogues will be forwarded gratis on application. Mr. MECHI is preparing a very choice assortment of elegancies and utilities for sale at his Depôt at the New Crystal Palace. His position will be in the nave at the entrance to the French Court.

BERDOE'S VENTILATING WATERPROOF LIGHT OVER-COATS resist any amount of rain, without confining perspiration, the fatal objection to all other waterproofs, air-tight materials being unfit and dangerous for clothing, and being free from vulgar singularity are adapted for general use equally as for rainy weather. Price 45s. and 50s. A large stock for selection. Also of Capes, Shooting Jackets, Ladies' Mantles, Habits, &c.—W. BERDOE, Tailor, &c., 96, New Bond-street, and 69, Cornhill (only).

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses singularly nourishing powers in the growth, restoration, and improvement of the human Hair, and when every other specific has failed. This celebrated Oil is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. Its operation in cases of baldness is peculiarly active; and in the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulating operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3s. 6d. and 7s.; Family Bottles (equal to four small), 10s. 6d.; and double that size, 21s. CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines. The same are engraven on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

QUANTITY AND QUALITY OF THE HAIR.

NO TOILET can be considered complete without a careful attention to that department which so materially affects the entire contour, viz., the Hair, which, both in quantity and quality, is susceptible of the most material alteration. That which is weak can be strengthened, and be made to receive a most beautiful gloss by artificial applications. It is to its extraordinary and valuable properties in these respects that is due the character of C. AND A. OLDRIDGE'S BALM OF COLUMBIA, for its invigorating, nutritious, and regenerative qualities. OLDRIDGE'S BALM causes Eyebrows to grow, prevents the Hair from turning grey, and the first application causes it to curl beautifully, frees it from scurf, and stops it from falling off. Price 3s. 6d., 6s., and 11s. per bottle. No other prices are genuine. — N.B. Ask for OLDRIDGE'S BALM, 13, Wellington Street North, Strand, London.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.? If so, use Miss GRAHAM'S NIOUKRENE, the most efficacious Hair generant ever introduced. It reproduces the Hair when lost either by disease or decay, prevents its falling off, effectually checks greyness, strengthens weak hair, and is guaranteed to produce those attractive ornaments, Whiskers, Moustachios, Eyebrows, &c., in three or four weeks. For nourishing and beautifying the hair, and sustaining its curling powers in all weathers, it has no equal. Price 2s., and sent post free to any part of the kingdom, on receipt of 24 penny postage stamps, by ELLEN GRAHAM, 3, New Road, Hornsey, Middlesex.—"My hair is quite restored." Miss ORME.—"I have a full pair of Whiskers, thanks to your Nioukrene." H. ROBB, Esq.—"It has checked the greyness." Mrs. JONES.—"My hair is restored." Dr. COFFIN.

NEW VOLUME NOW READY.

Volume II., price 1s. 6d., in ornamental boards, of

Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

NOTE.—The Letters received daily at the Offices from this year's Customers fully support the high character this Manure obtained last year. A few are subjoined.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

THE "ECONOMICAL" MANURE,

SO CALLED, BECAUSE

1¼ to 1½ cwt. per Acre, costing 15s. to 18s., is ample, and fully equal to 3 cwt. of the best Peruvian Guano; thus saving at least 50 per cent., besides Carriage, &c.

THIS quantity is quite sufficient, and must on no account be exceeded, as injury instead of benefit arises if more is used, the Manure having been purposely manufactured in a highly concentrated state. It will be seen from the Testimonials below—

1. That "at a cost of 12s. per acre the Turnips were a most extraordinary crop."
2. With 1½ cwt. per acre they (the Turnips) "are equally as good as where I applied 3½ cwt. of superphosphate of lime per acre."
3. An expense of 23s. per Scotch acre for this manure produced Turnips "equally as good as those growing in the same field with 6 cwt. per Scotch acre of guano, at 10s. 6d. per cwt.;" making three guineas against 23s.
4. "I can see little difference in the two, where 1 cwt. per acre of this Manure was used against 3 cwt. of guano."
5. 7½ cwt. to 6 acres gave "a splendid crop of Turnips" from the Economical Manure alone, which cost 15s. per acre.
6. "The effect has been surprising on Turnips."
7. "Where I applied it the Turnips are much finer than usual."
8. "The fly has not taken them (the Turnips) so much as where guano was used."
9. On Mangold Wurzel, 1 cwt. per acre produced "the best crop I ever have grown."
10. In 1½ cwt. per acre against 3 cwt. of superphosphate, "the 'Economical' was superior."
11. Where guano and the Economical Manure were used, "it is impossible to tell one from the other."
12. "My Swedish Turnips are capital—the best, people tell me, in the whole parish."

N.B.—The following few Testimonials from the Company's pamphlets are given, because they are considered to embrace almost all parts of the United Kingdom, and although they refer only to the use of the Manure for Turnips and Root Crops, it has produced the most wonderful results last year on every kind of crop, and on all soils, far surpassing the expectations of the purchasers; and no one reading the Company's pamphlet can doubt its being by far the cheapest of all manures, as in fair comparative trials with guano, dung, and other long recognised fertilisers, it will be seen the "ECONOMICAL" was superior; that it is most valuable for fruit trees, shrubs, and garden purposes, and produces the most astonishing effects upon manure heaps, applied in solution, decomposing in 15 days all vegetable matter, peat included, and that it is a perfect deodoriser for liquid manure, besides enhancing its fertilising properties.

It is a chemical compound in a highly concentrated state, providing the plants with a large proportion of ammonia, which it has the property of attracting from the atmosphere and fixing in the soil, as well as the carbonic acid—two of the most energetic agents of vegetation. It is sold in a dry powdered state, and is the result of many years' labour of an eminent Foreign Agriculturist, the Director of the Government Schools of Agriculture in his own country, and of high reputation as a chemist. It is patented, and is one of the most useful and greatest discoveries of the day.

PRICE 12*l.* PER TON, Packages included, and delivered free on Rail or Wharf in London.

A pamphlet, containing further Testimonials (more cannot be given here), including those from France, Belgium, and Spain, with directions for use, samples, and all particulars, to be had at the Offices of the British Economical Manure Company, 10, Mark Lane, London; or sent gratis on applying to

BENJAMIN COVENEY, Manager.

TESTIMONIALS (being a few out of some Hundreds).

Mungalhead, Falkirk, Stirlingshire, N. B. Oct. 14, 1853.
I used the Economical Manure as follows:—I weighed it out at the rate of 210 lbs. per Scotch acre (a Scotch acre is about one acre and one-fifth English), bruised it very small, then properly mixed it with, say twice its bulk of light earth, the land a good loam, cleansed and ready for drilling; the mixture was then sown broadcast, the land drilled up double; we then sowed the Turnip seed, which brairded well, and they are now equally as good as those growing in the same field sown with 6 cwt. of guano per acre, at 10s. 6d. per cwt. What I would suggest is, if you think proper, that you insert an advertisement in our local papers, and refer to the Turnips now growing at Mungalhead, for inspection of the merits of the Manure. I think any one seeing its effects should be satisfied. WM. MORRISON.

Cublington Madley, Hereford, Jan. 2, 1854.
I used the Economical Manure for common Turnips, planted the first week in June; it was sown broadcast on the flat, and afterwards ridged up 20 inches wide. I put about 1¼ cwt. per acre, and on the other parts of the field 3 cwt. of superphosphate, and I am of opinion, with most persons who have seen the crop (which is a very good one), that the Economical is superior to the phosphate. GEORGE PYE.

Little Genoch, by Glenluce, Wigtownshire, N.B., Dec. 9th, 1853.
I applied about 4 cwt. of Economical Manure in a liquid state to about 60 cart-loads of farm-yard dung, which I used along with a small quantity of bones to my Turnip crop, and found the crop to be superior to that to which I had applied guano and bones. The Turnips are all grown in the same field alongside of each other. JAMES M'MASTER.

Carlisle, Dec. 5, 1853.
Mr. John Graham, farmer, Beaumont, near Carlisle, has a splendid crop of Turnips, grown entirely from the Economical Manure. He used 7½ cwt. to 6 acres, mixed with three parts earth to one part Manure. The mixture lay three days before it was put upon the ground. THOMAS BLACKLOCK.

Soham, Cambridgeshire, Oct. 4, 1853.
I used your Manure for Mangold Wurzel, broadcast: it was about the first week in May. I put about 1 cwt. per acre mixed with earth. I have the best crop I ever have grown, they looked so strong and growing all through the season. WM. C. PEEK.

Albion Foundry and Iron Works, Rugeley, Staffordshire, July 1, 1853.
I got a friend to test some on a Turnip crop against guano, and he says that his Turnips look best in that part of the field where he sowed the Economical Manure, and that the fly has not taken them so much as those where guano was used. He is a person well known in the neighbourhood; and when this becomes known I have no doubt I shall succeed in selling a good quantity. THOMAS HATFIELD.

Alwalton Lodge, Peterborough, Northamptonshire, Nov. 30, 1853.
Relative to the Economical Manure, I have to observe that I have not noticed it sufficiently to speak definitely as to the attendant results. The season was unfavourable, and I did not get the whole I ordered applied to my Turnips; but where I did apply it they are much finer than usual. The remaining portion I have sown broadcast on Wheat. I am so well satisfied as to its utility, that I shall be a customer on a rather larger scale another year. JOHN POLES.

Cairnsmore, Newton Stewart, Wigtownshire, N.B., Oct. 21, 1853.
I used your Manure for Turnips. I sowed at about 1 cwt. per acre, together with about 20 bushels of bones, and about 3 cwt. of guano, with the same quantity of bones in the same field, and I can see little or no difference between the two.
JAMES CARFRAE, Farm Manager to James Stewart, Esq.

Bodrhyddan, Denbighshire, N.W., Oct. 13, 1853.
I used your Manure for Turnips about the 20th of May. I applied 1½ cwt. per acre, together with about 2 tons of farm-yard manure. I likewise applied on every 20 alternate rows 2 cwt. of Peruvian guano, together with the above-mentioned quantity of farm-yard manure. The result in both cases is an excellent crop, and as near equal as I can judge. I may add, the land is a mixture of gravel and sand. WILLIAM BELL.

Cleves Cross, Durham, Oct. 11, 1853.
I have used the Economical Manure on nothing except Turnips. I sowed about 1¼ cwt. per acre alone, and about 2½ cwt. of Peruvian guano in the same field, and I cannot perceive much difference in the two. The soil is limestone gravel.
THOMAS THOMPSON.

Stoke Golding, Leicestershire, Dec. 10, 1853.
I tried the Economical Manure for Turnips, and the effect has been surprising. I manured some land equally with rotten dung, upon one part of which I put the Economical Manure. Where I did so, the Turnips are very large, while on that part which received the dung I have scarcely any Turnips at all. I consider the Manure most valuable. My crop will well repay for the extra outlay in the Economical Manure. S. LAW.

Shelford Manor, Bingham, Notts, Nov. 8, 1853.
Through the recommendation of Mr. E. S. Gisborne, Land Agent, Derby, I was induced to try the Economical Manure on a Turnip crop; and, for the purpose of giving it a fair trial, I selected a field of 30 acres, in a good state of cultivation and equal quality. This field I divided into three lots; one third was dressed with the Economical Manure, at the rate of 1 cwt. per acre; one third with kiln-dust of equal value; and one third with soot of equal value. I now have the pleasure of stating that the Turnips on the portion dressed with the Economical Manure are a most extraordinary crop, and surpass in size and vigour in a remarkable degree those on the land dressed with kiln-dust and soot. JOHN HASSALL,
Agent to the Right Hon. the Earl of Chesterfield.

Plascoch, Ruthin, Denbighshire, N. W., November 2, 1853.
I sowed 1½ cwt. of the Economical Manure to the acre, for Turnips on the flat, afterwards ridged up for sowing; but before it was covered the weather changed, and it lay exposed I dare say for a week, which no doubt would have a very injurious effect upon it. The Turnips, on some patches of it, are very strong; I have no doubt, had I been fortunate in its application, it would have answered well. I have a very good opinion of it.
FRANCIS CLARKE.

North Walsham, Norfolk, October 26, 1853.
I used your Economical Manure upon half an acre of land for Turnips (1 cwt. of it), and my Swedish Turnips are capital—the best, people tell me, in the whole parish. EDWARD MEADE.

Penkridge, Staffordshire, December 8, 1853.
Although the season has been very unfavourable for the trial of manures, I am quite satisfied that the Economical Manure is a valuable manure. The roots of the Turnips grown by it are equal to any I have grown this season with artificial manure.
CHARLES STUBBS.

Barley, near Royston, Herts, December 16, 1853.
The Economical Manure I ordered did not arrive in time to be used upon Swedish Turnips; I therefore used it upon Greentops. The way I tested it was this: the 12 cwt. was mixed with 80 bushels of cinder-ashes, and 4 quarters of malt-chimes, and that was put upon nearly 8 acres, making the expense, including carriage, &c., about 29s. per acre. There was no other manure used, except some burnt ashes from the Grass, &c., round the field; and there is a fine crop of Turnips. There is no doubt about the manure being good, as the difference of the deposit between the up and down-hill works plainly shows its utility.
T. C. WALBY.

West Bilney, Swaffham, Norfolk, October 13, 1853.
I applied your Economical Manure as a top dressing for Barley, at the rate of 1½ cwt. per acre, mixed with 20 bushels of burnt earth, and sown broadcast. I was quite satisfied with the result. I likewise drilled the same quantity for Turnips and find they are equally good as where I applied 3½ cwt. of superphosphate of lime per acre, at a cost of 1*l.* 1*s.*
R. H. WALPOLE.

Chilvers Coton, Warwickshire, Dec. 12, 1853.
I beg to say that the Economical Manure has given me great satisfaction. I used some for Turnips, and the result has been most satisfactory. I have no doubt it will be in great use here as soon as its good qualities become more generally known.
JAMES HANKINSON.

Hafod-y-Green, near Denbigh, N. W., Nov. 7, 1853.
The following is the manner in which I applied the Economical Manure:—A portion of a Turnip field was manured with about 20 tons per acre of the best stable and cattle dung, made during the winter; upon the remainder I put about the same quantity of inferior stuff, such as road-scrapings, cinder-ashes, &c.; to this I added about 1 cwt. of your Manure to the acre, hoping to equalise the crop; and at this time there is no difference to be seen in the field. I therefore consider your Manure made up the deficiency. The soil is a cold wet clay; but the crop is quite equal to my expectations. C. H. (Bailiff to J. Blew, Esq.)

Antingham, near North Walsham, Norfolk, Oct. 3, 1853.
I feel satisfied of the utility of your Economical Manure, in promoting the growth of Turnips. HENRY WRIGHT.

Lyde, Herefordshire, January 14, 1854.
I used one barrel of the Economical Manure for common Turnips, planted in July: it was sown broadcast on the flat, and afterwards ridged up 20 inches wide; about 1½ cwt. per acre. I perceived very little good for the first six weeks; afterwards the Turnips progressed very fast. But the land was not drained, and was very wet; yet I find them a fair crop. I have no doubt if the land had been drained I should have had double the quantity.
RICHARD EDWARDS.

Cosby Lodge, Lutterworth, Leicestershire, Dec. 15, 1853.
I used your Economical Manure at the rate of 1¼ cwt. per acre, to a crop of Swede Turnips. I applied it broadcast, and ridged the soil up afterwards with a small quantity of farm-yard manure. I am perfectly satisfied with the result, having a very good crop. Should I live till next year, I intend using it again.
JOHN DRAYCOTT.

Witton, North Walsham, Norfolk, November 1, 1853.
I used your Manure against two others, on the 30th of June, for Turnips, and have a splendid crop, beating both the others.
THOMAS CUBITT.

Moorgate House, East Retford, Notts, February 14, 1854.
I have been over to Mr. Johnson's, a large farmer in this neighbourhood, and find that in his Turnips, where guano and the Economical Manure were used, to the same amount in money, it was impossible to tell one from the other; in fact, neither he nor I could tell which was which, the crop from both being extraordinarily good. W. BOWER.

TESTIMONIALS OF 1854.

Cambridge, May 15, 1854.
I applied some of your Economical Manure to various crops this spring:—on two different fields of Wheat, a piece of Barley, 2 acres of Clover, and on some Autumn-set Cabbages. All I can say (and as it is the first year of my using the article), all I ought to say, is, that so far, the improvement in all the crops is most manifest, more especially in the Clover. But even on the Wheat and Barley, although applied invariably where the crop was weakest, its effects are so striking, that a person riding along the road cannot but perceive it. I have used it for Mangold Wurzel, and shall do so for Turnips, but as yet, in the former instance, the Mangold is not up, and therefore nothing can be said of it. It is but fair also to add, that I have applied it to two compost heaps; in reducing Twitch, Cabbage Stalks, and such like, to a useful compound for the land, with layers of horse dung, and with the exception of the windward side of the heaps, where the Couch Grass or Twitch was laid quite on the outside, the heaps, in three weeks, became excellent manure. So far, I have never expended 18*s.* per acre on any crops, after 40 years' experience, with so much effect. I think the agriculturists to whom I am known will give me credit for not intentionally misleading them. I write only the result of my own experience. You will immediately send me another ton, for my own use, and one for a neighbouring farmer. P.S.—I find 2 heaping bushels per acre of the manure, with the like quantity of ashes, seems to cost about 18*s.* per acre, and in this manner we have so far used it.
WILLIAM BENNETT.

[This gentleman is the well-known and practical Agriculturist, formerly of Lewsey, Bedfordshire]

Manea, near Chatteris, Cambridgeshire, May 17.
I beg to inclose an order for 24*l.* 19*s.*, the amount of your account against me for Manure. I should have forwarded this a little earlier, but having used the manure on 12 acres of Hemp, I waited to see if it had any immediate visible effect. I am happy to say I think it has, as the plant is vigorous and strong.
MICHAEL L. SEARS.

Halvergate Mills, Acle, near Norwich, May 18.
I am happy to give you an excellent account of the Manure. Mr. Smith, of Reedham, top-dressed a field of Wheat in the beginning of April, it was very thin and weak; he did not expect a quarter of a crop. The other day he was telling me it was wonderfully improved, and he did not think there was any in the parish looking better: so well satisfied is he with it, that he has given me an order for half a ton more for top-dressing Barley, also an order for a friend of his. You are quite at liberty to advertise this, as you cannot speak too highly of it. I shall require two tons instead of one. JOHN HEWITT.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The EXHIBITION of AMERICAN PLANTS (Rhododendrons, Azaleas, Kalmias, &c.) will take place on MONDAY NEXT, June 12. Tickets of admission can be obtained at the Gardens by orders from Fellows of the Society, price 5*s.*, or on the day of Exhibition, 7*s.* 6*d.* each.

The Gates open at 2 o'clock, at which hour the Bands attend.

SOUTH LONDON SOCIETY OF AMATEUR FLORISTS.—The Third Exhibition for this season will be held at the Horns Tavern, Kennington, on THURSDAY, June 22, when Prizes will be awarded for the following productions, viz., Miscellaneous Plants, Pelargoniums, and Fancy Varieties, Pinks, Roses, Ranunculuses, &c. In addition to the Prizes offered by the Society, P. Secretan, Esq., offers the Large Silver Victoria Medal for the best collection of 20 Stove Plants. An efficient band will be in attendance.

Admission to Non-Members from 2 till 6 a.m., at One Shilling each. List of Prizes may be obtained from

JOHN BUSHELL, Esq., Honorary Secretary, pro tem.

Lower Kennington Lane, Lambeth.

STAINES HORTICULTURAL SOCIETY.—The Exhibition of this season will take place on SATURDAY, June 24, by the kind permission of Mrs. Hagen, in the Grounds of Duncroft House, when a variety of prizes will be offered for competition. Schedules and further particulars may be had on application to W. WATKINS, Honorary Secretary.

MAIDSTONE HORTICULTURAL SOCIETY.—The following Prizes (open to all England), will be given at the Exhibition of the Maidstone Horticultural Society, on THURSDAY, June 29. For best 8 Stove or Greenhouse Plants, 5*l.*; Second, 3*l.*; Third, 1*l.* For best six Exotic Orchids, 2*l.*; Second, 1*l.* For best collection of 36 Roses, in single trusses, 2*l.*; Second, 1*l.* Entrance, Stove Plants, 7*s.* 6*d.*; Roses and Orchids, 5*s.*

Further particulars will be given on application to the Secretary, Maidstone. J. G. SMITH.

EXHIBITION OF AMERICAN PLANTS,
ROYAL BOTANIC GARDENS, REGENT'S PARK.

JOHN WATERER begs to announce that his unrivalled Collection of RHODODENDRONS, &c., is now in bloom, and may be viewed by tickets to be obtained of Fellows of the Society. The Plants at the Nursery are also in perfection, and may be seen gratis.

American Nursery, Bagshot, Surrey, near Farnborough Station, South Western Railway.—June 10, 1854.

EXHIBITION OF AMERICAN PLANTS AT KNAP HILL NURSERY, WOKING.—The American plants at this Nursery are now in bloom, and may be seen daily gratis. The Knap Hill Nursery is within an hour's ride of London, by South Western Railway to Woking, where all trains stop, and from whence capital conveyances may be obtained.—WATERER & GODFREY, late HOSEA WATERER.

T. ANSELL begs to inform his Patrons and Friends that he has an extensive and splendid collection of GERANIUMS, containing most of the newest and most approved varieties, both of show flowers and fancies.—A catalogue may be had on application.

Strong healthy Plants of the following kinds, 20*s.* per doz., viz., Ambassador, Ariadne, Breba, Col. of the Buffs, Coustantine, Enchantress, Eurydice, Ganymede, Ignea, Jullien, Little Nell, Lord Mayor, Nepaulese Prince, Purple Standard, Rubens, &c. Also the following fancies 20*s.* per doz., Advancer, Caliban, Captivation, Celestial, Erubescens, Fascination, Formosissimum, Gipsy Queen, Lady Downes, Marginata, Neree, Othello, Richard Cobden, Sambo, Triumphans, &c. Older varieties from 6*s.* to 12*s.* per dozen.

A large assortment of Chrysanthemums in small pots, well adapted for travelling, from 4*s.* to 12*s.* per dozen. Also a splendid collection of Dahlias, of which a catalogue may be had on application.—Camden Nursery, Camden Town, London.

PLANTS OF CABBAGE, SAVOY, KALE, BROCCOLI, CAULIFLOWER, AND CELERY.

JOHN CATTELL, Westerham, Kent, begs respectfully to inform the public that he has a plentiful supply of Plants of his superior true sorts of the above, which will be forwarded to order on receipt of Postage Stamps or Post Office Order made payable here at the following prices, package included:—All the sorts of Early Cabbage, Savoy, and Kale, including Brussels Sprouts, 6*d.* per 100; 4*s.* 6*d.* per 1000. All the sorts of Autumn and Spring Broccoli, and all the sorts of Celery, 8*d.* per 100; 5*s.* 6*d.* per 1000. Cauliflower, Early and Late, 10*d.* per 100. Red Cabbage, 1*s.* per 100; Drumhead, or Cattle Cabbage, 4*s.* per 1000. Packages of 1000 and upwards delivered free of Carriage to London, and to the Edenbridge Station of the South Eastern Rail.

Seed of Cattell's Dwarf Barnes, and of his superior Dwarf Reliance Cabbage, may be had in packets by post for 12 Penny Stamps per packet; the former containing one ounce as usual, and the latter half an ounce.

WELLINGTONIA GIGANTEA.

MESSRS. VEITCH AND SON are now prepared to supply healthy young established Seedling Plants of the above magnificent Tree. For terms, &c., see the Advertisement of their New Plants in another part of this Paper.

Exeter and Chelsea.—June 10, 1854.

LILIUM GIGANTEUM.

JAMES VEITCH, JUN., begs to announce that he has now in bloom a fine specimen of the above noble Lily, which it will be a pleasure to him to show to all lovers of flowers who may be pleased to visit his Nursery.

Exotic Nursery, Chelsea, June 10, 1854.

CHOICE CINERARIA AND CALCEOLARIA SEEDS.

LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior

CINERARIAS AND CALCEOLARIAS,

which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias and Calceolarias have given for several successive years enables them to recommend their Seed of the present season with much confidence.

Packets of each, sealed and warranted by them, at 2*s.* 6*d.*, free by post.—Exeter Nursery, Exeter, June 10.

BASS AND BROWN'S NEW POTENTILLAS.—In consequence of the limited stock of King of Crimsons, we regret we must decline receiving more orders. The following are now ready to send out:—

Potentilla Sudbury Gem, each	10*s.* 6*d.*	Potentilla Theodore, each	7*s.* 6*d.*
„ Shylock, do.	10 6	„ Julia, do.	7 6

The following, 16*s.* the set of seven varieties:—

Floral Beauty	3*s.* 6*d.*	Scarlet Gem	3*s.* 6*d.*
Napoleon	2 0	Primrose	2 0
Defiance	2 0	Argo	2 0
Negress	3 6		

For descriptions and editorial remarks, see *Gardeners' Chronicle* of March 13, p. 144, and April 1, p. 208.

Seed and Horticultural Establishment, Sudbury, Suffolk.

TURNIP SEEDS FOR PRESENT SOWING.

Ashcroft Swede	Sutton's Lincolnshire Red Globe Turnip
Skirving's Swede	Hardy Green Round
Sutton's Hybrid Turnips	Sutton's Green Globe
Skirving's Bullock Turnip	Tankard Yellow, and others.
Early Six Weeks Turnip	

SUTTON AND SONS, SEED GROWERS, Reading, have an excellent stock of the above sorts of Turnip Seeds on sale at moderate prices, as see Catalogue.

TURNIP SEEDS! TURNIP SEEDS!
CARRIAGE FREE.

B. PAGE AND CO.'S Genuine Stock, saved from the finest transplanted Bulbs, will, as heretofore, gain the greatest number of Prizes at Root Exhibitions.

Skirving's Improved Swede ... per lb.	1*s.* 0*d.*	Mangold Wurzel, Long Red, per lb.	0*s* 10*d.*

Red Round	1 0		
Early Stone	1 0		
White Belgian Carrot	1 8		

Offices, Oxford Street (ten yards from the Railway Terminus), and Above Bar, Southampton.

CHEAP BEDDING PLANTS.

JOHN MORSE begs to offer the following in good strong Plants, at 3*s.* per dozen, showing bloom.

Heliotropium corymbosum	Lobelia fulgens multiflora
„ Triomphe de Liege	„ Erinus ramosoides
„ Peruvianum	Anagallis, blue and red
„ Voltaireanum	Neirembergia gracilis
Calceolaria Sultana	Verbenas, in great variety
„ Sulphurea splendens	Petunias „ „
„ Amplexicaulis	Dahlias „ „
„ Floribunda	Fuchsias „ „
Lobelia Queen Victoria	Scarlet Geraniums „

Also a few dozens of the following beautiful Geraniums, strong, in 4-inch pots:—

Mountain of Light	12*s.* per doz.
Flower of the Day	7*s.* „
Cerise Unique	5*s.* „

No charge for Hampers or Package.

JOHN MORSE, Nurseryman, &c., Dursley, Gloucestershire.

A CARD.

JAMES DICKSON, NURSERYMAN and SEEDSMAN, cannot allow the present Planting and Seed Season to terminate without returning to the nobility, clergy, and gentry, and his numerous customers and kind friends, his most sincere thanks for the very gratifying and liberal support he has received since he has been joined in business by his SONS, which has far exceeded his most sanguine expectations.

The extensive patronage with which JAMES DICKSON & SONS have been favoured, and the large orders which have been entrusted to them for TREES and PLANTS, has induced them to break up and bring into Nursery cultivation a considerable quantity of fresh land, now planted with Nursery Stock, which, together with their having had allotted to them by purchase an extra portion of the Old Nursery Grounds, puts them in a position to execute orders, however extensive, with well rooted Plants, at the lowest possible prices. All orders entrusted to J. D. & SONS shall have the utmost dispatch, and their most careful and personal attention.

Seed Warehouse, 102, Eastgate Street, and 106, Deansgate, Manchester; and Nurseries, Newton, near Chester.—June 10.

FUCHSIA DUKE OF WELLINGTON.

J. MOORE AND SON beg to offer a few fine young plants of the above, which are from 1½ to 2½ feet high, well furnished with branches, and calculated to make fine specimens for the July Exhibitions. Price, 15*s.* to 21*s.* each. Also smaller plants, at 10*s.* 6*d.*, with usual discount to the trade. Good plants can also be supplied of Fuchsia Ariel, Beauty, Cartoni, Duchess of Lancaster, England's Glory, Glory (Banks), King Charming, Lady Franklin, Nil Desperandum, Sedonia, Voltigeur, and a fine Seedling not sent out, at 12*s.* the set. The above Fuchsias, with Duke of Wellington, are unquestionably the best in cultivation.—Perry Barr Nursery, near Birmingham.

NEW VARIEGATED GERANIUMS,
ATTRACTION AND SILVER KING.

JOHN AND CHARLES LEE are now sending out strong plants of these elegant novelties, which they can recommend as surpassing anything of the kind hitherto introduced.

ATTRACTION has a decided crimson horse-shoe, on a finely variegated foliage, which greatly enhances its beauty. The flowers are light scarlet. Price 10*s.* 6*d.* each.

SILVER KING is of a dwarf free habit, the leaves perfectly flat, with a very broad silver margin; flowers intense scarlet. Price 7*s.* 6*d.* each, or 70*s.* per dozen.

Nursery and Seed Establishment, Hammersmith, near London.

NEW SIPHOCAMPYLUS.

W. J. EPPS has much pleasure in offering the following, feeling they cannot fail to give the highest satisfaction. Strong plants are now ready for delivery.

SIPHOCAMPYLUS NE PLUS ULTRA—Very dwarf habit, with bright green foliage, producing flowers of the most brilliant scarlet in threes and fours at the axle of every leaf; the best of the genus, 10*s.* 6*d.*

BICOLOR ROSEA—Deep crimson, tipped with pale rose, very distinct and beautiful, very dwarf and compact habit; 10*s.* 6*d.* The usual discount to the Trade.—Nurseries, Maidstone.

CINERARIA SEED.

EDWARD GEORGE HENDERSON AND SON, Wellington Nursery, St. John's Wood, London, are now prepared to forward, by post, new Cineraria Seed saved this season. More than usual care has been bestowed in gathering from the choicest named varieties, including the new ones sent out last year; all the light varieties have been discarded, consequently from the above seed we anticipate none but high coloured flowers. Per packet, 2*s.* 6*d.* and 5*s.* each.

Our beautiful collection of CALCEOLARIAS can now be seen in flower at the Nursery and orders for seed booked, to be sent when ready. Per packet, first quality, 5*s.*; second quality, 2*s.* 6*d.*

NEW ROSES IN POTS, at reduced prices.

HYBRID PERPETUAL.		HYBRID PERPETUAL.	
Baronne de Kermont	5*s.* 0*d.*	Souvenir de Mdme. Lille	5*s.* 0*d.*
Comte de Nanteuil	5 0	Triomphe de Paris	5 0
James Veitch	5 0	Volta	5 0
Lady Stuart	5 0	BOURBON.	
Lady Shelley	5 0	Beauté Lyonnaise	3 6
Le General Jacqueminot	10 6	Madame Helfinbein	5 0
Madame Harriet Stowe	10 6	Sir Joseph Paxton	3 6
Madame Phelip	5 0	TEA.	
Paul Dupuy	7 6	Gloire de Dijon	10 6
Prince Chipetowzikof	5 0	MOSS.	
Prince Leon Kotchouby	7 6	Princess Alice (Paul's)	5 0
Salvator Rosa	3 6	HYBRID BOURBON.	
Sephora	7 6	President Pierce	7 6
		Vivid	5 0

The following choice Hybrid Perpetual Roses, at 30*s.* per doz., Baronne Hallez, Destigny, Egerie, Inermis, Laura Raymond, La Seduisante, L'Enfant du Mont Carmel, Louise Peyronny, Ludovic Letaud, Madame Audry, Madame Ducher, Madame Fremion, Madame Hilaire, Miss Meymott, Souvenir de la Reine des Belges.

BENJAMIN R. CANT, in offering the above, does so with the greatest confidence, as he has received several letters from customers stating that the plants sent are far better than those generally supplied by the Trade.

ST. JOHN'S STREET NURSERY, COLCHESTER.

Carriage paid to London and Norwich and all intermediate stations on the Line. Unknown Correspondents are requested to send a remittance or reference.

THE LARGEST & BEST TURNIP FOR EARLY SOWING.

SUTTON'S LINCOLNSHIRE RED GLOBE TURNIP.—A superior variety, presented to us by Philip Pusey, Esq., being more solid and larger than any other. Price 1*s.* 6*d.* per lb., or 9*s.* per gallon. Carriage free.

From Mr. Albert Edmonds, Steward to Philip Pusey, Esq., November 23d, 1853.

"By the desire of Mr. Pusey, I beg to inform you that he had a very fine crop of the Red Lincolnshire Turnip, weighing 30 tons 10 cwt. 1 qr. 24 lbs. per acre."

From Mr. T. Chandler, Liquid Manure Drill Maker, Aldbourne, November 11th, 1853.

"The Lincolnshire Red Turnip, the seed of which I had from you, has produced the heaviest crop I ever grew."

JOHN SUTTON AND SONS, Seed Growers, Reading, are receiving many orders daily for this Turnip Seed, with similar remarks to the above, relative to last year's crop. *Orders will be executed in rotation, in strict accordance with priority in our receiving them.*

RIVERS'S STUBBLE SWEDE, the best sort for late sowing.—Before Mr. Rivers offered this excellent SWEDE to the public, he favoured us with a sample to grow in competition with others in our sample ground; and being fully satisfied that it would be a great acquisition to Agriculturists, we gave him our opinion, which he published the following season in the *Gardeners' Chronicle* and other Papers. We have now the satisfaction of hearing from all parts of the kingdom that it not only thrives well when sown late, but that it is one of the best Swedes in cultivation. We have a fine stock of Seed grown from that received originally from Mr. Rivers, which we are now selling at 1*s.* 6*d.* per lb., or 9*s.* per gallon; 3 lbs. being fully sufficient for an acre. TIME OF SOWING—MIDDLE OF JUNE TILL END OF JULY.—Address,

JOHN SUTTON & SONS, SEED GROWERS, Reading, Berks.

GOOD FREE FLOWERING ORCHIDS.

THOMAS JACKSON AND SON beg to offer the following:—Acineta Barkeri, Acropera Loddigesi, Cypripedium insigne, Dendrobium chrysanthum, D. Jenkinsi, D. moschatum, D. nobile, D. Pierardi, D. pulchellum, Epidendrum aurantiacum, E. ciliare, Lælia autumnalis, Lycaste cruenta, L. Skinneri, Maxillaria Harrisoni, M. picta, Oncidium altissimum, O. Cebolleti, O. flexuosum, O. leucochilum, O. macropterum, Phaius albus, P. grandifolius, Rodriguezia planifolia, Stanhopea insignis major, S. oculata, S. tigrina major.

T. J. & SON, having a fine Stock of healthy plants of good Orchids suited for amateurs commencing a collection, will be glad to furnish 12 distinct kinds from the above, selected by T. J. & Son, for 42s.; 12 selected from the above by the purchaser, 63s. Many of the more rare Orchids at equally low prices.

Kingston, near London.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21s.

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gaufred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes Each 21s.

PATTERSON'S SCARLET NONPAREIL STRAWBERRY.

JAMES VEITCH, JUN., has the pleasure to inform the public that Mr. Patterson, Gardener to Baroness Wenman, of Thame Park, Oxon, has placed in his hands for distribution the stock of the above first-rate Seedling Strawberry, which, having been fully tested and exhibited, has proved to be of very superior excellence.

It was exhibited at Chiswick, on Saturday last, June 3, and received the Silver Knightian Medal; it has also been submitted to Dr. Lindley, Mr. Marnock, and Mr. Thompson, all of whom report most favourably of its merits.

It is a *first-class forcing* Strawberry in character, intermediate between *its parents—Keens' Seedling* and *British Queen;* of the vigorous habit of the *former*, and fully one week earlier in ripening; and in the quality of its fruit *fully equal* in flavour, it not superior, to the latter. The fruit is of a large size and handsome shape, of a *bright red colour*, and with a remarkably high perfume.

Orders are now taking for strong plants to be sent out the first week in September on the following terms:—

100 Plants ... £3 | 50 Plants ... £2 | 12 Plants ... 12s.

Exotic Nursery, Chelsea.—June 10.

GERANIUMS.—Large Surplus Stock of Choice Varieties. Any of the following 9s. per dozen, or the set of 24 for 16s.; strong for immediate flowering.—Alderman, Beauty of Montpelier, Belle of the Village, Centurion, Crusader, Conspicuum, Commissioner, Elegans, Emily, Falstaff, Field Marshal, Generalissimo, Gulielma, Gustavus, Herald, Norah, Magnificent, Nandee, Prince of Orange, Pearl, Rosa, Star, Tyrian Queen, Virgin Queen, Windsor Castle.

FANCY VARIETIES.—Any of the following, 9s. per dozen, or the set of 20 for 14s.—Beauty of Winchester, Delicata, Electra, Exquisite, Fairy Queen, Jehu Improved, Jenny Lind, Le Belle de Africana, Lady F. Hastings, Maid of Anjou, Maguifica, Mazeppa Superb, Marian, Ne Plus Ultra, Odorata Superba, Prince Albert, Reine de Fleurs, Stafiaski, Village Maid, Zelia.

BASS AND BROWN,
Seed and Horticultural Establishment, Sudbury, Suffolk.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITION AT THE GARDEN, JUNE 3, 1854.

AWARD OF THE JUDGES.

THE FIRST LARGE GOLD MEDAL.

1. To Mr. Green, Gardener to Sir E Antrobus, Bart., F.H.S., for a collection of 20 Stove and Greenhouse Plants.
2. To Mr. Williams, Gardener to C. B. Warner, Esq., F.H.S., for 20 species of Exotic Orchids.

THE SECOND LARGE GOLD MEDAL.

1. To Mr. Dods, Gardener to Sir J Cathcart, Bart., F.H.S., for a collection of 20 Stove and Greenhouse Plants.
2. To Mr. Woolley, Gardener to H. B. Ker, Esq., of Cheshunt, for 20 species of Exotic Orchids.

THE FIRST GOLD KNIGHTIAN MEDAL.

1. To Mr. Barter, Gardener to G. Bassett, Esq., of Stamford Hill, for a collection of 20 Stove and Greenhouse Plants.
2. To Mr. Carson, Gardener to W. F. G. Farmer, Esq., F.H.S., for a collection of 15 Stove and Greenhouse Plants.

THE SECOND GOLD KNIGHTIAN MEDAL.

1. To Messrs. Fraser, of Lea Bridge Road, for a collection of 20 Stove and Greenhouse Plants.
2. To Mr. Gilham, Gardener to J. R. Scott, Esq., of Leyton, for a collection of 15 Stove and Greenhouse Plants.

THE FIRST GOLD BANKSIAN MEDAL.

1. To Mr. Clarke, Gardener to Mrs. Webb, of Hoddesdon, for 10 species of Exotic Orchids.
2. To Messrs Veitch, F.H.S., for 15 species of Exotic Orchids.
3. To Mr. Speed, of Edmonton, for a collection of 15 Stove and Greenhouse Plants.
4. To Mr. Over, Gardener to W. McMullen, Esq., of Clapham, for a collection of 6 Stove and Greenhouse Plants.
5. To Messrs. Lane, of Great Berkhampstead, for 12 varieties of Roses in pots.
6. To Messrs. Rollisson, of Tooting, for 10 varieties of Cape Heaths.
7. To Mr. C. Turner, F.H.S., for a collection of 12 Pelargoniums.
8. To Mr. Fleming, Gardener to the Duke of Sutherland, F.H.S., for a collection of Fruit.
9. To A. Rowland, Esq., F.H.S., for 12 varieties of Roses in pots.

THE SECOND GOLD BANKSIAN MEDAL.

1. To Mr. Carson, Gardener to W. F. G. Farmer, Esq., F.H.S., for 10 species of Exotic Orchids.
2. To Messrs. Rollisson, of Tooting, for 15 species of Exotic Orchids.
3. To Mr. Peed, Gardener to T. Tredwell, Esq., of St. John's Lodge, Norwood, for a collection of 6 Stove and Greenhouse Plants.
4. To Mr. Francis, F.H.S., for 12 varieties of Roses, in pots.
5. To Mr. Peed, Gardener to T. Tredwell, Esq., for 10 varieties of Cape Heaths.
6. To Mr. Dobson, of Woodlands Nursery, Isleworth, for twelve Pelargoniums, in 8-inch pots.
7. To Mr. Tegg, Gardener to A. Pryor, Esq., F.H.S., for a collection of Fruit.

THE SILVER GILT MEDAL.

1. To Mr. Dods, Gardener to Sir J. Cathcart, Bart., F.H.S., for 10 species of Exotic Orchids.
2. To Mr. Rhodes, Gardener to Sir J. Phillpott, Esq., of Stamford Hill, for a collection of 15 Stove and Greenhouse Plants.
3. To Mr. Taylor, Gardener to J. Coster, Esq., of Streatham, for 6 Stove and Greenhouse Plants in 13-inch pots.
4. To Messrs. Rollisson, of Tooting, for Uropedium Lindeni.
5. To Messrs. Fraser, of the Lea Bridge Road, for 10 varieties of Cape Heaths.
6. To Mr. Jarvis, Gardener to J. Ruck, Esq., of Croydon, for 6 varieties of Greenhouse Azaleas.
7. To Messrs. Veitch, F.H.S., for a collection of Variegated Plants.
8. To Mr. Mockett, Gardener to J. Allnutt, Esq., F.H.S., for a collection of 12 Pelargoniums in 8-inch pots.
9. To Mr. Patterson, of Thame, for a collection of Fruit.
10. To Mr. Frost, Gardener to E. L. Betts, Esq., F.H.S., for Black Hamburgh Grapes.

THE LARGE SILVER MEDAL.

1. To Mr. Green, Gardener to Sir E. Antrobus, Bart., F.H.S., for 10 species of Exotic Orchids.
2. To Mr. Hamp, Gardener to J. Thorne, Esq., of South Lambeth, for 15 Stove and Greenhouse Plants.
3. To Messrs. Pamplin, of Leyton, for 6 Stove and Green house Plants.
4. To Mr. Green, Gardener to Sir E. Antrobus, Bart., F.H.S., for 6 varieties of Tall Cacti.
5. To Messrs Henderson, of Pine-apple Place, for Hoya sp.
6. To Messrs. Veitch, F.H.S., for Nepenthes lanata.
7. To Mr. Taylor, Gardener to J. Coster, Esq., of Streatham, for 6 varieties of Cape Heaths.
8. To Mr. Taylor, Gardener to J. Coster, Esq., of Streatham, for 6 Greenhouse Azaleas.
9. To Messrs. Rollisson, of Tooting, for a collection of Variegated Plants.
10. To Messrs. Rollisson, of Tooting, for a collection of Tender Plants of fine foliage.
11. To Mr. Gaines, F.H.S., for a collection of Pelargoniums.
12. To Mr. C. Turner, F.H.S., for 6 Fancy Pelargoniums.
13. To Mr. Clements, of East Barnet, for a collection of Fruit.
14. To Mr. Hill, Gardener to R. Sneyd, Esq., F.H.S., for a collection of Fruit.
15. To Mr. Lushey, Gardener to J. Hill, Esq., of Streatham, for Black Hamburgh and Black Prince Grapes.
16. To Mr. Turnbull, Gardener to the Duke of Marlborough, for a Providence Pine-apple, weighing 8 lbs. 11½ oz.

THE SILVER KNIGHTIAN MEDAL.

1. To Mr. Summerfield, Gardener to J. S. Venn, Esq., of Highbury Park, Islington, for 10 species of Exotic Orchids.
2. To Mr. Roser, Gardener to J. Bradbury, Esq., F.H.S., for a collection of 6 Stove and Greenhouse Plants.
3. To Messrs. Fraser, of Lea Bridge Road, for 6 Helichrysums.
4. To Mr. Gilham, Gardener to J. R. Scott, Esq., of Leyton, for 6 varieties of Tall Cacti.
5. To Messrs. Veitch, for Leptosiphon aureum.
6. To Mr. Roser, Gardener to J. Bradbury, Esq., F.H.S., for 6 varieties of Cape Heaths.
7. To Mr. Gaines, F.H.S., for 6 Fancy Pelargoniums.
8. To the same, for 6 French Pelargoniums.
9. To Mr. Ivison, Gardener to the Duke of Northumberland, F.H.S., for Grapes in pots.
10. To Mr. Turnbull, Gardener to the Duke of Marlborough, for Muscat Grapes.
11. To Messrs. Mitchell, of Brighton, for Black Hamburgh Grapes.
12. To Mr. Martin, Gardener to Sir H. Fleetwood, Bart., F.H.S., for Black Prince and Black Frontignan Grapes.
13. To Mr. Chapman, Gardener to J. B. Glegg, Esq., for a Providence Pine-apple, weighing 8 lbs. 5 oz.
14. To Mr. Robinson, Gardener to the Lord Boston, F.H.S., for Providence Pine-apples.
15. To Mr. Smith, of Twickenham, for British Queen and Keens' Seedling Strawberries.

THE SILVER BANKSIAN MEDAL.

1. To Mr. Jarvis, Gardener to J. Ruck, Esq., of Croydon, for 10 species of Exotic Orchids.
2. To Mr. Over, Gardener to W. McMullen, Esq., of Clapham, for a collection of 6 Stove and Greenhouse Plants.
3. To Mr. Taylor, Gardener to J. Coster, Esq., of Streatham, for 6 Helichrysums.
4. To Messrs. Rollisson, of Tooting, for Nidularia fulgens.
5. To Mr. Over, Gardener to W. McMullen, Esq., of Clapham, for 6 varieties of Cape Heaths.
6. To Messrs. Henderson, of St. John's Wood, for 6 Fancy Pelargoniums.
7. To Mr. Stanley, Gardener to J. J. Blandy, Esq., F.H.S., for Sweetwater Grapes.
8. To Mr. Dods, Gardener to Sir J. Cathcart, Bart., F.H.S., for Black Hamburgh Grapes.
9. To Mr. A. Taylor, Gardener to H. Ingram, Esq., of Temple Newsam, near Leeds, for a Black Prince Pine Apple, weighing 6 lbs 13 oz.
10. To Mr. Ferguson, F.H.S., for May Duke Cherries, grown under glass without fire heat.
11. To Mr. Baily, Gardener to G. G. Harcourt, Esq., F.H.S., for Brown Turkey Figs.
12. To Mr. Sparrow, Gardener to Lord Robert Grosvenor, Moor Park, Herts, for Elruge Nectarines.
13. To Mr. Constantine, Gardener to C. Mills, Esq., of Hillingdon, for a collection of Strawberries.
14. To Mr. Patterson, of Thame Park Gardens, for his Scarlet Nonpareil Strawberry.
15. To Mr. Fleming, Gardener to the Duke of Sutherland, F.H.S., for a Cashmere Melon.
16. To Messrs. Lane, of Great Berkhampstead, for Cherries grown in pots.

THE FIRST CERTIFICATE.

1. To Mr. Jarvis, Gardener to S. Ruck, Esq., of Croydon, for a collection of 6 Stove and Greenhouse Plants.
2. To Messrs. Rollisson, of Tooting, for Gaultheria pulchra.
3. To Mr. Gaines, F.H.S., for Azalea roseo-alba.
4. To Mr. Roser, Gardener to J. Bradbury, Esq., F.H.S., for 6 varieties of Greenhouse Azaleas.
5. To Mr. Judd, Gardener to Earl Spencer, F.H.S., for Brown Ischia Figs.
6. To Mr. Toy, Gardener to W. Lyon, Esq., of Chiselhurst, for British Queen Strawberries.
7. To Mr. Young, Gardener to Lord Barrington Beckett, Berks, for a Bromham Hall Melon.
8. To Mr. Carpenter, Gardener to Sir F. Scott, Bart., of Great Barr Hall, Staffordshire, for a Trentham Hybrid Melon.

THE SECOND CERTIFICATE.

1. To Messrs. Veitch, F.H.S., for Rhododendron catawbiense album grandiflorum.
2. To Mr Constantine, Gardener to C. Mills, Esq., of Hillingdon, for Nerii Figs.
3. To Mr. Munro, Gardener to the Earl of Clarendon, for two Hybrid Melons.

SPLENDID NEW HYBRID FUCHSIA.
"FUCHSIA DOMINIANA."

MESSRS. VEITCH & SON, of Exeter and Chelsea, can now supply good well-established plants of this really fine Fuchsia. Price 10s. 6d. each, with one over when three are taken. The merit of raising this beautiful plant is due to Mr. Dominy, the Foreman of the Plant Department at the Exeter Nursery; it consequently bears his name as a memento of his zeal and ability in the performance of his duties. It is a seedling between Serratifolia multiflora and spectabilis, having the fine free growth of the former and the splendid flowers of the latter.

It was exhibited at the National Floricultural Society's Meeting, October 6, 1853, and had a Certificate of Merit awarded it. It was also exhibited at the London Horticultural Society's Meeting, on the 18th of the same month, and was again similarly rewarded.—Exeter and Chelsea Nurseries, June 10.

NEW FANCY PELARGONIUMS.

WM. BARNES, Camden Nursery, Camberwell, begs to announce to his Friends and the Public, that he has purchased the Stock of the following first-rate Fancy Pelargoniums from Mr. W. P. Ayres, and being such as Mr. Ayres has proved to be improvements upon existing varieties, W. B. has much pleasure in recommending them to his friends.

*** The usual discount to the trade.

BOUQUET PARFAIT (Ayres).—A perfect bouquet, of dwarf and very compact habit, and a most profuse bloomer. Colour soft bright rosy lilac, with white centre, and distinct margin of clean white. Height, 12 to 18 inches; size medium; form exquisite. 21s.

CRAMOISIE SUPERIEURE (Ayres).—A Cape cross, with deeply laciniated foliage, of a very distinct character. Colour brilliant scarlet crimson of most intense cast; lower petals a little lighter. Habit dwarf and compact; size medium; form very good. A very distinct variety. 15s.

DIADEM (Ayres).—A light variety of very desirable quality. Habit dwarf, compact, and of very free growth. Colour, upper petals rich purplish plum, with broad margin of white; lower petals white, slightly pencilled; size large; form excellent. 21s.

EUPHROSINE (Ayres).—An improvement upon Beauty of Blackheath, and of free and robust growth. Colour, upper petals soft rosy crimson margined with white; lower petals white, distinctly spotted with crimson; size medium, form excellent; 21s.

KATHLEEN MAVOURNEEN (Ayres).—It is sufficient to say this is an improvement upon Formosissimum (one of the only two fancy Geraniums which ever took a first-class prize as a seedling). Colour, scarlet crimson, slightly pencilled with lilac in the upper petals; lower petals a broad belt of the same colour and distinctly margined with clear white. Size large, form first-rate. An excellent grower. 21s.

VICTRIX (Ayres).—This is considered by Mr. Turner and equally competent judges as an improvement upon Celestial, and it has certainly the most perfect lower petal of any Geranium in cultivation, but is a little deficient in the top petals. Colour, soft lilac rose; size, extra large; habit, free and strong; form, nearly perfect. 21s.

W. B. would beg to observe that strong plants of the above are now ready for delivery, and most of the kinds may be seen in bloom at his nursery.—Camberwell, June 10.

ARTHUR HENDERSON AND CO. take the earliest opportunity of informing their friends and the public, that their CATALOGUES No. 3 and No. 6 are now ready and can be had, post free, upon application.

No. 3 contains descriptive lists of Geraniums, Verbenas, Fuchsias, Calceolarias, Cinerarias, Chrysanthemums, &c., amongst which will be found all the best novelties of the season, also the choicest selections from former years.

No. 6 contains descriptive lists of all the newest and best Stove, Greenhouse, and Hardy plants, amongst which will be found many new and desirable plants.

The following new plants are now on sale:

SEEDLING GLOXINIAS.

ELEANOR.—Ground colour pure white, blotched with rose, and shaded with purple.

ELEGANTISSIMA.—Ground colour French white, of great substance, centre pale lavender, spotted with buff.

EUGENIE.—Ground colour rosy pink, centre creamy white, spotted with rose.

EXQUISITE—Ground colour pure white, with broad belt of puce, throat creamy white, spotted with puce.

MAGNET.—Ground colour clear rose, with blotch of purple in the throat, flowers large, of fine form.

PRINCE OF WALES.—Ground colour white, shading off to lavender.

SIR C. NAPIER.—Ground colour deep rosy crimson, throat blotched with intense rose, dwarf habit.

The above seven Gloxinias will all be found to be fine varieties, with large well-formed flowers standing well up above the foliage. 7s. 6d. each, or 42s. the set.

CINERARIA EVA.—Ground colour pure white, with narrow margin of purple, dark disc, fine form and substance; received a Certificate at the National Floricultural Society. 10s. 6d.

GERANIUMS.

DIADEMATUM REGINA.—Ground colour deep shining rose, upper petals veined with dark purple and white, with blotch of bright orange crimson; very dwarf habit, and abundant bloomer; a fine variety for bedding. 7s. 6d.

DIADEMATUM SIDONIUM MULTIFLORUM.—Lower petals rosy purple, shaded with crimson; upper petals orange crimson, veined with dark maroon; trusses large, habit dwarf and compact, abundant bloomer; a fine variety for bedding. 10s. 6d.

PRINCESS.—Ground colour blush white, veined and shaded with carmine, dark horse-shoe foliage, large globular-shaped trusses, and most abundant bloomer. 7s. 6d.

CETERACH MARANTA (syn. Nothoclena maranta).—A new hardy Fern from the Alps of Switzerland; fronds bipinnate, about 8 inches in length, densely coated with golden brown scales on the under side. 15s.

Pine-apple Place, London, June 10.

TO AMATEUR FLORISTS, GARDENERS, ETC.

H. COLES & CO. beg to inform Floriculturists, &c., that their celebrated POT MANURE, which has given general satisfaction for so many years, may be obtained of all the principal Seedsmen and Druggists in town and country, in packages, at 20s., 10s., 5s., 2s 6d., 1s., and 6d. each. For Amateur, Rose, Fuchsia, and Chrysanthemum Growers, it will be found one of the best Fertilisers yet introduced; also their CONCENTRATED ANIMAL MANURE, prepared by a different process for Agricultural purposes, at 6l. 10s. per ton, which will be found infinitely superior to many other Artificial Manures.

Depôt, Albert Wharf, 10, Wilton Road, Pimlico.

BETHAM & BLACKITH, GENERAL TRANSIT AGENTS, according to annual custom, as the season is approaching for the importation of Dutch Bulbs and Plants, again have the pleasure of offering their services, and of assuring their friends that all packages consigned to their care will be forwarded to their destination without delay, and at very moderate charges.

Agents:—in Rotterdam, Mr. J. A. HOUWENS; Ostend, Messrs. R. ST. AMOUR et fils; New York, Mr. G. G. SHEPPARD, 187, Water Street.

Cox's Quay, Lower Thames Street, London, June 10.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application

NEW AND BEAUTIFUL PLANTS.

MESSRS. VEITCH & SON,

OF EXETER, AND THE EXOTIC NURSERY, CHELSEA,

HAVE much pleasure and confidence in offering the following novelties. Never, perhaps, have they had the opportunity of presenting at one time so many really VALUABLE and STERLING PLANTS as they do on this occasion, believing them all to be Plants that will give general satisfaction, and tend to increase that confidence and support which have so long and so liberally been bestowed upon them.

The Plants are well established; and all Orders will be executed in the rotation in which they are received.

WELLINGTONIA GIGANTEA.

Ample description of this noble tree having lately appeared in the *Gardeners' Chronicle*, the *Times*, the *Illustrated London News*, Curtis's *Botanical Magazine*, the *Florist*, and other publications, it is only necessary now to say that it is a perfectly hardy Coniferous tree, of immense dimensions and great beauty.

Fine established seedling plants are now ready to send out on the following terms:—

One plant, 2 guineas	Eight plants, 10 guineas
Four do., 6 „	Twelve do., 12 „

DESFONTAINIA SPINOSA.

A fine hardy evergreen flowering shrub, with glossy Holly-like foliage, introduced from the Andes of Patagonia by Mr. W. Lobb, *who discovered it in the region of snow.*

It produces beautiful tubular-shaped blossoms, often 2 inches in length, and of a rich scarlet colour tipped with yellow. (See figure in Curtis's Bot. Magazine for May, 1854.)

This plant having been fully exposed in the open ground during the three last winters may, consequently, be declared to *be perfectly hardy.*

It will certainly be a great acquisition.

Fine established plants, in three sizes, 21*s.*, 42*s.*, and 63*s.* each.

One over on three to the trade.

CERATOSTEMA LONGIFLORUM.

(Fig. in Curtis's Bot. Mag. for April, 1854.)

A beautiful dwarf evergreen Greenhouse Shrub, introduced through Mr. W. Lobb, from the Andes of Peru.

It bears bunches of large tubular-shaped flowers, of a rich orange scarlet colour, of a stout waxy texture, and which are of great duration.

It was exhibited at Chiswick in July 1853, and obtained the first prize for new and rare plants.

Good established plants, of two sizes, 21*s.* and 31*s.* 6*d.* each.

One over on three to the trade.

LOMATIA FERRUGINEA.

This fine Evergreen Shrub was found in Chiloe and Patagonia by Mr. W. Lobb.

It attains a height of from 6 to 8 feet, and is remarkable for its beautiful Fern-like foliage.

As a fine leaved Conservatory Plant it is perhaps without a rival, and no collection of fine foliaged plants should be without it.

It has but to be seen to be admired.

Fine established plants of two sizes, 31*s.* 6*d.* and 42*s.* each.

One over on three to the trade.

EUGENIA, OR MYRTUS UGNI.

(Figured in Curtis's "Botanical Magazine" for Jan., 1852.)

This very interesting evergreen flowering shrub was obtained from Patagonia through Mr. W. Lobb.

It has stood several winters in the open ground without shelter, producing its delightfully fragrant flowers in July, succeeded by Strawberry-flavoured berries, eaten in Chili as dessert.

It is a plant of easy culture, and blooming freely in a small state, is well adapted for growing in pots.

Strong blooming plants in 48-sized pots, 21*s.* each.
Second-sized do., in 60-sized pots, 15*s.* each.
One over on three to the trade.

IMPATIENS JERDONIÆ.

This beautiful new Balsam is figured in "The Florist" of January last, and is certainly one of the most interesting of recent introductions.

It is of a dwarf neat habit, of easy cultivation, requiring the temperature of a warm greenhouse or stove, and an abundant bloomer, continuing in flower at least three months.

The flowers are in colour bright red and yellow. It was exhibited in the Hort. Soc. rooms, 21, Regent Street, on the 18th October last, and had the highest prize for new plants awarded.

This is a lovely little plant.

Fine Established Plants ... ... 10*s.* 6*d.* each.
A few extra-sized do. ... ... 21*s.* „
One over on three to the trade.

HEXACENTRIS LUTEA.

A fine Stove Climber, introduced from the Neilgherry Hills, of easy culture, and great beauty.

It produces its flowers in abundance, on elegant pendulous racemes, of from 15 to 18 inches in length, of a clear bright yellow, unmixed with any other colour.

The effect produced when seen drooping from the roof of the conservatory or a trellis is most striking.

It was exhibited at Chiswick on the 13th May last, and obtained the Silver Banksian Medal.

Strong Established Plants ... ... 21*s.* 0*d.* each.
Second sized „ ... ... 10*s.* 6*d.* „
One over on three to the Trade.

VERONICA VARIEGATA.

This lovely hybrid Veronica was raised by J. Anderson, Esq., of Maryfield, Edinburgh, between V. Andersoni and V. salicifolia.

In character it is intermediate between the two parents, having a bushy compact habit, and small glossy foliage.

It is an abundant bloomer.

The racemes of flowers on first appearing are a clear bright pink, and gradually shade off to a pure white, producing a very pretty and striking effect.

It is really a most useful and attractive plant.

It was exhibited at Chiswick in July, 1853, and was awarded a Medal and greatly admired.

Fine bushy plants, 10*s.* 6*d.* each. Three for 21*s.*, to the Trade.

AZALEA INDICA.

Striata formosissima (Taylor).

This beautiful new Azalea is now offered for the first time. It is a seedling raised by Mr. Taylor, gardener to J. Coster, Esq., of Streatham. It is a pure white, flaked and spotted with light purple, fine form, good substance, and first-rate habit.

It was exhibited at the National Floricultural Society, on the 16th June, 1853, and received a Certificate of Merit.

It was also exhibited at the June exhibitions of the Royal Botanical Society, Regent's Park, and the Horticultural Society, at Chiswick, on both which occasions it received prizes.

Worked plants are now ready at 21*s.* each. One over on three to the Trade.

MESSRS. VEITCH & SON can also supply the following good and popular Plants:—

Abies bracteata (seedlings)... ... ... 63*s.* each.	Hoya fraterna ... ... 10*s.* 6*d.* to 21*s.* each.
Aphelandra Leopoldi ... ... 21*s.* „	Ixora Lobbi ... ... 10*s.* 6*d.* to 21*s.* „
Azalea indica, Beauté de l'Europe ... 3*s.* 6*d.* to 21*s.* each.	Lilium giganteum ... ... 21*s.*, 42*s.*, 63*s.* „

LIST OF PRESENT PRICES FOR CHOICE FRUITS

FORWARDED POST FREE.—Apply to
GEORGE TAYLOR, JUN.,
FRUIT SALESMAN,
St. John's Market,
Liverpool,

Purchaser and Contractor for Choice Produce. Payment nett cash on receipt of goods.

BEDDING PLANTS, &c.—ALL IN POTS, STRONG AND FINE.

The price per 100 for quantities not less than 50.

100 Verbenas, in 30 choice vars., 24*s.*; 3*s.* 6*d.* per doz.
20 „ of 20 best new vars. of 1853, 20*s.*
100 Petunias, in 25 choice vars., 28*s.*; 4*s.* per doz.
10 „ of 10 best new vars. 1853, 10*s.*
100 Fuchsias, in 50 choice vars., 32*s.*; 4*s.* to 6*s.* per doz.
15 „ of 15 best new vars. of 1853, 25*s.*
100 Anagallis, best blue and scarlet, 2 vars., 28*s.*; 4*s.* per doz.
100 Heliotropes, 28*s.*; 4*s.* per dozen.
100 „ in 8 fine vars., 40*s.*; 6*s.* per doz.
100 Chrysanthemums, in 100 choice vars., of large flowering and Pompone sorts, 5*s.* to 7*s.* 6*d.* per doz.
10 „ best new large-flowering vars. of 1853, 10*s.*
21 „ best new Pompone vars. of 1853, 20*s.*; 12 for 12*s.*
100 Dahlias, in 50 choice show vars., 35*s.*; 5*s.* to 9*s.* per doz.
100 „ in 30 choice fancy vars., 35*s.*; 5*s.* to 9*s.* per doz.
12 „ best new show vars. of 1853, 21*s.*
10 „ best new fancy of 1853, 18*s.*
100 Herbaceous Plants, in 100 fine and showy vars., 30*s.*
10 „ in 10 ditto, including new vars., 50*s.*
25 Rock Plants, in 25 fine vars., 12*s.*
24 Dwarf Rock Cistus, in 24 splendid vars., 15*s.*
50 Phlox, in 50 choice hardy vars., 25*s.*; 6*s.* to 9*s.* per doz.
6 „ of 6 fine new vars. of 1853, 12*s.*
24 Geraniums, in 24 choice show vars., 16*s.*; 12 for 9*s.*
30 „ in 30 choice newer vars., 45*s.*; 12 for 18*s.*
12 „ of 12 best new of last season, 44*s.*
20 „ FANCY, in 20 choice vars., 14*s.*; 12 for 9*s.*
12 „ „ in 12 choice newer vars., 18*s.*
6 „ „ of best new of last season, 18*s.*

Extensive Collections of Stove and Greenhouse Plants. Complete Catalogues free by post for 6 penny stamps.

☞ GOODS CARRIAGE FREE (not under 20*s.*) to all the London termini, and all stations on the London and Norwich and Colchester Line. Plants added gratis with orders 40*s.* and upwards.

BASS & BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

THOMAS PERKINS, Horticultural Buildings, Atherstone, Warwickshire, has for sale BEDDING PLANTS at 1*s.* per dozen:—GERANIUMS, Scarlet, of sorts; ditto, Horse-shoe-leaved; ditto, Manglesi. HELIOTROPES, of sorts, with many other Bedding Plants.

The Gardeners' Chronicle.

SATURDAY, JUNE 10, 1854.

WHEN foreigners look at the great exhibitions of the HORTICULTURAL SOCIETY, one invariable question now is, "Where are your bad growers?" It surprises them to find that perfect cultivation, which is the exception with them, is the universal rule here; and we trust that they return to their native country with a salutary distaste for the sticks and leaves and dreary flowers which make up many a continental *exposition*. How this has been brought about among ourselves it is needless to enquire. That sturdy determination to overcome obstacles which is the happiest part of our national character, and which carries us safely through the shoals of a strange social and political system, is no doubt at the bottom of our success in gardening. But we may be permitted to add that the determination has been elicited by the steady perseverance of the Fellows of the Horticultural Society to reward merit wherever it could be found. For the last 40 years their funds, their knowledge, and their influence have been unremittingly directed to that great object; all the available talent of the country has been called in aid; engineers, architects, chemists, geologists, botanists, physiologists, natural philosophers, have each contributed their share, and the grand result is that of which a sample may be seen on any of the three great annual exhibitions at Chiswick. Were the Horticultural Society to be suddenly swallowed up in some great catastrophe of nature, it would have left behind it traces which no time will obliterate. Other institutions of recent existence are doubtless contributing their help, but they only came into the field when the great work was well nigh accomplished.

The report of last Saturday's meeting, to be found in another column, entirely justifies all that is now asserted. The old experienced gardeners who have been present at these meetings from the beginning, will feel the justice of our observations; for they must look back with wonder from what plants are to what they were. Not that there was much novelty—nor would that have any bearing upon our case; for we speak of good management, not of fortunate importations. It would have been a novelty, indeed, had the plants been badly grown, but of that small risk exists. Those who are now incapable of managing plants well are too wise to display their defects in public.

Where all was good it is difficult, if not invidious, to single out particular cases for comment. We therefore abstain from criticism, and limit ourselves to the remark that fruit was displayed in most admirable condition and in abundance. So evident, indeed, is it that this part of the exhibition is rising rapidly, under the new regulations, into an importance before unknown, that we cannot but contemplate the possibility of more accommodation being required, and a greater extension being given to the system. On Saturday, one-third of all the medals awarded were granted for fruit, two of which were gold, of the respective values of 7*l.* and 5*l.* each, and were admirably won by Mr. FLEMING, gardener to the Duke of SUTHERLAND, and Mr. TEGG, gardener to Mr. ARTHUR PRYOR, of Wandsworth. The only new varieties that attracted our attention were a Cashmere Melon from Trentham, of singular excellence, and a beautiful new Strawberry, called the Scarlet Nonpareil, as good as it was handsome, produced by Mr. PATTERSON, between KEENS' Seedling and the British Queen. Unlike the ruddy Sir CHARLES NAPIER, shown in May, and found upon trial to be worthless, it received the universal commendation of all who tasted it. We may take this opportunity of expressing our surprise that a respectable fruiterer should have permitted the dish of tasteless fruit bearing the name of Sir CHARLES NAPIER, actually scouted by the judges last May, to be placed in his window, with a card upon them, declaring that they had received a medal.

The next meeting of the Society, on the 8th of July, will, no doubt, present a still more imposing display of fruit, and will, we trust, be held on a warmer day than June 3d, which reminded visitors of March rather than of Midsummer.

SOME years ago the ROYAL GARDENS had fallen into a state of helpless inutility. The forcing and kitchen gardens were a dead weight upon the Lord Steward's department; half-a-dozen of them, maintained at vast cost, were unable to supply the Royal table so well as that of a country gentleman is supplied; and had it not been for Covent Garden, KING WILLIAM must have been sometimes contented with Potatoes and Cabbages for dinner and supplies of grocery for dessert. As to the Royal Botanic Garden at Kew, it was so secluded from the public eye that no impertinent visitor was likely to expose its miserable plight to a ruthless press. The Royal Gardens were so many snuggeries in which a man might slumber away his life without the risk of troublesome questions. Their present parallel is to be found in the Royal Forests.

At last matters become so bad that enquiry was unavoidable. High officers of state became disgusted, and it was resolved to ascertain why the Sovereign of England should not be at least as well supplied as her subjects. The enquiry was not delegated to a Parliamentary Committee, but to three persons, whose practical knowledge could not be questioned, and whose character placed them beyond influence, either from above or below. The gentlemen entrusted with this duty were instructed to inspect the establishments in the presence of the gardeners in charge; they were furnished with ample evidence as to what the gardens had supplied for several previous years; and they received power to examine minutely, in any manner they thought necessary, into every detail relating to past management. They made their report, and their recommendations were carried into execution.

We shall not say what their report was. It is enough to state that in the kitchen and forcing department one active excellent gardener was selected from those in the Royal service to manage a new establishment, expressly created in lieu of the old and worn-out places ordered to be abolished; and that in the Royal Botanic Garden at Kew the Director was relieved from his charge. The result is seen at Frogmore, one of the best managed and

most productive gardens in Europe; and at Kew, which has become by far the most important and popular scientific establishment of its kind in the world.

We have before us Sir WM. HOOKER's last report on Kew Gardens, dated April 5, 1854. It tells us that the visitors have increased from 9174 in 1841 (he might have said from 0, or some undiscoverable number in 1831) to 331,210 in 1853; and he points with just pride to the Museum there, almost the work of his own hands, compared with which the botanical part of the British Museum is contemptible. "In less than seven years from its foundation a collection is formed, at almost no expense to the country, mainly from donations, such as no other country possesses, and such, we may truly say, as no other country has attempted to form, notwithstanding its manifest advantages to a great commercial nation." The Director also announces the donation to the Museum of the Books and Herbarium of the late Dr. BROMFIELD, and the far more important collection formed by Mr. BENTHAM, a noble gift, for it is the second herbarium in this country, and one of the finest in existence. Such are among the early results of a system of management of which all must approve; and at what cost is this effected? It will be found from the Estimates that all which Kew asks for this year is 11,000*l.*, less than two-thirds of what the St. James's, Green, and Hyde Parks require. And this, we presume, includes the cost of Botanical lectures, which it is in the contemplation of the chief commissioner to have delivered during the summer.

Lectures explanatory of the application to practical purposes of the vast riches gathered together at Kew, were all that remained to render the establishment a perfect machine for public instruction. If, as we take for granted, these are to be entrusted to Dr. HOOKER, we know enough to be certain that they will not only add much to the value and popularity of Kew Gardens, but greatly raise the establishment in the eyes of the scientific world.

Such is a rapid sketch of the result of a fair inquiry into notorious abuses, when entrusted to independent, resolute, and competent men. Might not similar advantages be derived from such an examination into the Royal Forests?

Among the estimates in the paper before us are the following, which relate to gardens or parks, viz.:

Royal Botanical Gardens, Edinburgh, for the cost of enlarging the present Palm House ...	£6000
Kensington Gardens	2280
Regent's Park	6248
Victoria Park	3369
Kennington Common	753
Richmond Park	5246
Bushy ditto	1967
Hampton Court ditto	4125
Holyrood ditto	871
Phœnix ditto	4507

WE had the pleasure lately of inspecting a very beautiful series of drawings by Mr. FORRESTER, the author of the OLIVEIRA prize essay on Portugal, illustrative of the present state of the Vine, with a view to show whether the plants themselves were deeply affected by the disease, or whether there is reason to believe that the malady is external. As far as the drawings go, and such specimens as we have seen—for we have not had an opportunity of inspecting all the materials—there is not the least reason to believe that the stocks are diseased to such an extent as to make the endurance of the vineyards themselves precarious. In a few cases only the ducts were filled with brown matter so characteristic of phænogams attacked by fungi, but in every such case the evil was distinctly traceable to some old wound, and not to any general depraved state of the plant. In every case the roots were perfectly healthy and in a normal condition.

One or two points connected with the Grape mildew are remarkable, as observed by Mr. FORRESTER, to whom we are indebted for the information. The first is the comparatively large number of seeds which come to perfection in the diseased Grapes. Where one or two only are found in healthy Grapes, as many as five occur in the very same variety where they are diseased. It is scarcely probable that more ovules are impregnated in the one case than in the other; it is more likely that in healthy berries some of the seeds become abortive in consequence of the greater comparative development of the pulp. The increased number of seeds will of course have a tendency to reduce the produce.

Another peculiarity is that the produce is, in equal measures, deficient in body and strength, a consequence perhaps the less surprising when it is considered that the parasite lives at the expense of the sap at the very point where it undergoes those modifications which are most essential for the due perfection of every part of the plant.

A fourth peculiarity is the small deposit of argol or crude tartar, which during fermentation forms a white or red crust on the sides of the casks. As this is bought up greedily by agents from Liverpool, the deficiency was in some cases fraudulently supplied by an artificial imitation, which was the more deceptive because it was dried on old staves, that it might have the proper curved form of the true argol.

What, however, is far more startling is, that though the wines are deficient in strength and body, they are far more forward than those of ordinary growth. It is well known, indeed, that the phenomena of fermentation are connected in great measure with the development of fungi, and it is very curious to find this singular precocity equally connected with their presence, and this, not as regards any especial readiness, so far as we have learnt, to enter into a state of fermentation in the first instance, but with reference to that less palpable but continuous fermentation by which wines attain their full maturity.

We trust that Mr. FORRESTER will continue his curious and active researches, for much remains to be discovered in these matters, and it is from persons on the spot, who have facilities for entering into numerous vineyards and examining even the most favourite Vines, which others would not be allowed to disturb, and who at the same time have powers of observation, and capabilities of registering and designing what they see, that we can look for any general results. Mr. FORRESTER has already done much good service by collecting information, and endeavouring to lead the manufacturers back to the older processes—a consummation greatly to be wished by all who prefer the stronger wines of Portugal to those of France and Germany; and he is far too enthusiastic in the matter to rest contented till he has gained all possible information, and effected all that he sees practicable. *M. J. B.*

VEGETABLE PATHOLOGY.—No. XXIII.

102. When the leaves have fulfilled their functions, decay naturally takes place, and wherever the leaf-stalk is articulated with the stem, the leaf at a certain stage falls off, leaving a scar upon the stem, which is frequently marked with little dots, the indications of so many fascicles of vascular tissue which entered into the footstalk.

103. The fall of the leaf does not, however, in every case take place merely in consequence of the death of the lamina. Where the leaf has not attained its full growth, or has not performed all its functions, if the nutriment on which it depended for support be suddenly cut off, the dry leaf will for a long time remain upon the stem. In some plants, on the contrary, as in Heaths, the leaves separate with peculiar facility from the stem, so that it is very difficult to preserve specimens for the herbarium, and analogous phenomena are exhibited by the peduncles of some Grass. Holcus mollis and lanatus, for instance, are at once known from each other by the comparative facility with which the peduncles separate from the stem when it receives a smart blow.

104. If the tissue by which the petiole is united to the bark were perfectly continuous, or, in other words, if it underwent no modifications in passing from the one into the other, whether at an earlier or later stage of growth, it is clear that there would be no tendency to fall at a particular point. This, however, is not the case. In some instances, as in *Dracæna reflexa* (Schacht Pflanzenzelle, p. 424), a layer of cork-cells is developed at the base of the leaf, leaving merely apertures for the penetration of the vascular bundles, insomuch that the immediate connection between the parenchym of the leaf and that of the bark is interrupted, rendering all further interchange of juice impossible, and this is probably the case in many other instances. At least the scars of stems are often covered with a layer of cork-cells. The same observations apply to the separation of the stems of ripe fruit. The separation, or disarticulation, is, however, often carried further than is at first apparent. If the base from which the stalk of a Pear, for instance, is separated, especially where it has been developed from a terminal blossom, be examined in the following spring, a further disarticulation will be found to take place at every point where a bract was seated. In the case of terminal fruit, the disorganization evidently takes place from the scar left by the abortive peduncles, nor is there any peculiar arrangement of the pith in this, as in some other instances, corresponding with the line of fracture. In some cases the decay is not arrested by the living tissue beneath, but passes down into the stem, causing, as we have often observed in Apples, genuine canker, a fact which indicates the necessity in trees of more than usual value or interest, of carefully cutting out in the autumn, or early spring, the very smallest portion of decayed matter still adhering to the tree.

105. It has been shown experimentally by Knight, that in some cases the absorption of moisture by the leaves is so great as to overcome the upward action through the vascular bundles, and to carry unelaborated sap downwards, and to this he is inclined to attribute the growth of Wheat mildew, which is notoriously prevalent when a damp and cold atmosphere succeeds warm and bright weather, the soil meanwhile being too dry to transmit much moisture upwards. However true the facts may be, it must be remembered that such parasites originate in very various parts of the plant, and that, even in the same plant, the parasite may affect different organs. This is evidently the case with Wheat mildew, which is as common on the leaves as on the stem, and by no means originates uniformly in the vascular bundles, while bunt, whose normal situation is in the central tissue of the seeds, is occasionally developed in the stem. *M. J. B.*

IXORA SALICIFOLIA.

THIS species is perhaps the most delicate of the genus; it can seldom be grown to the size of a fine specimen, except it is grafted on some of the stronger kinds.

When I began to cultivate this Ixora I procured a young plant with six good shoots on it, and imagining that it would be difficult to produce a useful-sized specimen quickly, I determined to graft it. I chose a strong healthy young plant of I. coccinea; I. javanica, however, being a more vigorous grower, would be preferable; but at that time it was too scarce to be used for such a purpose. I cut down the stock to within 3 inches of the pot, and I cut up the grafts, using the stronger part of each for fixing on the stock, and the points for cuttings. After grafting I covered with a bell-glass, and plunged in a brisk bottom-heat of about 90°; the only attention it received afterwards, until a union was effected and active growth had commenced, was giving water at the root when it was needed; but as the grafting was performed in February, very little moisture was required. When I perceived that the grafts had united, I untied them, to allow of their swelling regularly, and merely tied them lightly with soft matting to prevent their being accidentally broken off. The bell-glass was then removed, and the plant was kept in bottom-heat, affording it also a warm moist atmosphere; for, like all Ixoras, it delights in plenty of warmth and moisture. Under this treatment it flowered the following June, and, encouraged by my success, I determined to produce a specimen fit for exhibition; and in order to do this as speedily as possible, I cut in, early in February, a large plant of I. coccinea, merely pruning back the shoots to a convenient position for grafting; and having plenty of grafts, these were used unsparingly, placing three or even six on a shoot of the stock, so as to ensure having a well formed specimen for flowering at once. This was plunged in bottom-heat, covering it with hand-glasses with moveable tops, so as to be able to enclose the plant and allow it sufficient space. In about a month, the grafts having taken, with scarcely a failure, the hand-glasses were cleared away, the ties loosened, and the plant exposed to the ordinary treatment of the inmates of the house. The grafts grew away freely, and by the end of June the plant was fit to take a place in a winning collection of 20 plants.

It should, however, be stated that this variety requires a stronger heat to do it well than any of the other Ixoras; and unless this can be afforded, it is impossible to secure active growth. But by grafting on a strong growing variety, as I. javanica, in the manner detailed above, and affording it a brisk moist heat during the growing season, it may be very readily induced to form a fine specimen. The plant exhibited the other day at Regent's Park was grafted in February, 1852, and, with proper convenience, a good large plant for a stock, and plenty of firm pieces for grafts, it is quite an easy matter to graft a plant and show it, in first-rate condition, the same season; when once grafted, with proper management, it will last for many years, but in the case of a plant being grown on for several seasons, the same care that is necessary for the other varieties in ripening the wood, keeping cool, and giving little water at the root in winter, must be practised with this one. And it will also be necessary to cut in the shoots sufficiently to keep the specimen in form, which should be done just before starting it into growth. *Alpha.*

THE RAIN GAUGE AND HYGROMETER.

IN reference to the stringent article which appeared in your columns of the 22d April, demonstrating the fallacy of the information afforded by the rain-gauge, I am induced to offer a few suggestions which may possibly throw some light on this important question.

The error demonstrated by Mr. Lawes in the present instrument cannot, it is conceived, be referable to condensation, since the proportional amount of condensing surface increases with the decreased size of the gauge; but if a sketch of the apparatus be made it will be seen that much of the rain driven by a high wind must rebound out of the instrument, instead of glancing downwards. This error in construction I made apparent to the Ordnance authorities in 1852, and in consequence a 10-inch cubical box has been adopted in its stead. The gauge I have put up here, and which appears to answer every purpose, is made of zinc 10 inches square, 8 inches deep, with a sloping bottom 2 inches deep, terminating in a tube; it has a flap attached to each side, to facilitate its being mounted on a pole. I have placed it at the back of the shed in which I keep my other meteorological apparatus, and a gutta percha tube conducts the water from the gauge to a bottle. The cost of making by a coppersmith here, was 2*s.* 6*d.*, and from it I have

every morning unerring information of the state of my land, so far as regards rain. I have not tested it against any other apparatus, but it indicates the amount of dews.

If, then, the information afforded by the present rain gauge demands so severe an immolation, what is to be said of that derived from the hygrometer? The faults of the one may be estimated, and an allowance made for them, but those of the other are for ever concealed. On reference to the *Times* of last winter, during the period of the hard frost, it will be observed that the "amount of evaporation" was "frozen," whilst the actual evaporation of the "frozen" water or ice, was greater than that before the frost; and it is a well established fact that in Canada and at the North Pole during winter, evaporation, or the drying of clothes, is as rapid as it is in this country under the influence of a summer's sun. The hygrometer tells us that the amount of evaporation last year was less than in the preceding years, but the following figures, as determined by the balance, shows that the evaporation of water was actually in excess of the three preceding years.

	1850.	1851.	1852.	1853.
Grains.	92,140	... 92,075	... 92,080	... 100,680

And what may appear incredible, but is nevertheless a fact, is that in May, with an average temperature of 56°, the evaporation was 19,225 grains; whilst in June, with a temperature of 62°, it was only 11,895 grains, although there fell in May 122 ounces of rain on every 100 square inches, and in June only 107. *Franklin Coxworthy, Author of "Electrical Condition," Maresfield, Sussex.*

Home Correspondence.

The Winter at Oulton Park, Cheshire.—Lat. 53° 10′ N., long. 2° 30′ W.; soil, a sandy loam. Thermometer, Dec. 29th, 1853, at 8 A.M., 11° Fahr.; Dec. 30th, at the same hour, 39° Fahr.; January 2d, 1854, at 8 A.M., 27° Fahr.; Jan. 3d, at the same hour, 7½° Fahr. I. PLANTS KILLED.—Cupressus Goveniana, Uhdeana, funebris; torulosa, five plants killed, three injured, three untouched; Pinus halepensis, Arbutus Andrachne, Ilex latifolia and opaca, Quercus gramuntia, Erica mediterranea, Phillyrea latifolia, Bamboo, common Gorse, all tender Roses. II. KILLED DOWN.—Laurustinus, Bay, Arbutus Unedo, Colletia horrida, Berberis Fortuni, Buxus balearica, Passiflora cærulea, Swainsonia galegifolia, Jasminum Nepalense, Abies Brunoniana. III. INJURED.—Hybrid Rhododendrons, Piptanthus Nepalensis, Ilex Perado, Quercus palustris, Branti, Pinus Llaveana, radiata, insignis, patula, Cupressus sempervirens, macrocarpa (slightly), Taxodium sempervirens, Biota orientalis, Cryptomeria japonica (slightly). *E.*

Wellingtonia.—The following is an extract of a letter from my son (mining engineer and surveyor), dated Jamestown, Tuolumne county, Alta California, July 10, 1853:—"Last Saturday I went along with one of my partners to see the 'Big Tree,' discovered in Calaveras county near the head waters of the Stanislaus river. We crossed the river near Carson's Hill, where the richest pockets in quartz yet discovered in California have been found. From Carson's Hill we went on to Murphy's Camp, where we got horses, and after a three hours' ride over a tolerably good trail, ascending pretty rapidly towards the base of the Sierra Nevada, at first through woods chiefly of Oak and Pine (Spruce), and afterwards of immense Pines, Fir, Arbor-vitæ, and Cedar, we reached a closely-wooded bottom, where the trees were more luxuriant than I have seen in any other region, with a good deal of under-brush, through which we had to force our way, and in this swamp we found the Wellingtonia, whose dimensions are as follows:—Diameter at the ground, 34 feet; diameter 20 feet up, 20 feet; diameter about 120 feet up, 14 feet; height, 290 feet; age estimated at nearly 3000 years. I do not think, however, that it is so old, as I find there is on an average about 15 annual rings in the cross section of its wood near the root to the inch; and taking the tree above the swell of the root at 10 feet to the centre, that is 120 inches, at 15 years to the inch, gives only 1800 years. They are now cutting the tree down, and should it be perfectly solid to the centre, the exact age will soon be ascertained. In all climates which have a decided summer and winter, so as greatly to vary the activity of vegetation, the wood deposit of each year, viewed in the cross section, presents a distinct ring. In the same swamp there are many other trees of nearly the same diameter. I stepped round several, 30 yards in circumference, while one which had fallen has a hollow inside fit to stable 50 horses. This gigantic Methusalem forest of the olden time seems to have extended back into periods anterior to any but geological record. The whole surface of the ground is strewed with immense trunks, or their remains, in every stage of decay, in many instances covered with vegetation, so as to look like green earthen mounds—the mural vestiges of ancient camps—and only by cutting into them are they found to be rotten wood. The other trees of the swamp consist of one species of Balsam Fir, two species of Pine, from 3 to 7 feet in diameter, and from 250 to 300 feet high; and two species allied to the Cedar, of nearly the same diameter as the Pines, but not so tall. Amongst the underwood are Hazel, Raspberries, Currant, Gooseberry, Dogwood, Poplar, and Willow, with a number of others which we do not have in Europe, one of them the Rhus Toxidendron or Poison Vine, poisonous to touch. The bark, for about 100 feet, has been removed from the 'Big Tree,' for the purpose of putting it up in its natural figure at the World's Fair, New York, along with a section of the butt. There has been much talk here of the Goth-like act of cutting down the tree, the largest and oldest in the world, as the Californians boast. It would have been a pity to do so, were there no others like it; but many in the same swamp are nearly of the same dimensions, and I see it reported in the Stockton papers that one found on the head waters of the Moquelumne, in the same county, is 40 feet in diameter." *P. Matthew, Gourdie Hill, Errol, N. B.*

The Winter in Nottinghamshire.—The following is the condition of evergreens at Ossington, Notts, 10 miles north of Newark, three miles from the banks of the Trent, on a clay soil, and on an elevation generally at 40 feet above the water. The thermometer, Jan. 3, 1854, was down to zero, perhaps something below it. Now (June 4) common Laurel in many places cut and injured in old strong plants; Portugal Laurel the same. Common Holly cut, and the leaves turned brown; old strong trees looking brown and sickly. Double Gorse, killed. Deodara, the lower boughs severely cut, some of the boughs killed; the leaves have quite fallen off. Some Deodara plants do not appear to have suffered. Araucaria, the lower boughs turned brown; some quite killed. It seems odd that the last year's shoots at the end of the boughs in many cases have kept their fresh green colour, and have not been injured, while the leaves on the wood two and three years old are turned very brown. Chinese Privet killed. The common Ilex, old strong trees, 30 feet high, have suffered a good deal; many of their branches dead; the leaves quite brown. Arbutus, much cut; old plants 40 or 50 years old, that I do not remember ever to have seen hurt before. Laurustinus, killed to the ground generally; one or two plants injured, but not killed, and are throwing out fresh leaves and shoots. Ilex latifolia, turned brown in the leaves. Bay, killed to the ground. Taxodium sempervirens, turned very brown, but not killed. Cupressus macrocarpa: In the case of six fine plants, the leading shoot killed in every one, perhaps a foot or 18 inches down. Some injured, having parts struck and killed; no plant wholly killed. Cupressus Uhdeana, severely hurt; C. Goveniana, killed. Evergreens not injured at Ossington: common Yew, Golden Yew, Irish Yew, Cupressus sinensis, Cryptomeria, Pinus insignis, Douglasi, nobilis, excelsa, Lindleyana, Russelliana, Cembra. The injury to the Hollies is partial. Variegated, Golden Hollies, and many of the common Hollies, not at all injured. *J. E. D.*

Nidularia fulgens.—I observed at Chiswick, on Saturday last, a new plant, which has been thus named. The name would certainly be appropriate, but the persons bestowing it can hardly have been aware that there already exists a genus Nidularia, one of the most curious and interesting in the tribe of fungi. It would, therefore, be advisable that the name should be changed at once, before the new plant becomes generally distributed. *Cryptogam, June 7.*

Melons.—In growing these, I have a pit which is filled up with stable dung, over which I place about 5 inches of soil. When the heat is declining, I put a plant at each end of the lights, permitting only three Vines to grow from each plant; when these are about 2½ feet long, I stop them, which causes them to push laterals. I now wait until three or four flowers are open in one day, and then I fertilise. If one is fertilised three or four days before the others, it will take the lead, and it is useless to attempt setting any afterwards, for the fruit turns yellow and dies off. Of course as soon as I stop the Vines I keep the pits as dry as possible, until I have four Melons on each plant swelled to the size of a hen's egg; I have thus, at least, eight Melons under each light. I take advantage of all sunny days to ripen the fruit, such as giving no more air than just what will keep the plants from flagging. I should attribute your correspondent's failure (see p. 342) to his keeping his pits too warm, and permitting his Vines to grow too long before they were stopped. I sowed my seeds the last week in February, and I have now Melons as large as they will be, with no other heat at my command than that of sunny days. I omitted to say that as soon as my Melons are swelled to the size of an egg, I give the plants a good watering, provided there is an appearance of fine weather. On some of my plants I have six and seven Melons, which, owing to the roots penetrating the manure, will ripen in perfection. *Cymro Clayton.*

Ephemeral Flowers.—I lately reported to you the case of the night-flowering Cereus. On Thursday I nipped off about half the style of the first flower produced by Hemerocallis flava. The anthers were already dry, having discharged their dust. The flower reopened in good condition on the Friday and the Saturday; but on the third day its colour was darker, with a slight orange tinge, and about 3 or 4 P.M. exhibited signs of contraction, showing that it could not make its fourth appearance. I am anxious to see what H. fulva will do; for, being a barren plant, its sexual relations may not be precisely the same. If Cistus Ladaniferus is now anywhere surviving in England, the owners of it will do well to apply this experiment to its blossoms. *A. H.*

Glass Walls and Orchard-houses.—The extraordinary amount of damage sustained by all kinds of fruit trees in the open air this season will, of course, be the most powerful argument ever brought forward in favour of glass walls and orchard-houses. I think it might be highly advantageous if those who possess glass walls would state the result of their experience as regards their power of resisting frost, as I hope we shall never have such another opportunity of testing their value. I think the question will resolve itself into one of orchard-houses *versus* glass-walls; and should the latter be found wanting, it might save much useless expenditure. I have been led to make the above request by the fact of two orchard-houses in this neighbourhood being crowded with fruit, while the blooms, and even fruit and shoots, are involved in common ruin in a glass wall. *J. Laurence, Farnham Castle.*

Vine Mildew.—As this blight is now evidently appearing again in various localities, a word or two as to the best syringe for the application of liquid remedies in certain cases may be useful. Unquestionably the best syringe, where force is required, is the rose of the ordinary garden engine; but in the case of Grape mildew being present, it may not (after the first general syringing) be requisite to syringe the foliage so frequently as the fruit, as it sometimes happens that blight will make its appearance again upon the latter, while the foliage remains clean and free from it, owing, probably, to the remains of mildew among the bunches (especially if the fruit be clustered) being beyond the reach of any application, in which case it will be almost sure to manifest itself again during the season, and can only be kept under by an effective wash, which it is desirable to apply with as much force as we can obtain; for this purpose nothing is certainly so good as the hose of an engine, but I find in practice that for syringing the bunches only, it is preferable to stop up all the apertures except one in the centre, from which a fine but very sufficient stream is obtained, which can easily be directed upon any particular bunch, and of such force that upon striking the fruit the liquid (which is much economised in this way) is well scattered among the berries; but I would earnestly advise cultivators to remember the old saying, that prevention is at all times better than cure, particularly with respect to the Grape blight, which, if allowed to run on unchecked for any length of time, forms such a dense and compact coating upon the fruit that it is next to impossible to remove it entirely. I feel quite satisfied, however, that, as a preventive, M'Adam's wash will prove invaluable, if applied occasionally, and that it will readily destroy the fungus, if used in the earlier stages of the disease. In my own vineries, to which I referred in a former communication, the blight has now quite disappeared under treatment with this remedy, and I shall have pleasure in forwarding a specimen of the fruit when ripe, that you may observe how decided has been its usefulness. *Devoniensis.*

Effects of the Winter and the Frost on the Nights of the 23d and 24th April, at Badger Hall, near Shiffnal, Shropshire.—On the west side of the house Araucaria imbricata has been much injured, and several small plants are dead; but on the east side a fine plant, 10 feet high, has escaped with very little damage. Taxodium sempervirens, on the western exposure, is much injured; all the foliage is dead, though a few buds are bursting forth at the present time. On the east side a fine plant, 17 feet high, and other smaller ones, are comparatively uninjured, the foliage being only a little browned. Juniperus tetragona is dead; J. chinensis, J. excelsa, J. Bedfordiana, and J. squamata, uninjured. Cupressus thurifera, 23 feet 6 ins. high; C. macrocarpa, 16 ft. high; and C. torulosa, of various sizes, are dead. Glyptostrobus pendulus is uninjured. Arbutus Unedo, A. coccinea, A. Andrachne, are killed to the ground everywhere. A. hybrida, A. Milleri, and A. Unedo salicifolia, are dead. A. procera, in quite as exposed a situation, is alive, and was growing freely, but the young shoots were nipped by the frosts in April. Berberis Knighti has been killed to the ground on the west side, but has escaped unhurt on the east. B. fascicularis is cut down; B. Darwini is injured, and B. trifoliata and B. macrophylla are killed to the ground; B. Lycium, B. glumacea, growing near a wall and protected by Laurels, are uninjured; B. asiatica is killed everywhere. Aralia japonica has only the points of the shoots killed on the west side, but on the east side it is killed to the ground; Daphne pontica and D. japonica rubra are injured; and D. variegata is killed; Cotoneaster microphylla is injured; Laurus Sassafras is uninjured; L. nobilis is killed to the ground everywhere; Viburnum Tinus, Ulex hibernicus, and double-flowering Furze, are killed to the ground everywhere; U. europæus has been killed to the ground in many places. Spiræa Lindleyana is killed to the ground, and Gum Cistus is killed everywhere; Colletia horrida, killed to the sawdust that was put round it to protect it from the frost, is now putting forth shoots; Leycesteria formosa is killed to the ground, also Ribes malvaceum; one very large specimen of Quercus Ilex, 32 feet 6 inches high, 54 feet diameter of branches, and the trunk 7 feet in circumference at 3 feet from the ground, is injured very much. Of several other large trees of Q. Ilex and its varieties, the foliage has entirely fallen off, but a few green buds are now bursting forth; Q. Lucombeana is also putting forth buds; Q. coccifera, a small plant, escaped unhurt; Q. mongolica is uninjured; Q. laurifolia, Q. Ilex latifolia, Q. palustris, are dead to the ground. On a wall with an eastern aspect Thea viridis (Tea plant) was killed to the ground, but is now putting forth one bud. Euonymus japonicus, E. j. aureus, E. j. argenteus, and E. fimbriatus; Ceanothus rigidus, C. papillosus, C. dentatus, C. integerrimus, C. divaricatus, and C. azureus, are killed to the ground. Lardizabala biternata and Stauntonia latifolia were cut down, but are now pushing from the roots. Escallonia macrantha and E. rubra are killed to the ground, and the double white Pomegranate is injured. On the same wall the following were not hurt:—Jasminum nudiflorum, Deutzia gracilis (the latter is in full bloom at the present time), Forsythia viridissima and

Magnolia macrophylla; the Grevillea rosmarinifolia is killed. The following plants are injured, though sheltered by the wall on the west, and on the north by buildings and trees, and on the east by shrubs:—Cerasus Caroliniana and ilicifolia, Cleyera japonica, Photinia dentata and glabra, Broussonetia papyrifera, and the common and variegated Alaternus. The Fabiana imbricata is dead. Pinus insignis, 10 feet high, and P. Montezumæ are dead. On a south wall, a fine plant of Magnolia grandiflora, 10 feet high, by 27 wide, is to all appearance dead; but M. obtusifolia is not more injured than in ordinary winters; M. purpurea is in full flower. The Fig trees are all killed to the ground, although matted up with straw before the frost set in; they are now sending forth shoots from the root. In a small nursery (in the kitchen garden), surrounded on three sides by a Hornbeam hedge, the Yucca-like Dracæna indivisa was cut down to the ground; but it is now throwing up a shoot from underneath the surface. Abies Brunoniana, Thuja flagelliformis, and a fine plant of T. aurea, escaped unhurt, as did also a small plant of Cedrus argentea. In a shrubbery exposed to the east winds, the Deodar lost all its foliage, and some of the lower branches are dead; but on a sandy bank, where it was more sheltered, it escaped uninjured. The handsome Dielytra spectabilis has lived out three winters; it was in full bloom in April, but the flowers were browned by the late frosts. Gunnera scabra was also injured in April. The plant that suffered most from the frost of the 24th April was a fine specimen of Pterocarya caucasica, whose young shoots of several inches in length were quite killed, and it has not begun to put out buds as yet; the Garrya elliptica was browned everywhere, and some branches killed, but it is now putting out buds; Phormium tenax was cut to the ground, but is now sending up strong leaves; Ilex latifolia is a good deal injured, but some of the buds look prominent, and I think there is a probability of its shooting out from the main stem; Cryptomeria japonica, 18 feet high, escaped unhurt, and is now growing freely. Quantities of the common Laurels have been cut off to the ground, and a great many branches continue to wither and die at the present time; some of the common Hollies have lost all their leaves and are much injured. It may be as well to remark that on the night of the 2d and 3d January, the thermometer was down to 1° above zero Fahrenheit. On the morning of the 24th April, the quicksilver stood at 24° above zero (8° of frost), and the ice was quite thick on the fountain in the flower garden. The soil here is sandy, and the situation has been found favourable for semi-hardy plants. *George Cooke, Badger Hall.*

Societies.

HORTICULTURAL: GARDEN EXHIBITION, *June* 3.—The more prominent features of this brilliant midsummer display of flowers and fruits were the following.

In collections of 20 STOVE and GREENHOUSE PLANTS, the first Large Gold Medal was again awarded to Mr. Green, gr. to Sir E. Antrobus, Bart., for the following, viz.:—

- Acrophyllum venosum
- Aphelexis macrantha purpurea
- Azalea præstantissima carnea
- Dillwynia ericifolia
- Dracophyllum gracile
- Erica Cavendishi
- " depressa
- Franciscea acuminata
- Franciscea confertiflora
- Gardenia Fortuni
- Gompholobium grandiflorum
- Ixora crocata
- Leschenaultia formosa
- Polygala cordifolia
- " Dalmaisiana
- Pimelea Hendersoni
- Rondeletia speciosa
- Vinca rosea

Among the above the Polygalas were most conspicuous, being both extremely well grown plants, and finely flowered; of the two, however, Dalmaisiana was certainly the handsomest, the white spots which the flowers possess giving them both life and beauty. The Rondeletia is one of the best specimens of the kind in the country; it was nearly 4 feet in height, bushy and beautifully flowered. Azalea præstantissima, in the form of a spreading cone, was extremely effective, being still loaded with flowers. On the Fortune Gardenia there was still a good sprinkling of its white waxy blossoms; but the height of their beauty was evidently over, as was also that of the flowers of Franciscea confertiflora, which is one of the best and most useful of the genus. The Leschenaultia was a magnificent specimen, being quite 3 feet in diameter and beautifully flowered. The Ixora was not seen to advantage, being scarcely sufficiently in bloom; but when well flowered this species is almost as striking as the scarlet kind.

Mr. Dods, gr. to Sir J. Cathcart, Bart., of Cooper's Hill, Englefield Green, was second. His plants were:

- Aphelexis macrantha speciosa
- Azalea decora
- " Gledstanesi
- Bossiæa disticha plumosa
- Boronia serrulata
- " pinnata
- Coleonema pulchrum
- Erica Cavendishi
- " depressa
- Epacris miniata
- Gompholobium polymorphum
- Leschenaultia formosa biloba
- Polygala acuminata cordifolia
- Pimelea mirabilis
- " hispida
- Vinca alba
- " rosea

These plants were nicely arranged as regards colour, and they were mostly well grown and flowered. The Cavendish Heath was one of the best specimens of the kind we have seen, and there was also an excellent Erica depressa, which was, however, insufficiently in flower. The blue Leschenaultia was much admired for its charming colour, and nothing could possibly be handsomer than the Azalea decora, which was just in perfection. The Pimelea hispida was not sufficiently in bloom. The Everlastings were just at their best, and when found in this condition, with their flowers fully expanded, few plants are more ornamental. The Gompholobium was in the form of a round bush, supported by a few slight stakes, and managed in this way it looks much more handsome than when trained stiffly on a trellis.

Mr. Barter, who was third, sent—

- Aphelexis macrantha
- Azalea præstans
- Boronia pinnata
- Chorozema Henchmanni Lawrenceanum
- Clerodendron squamatum
- Cyrtoceras reflexum
- Dipladenia crassinoda
- Eriostemon buxifolium
- Epacris miniata
- Erica coccinea minor
- " Cavendishi
- Gardenia florida
- Ixora coccinea
- Leschenaultia biloba
- Pimelea mirabilis
- Polygala acuminata Dalmaisiana
- Stephanotis floribunda
- Vinca rosea

Of these the Stephanotis was a fine plant, well covered with buds and expanded blossoms. The yellow Erica Cavendishi was large and unwieldy, but well bloomed, as was also the other species of Cape Heaths. The Gardenia florida was not so fully in flower as could have been wished, but its deep green leaves set off what blooms were on it to much advantage. The Azalea was still in excellent condition, and very effective—the glowing purplish red flowers with which it was furnished being unusually large and beautiful.

Messrs. Fraser, of Lea Bridge, produced:—

- Azalea variegata
- " magniflora
- Allamanda cathartica
- Aphelexis purpurea humilis
- Boronia serrulata
- " pinnata
- Chorozema Henchmanni varium
- Clerodendron splendens
- Dracophyllum gracile
- Epacris grandiflora
- Erica vent. perspicuoides
- Eriostemon buxifolium
- Leschenaultia intermedia
- Pimelea Nieppergiana
- Polygala cordifolia
- " acuminata
- Stephanotis floribunda
- Vinca alba

The Allamanda cathartica here was well flowered, luxuriant, and handsome, its branches not having been tied in so closely as to make it formal, a fault unfortunately too common in the management of plants of this kind. The Aphelexis was covered with large well-coloured flowers, which opened freely. The Leschenaultia was also beautifully in bloom, and the blossoms were unusually brilliant. The Azaleas were likewise very effective, but the flowers of the Stephanotis, and one or two other plants, were not expanded sufficiently to render them so striking as they otherwise would have been. Pimelea Nieppergiana is a beautiful white-flowered kind, not so robust as P. spectabilis, and, therefore, much better suited for persons of limited accommodation.

In collections of 15 STOVE and GREENHOUSE PLANTS, the first prize was awarded to Mr. Carson, gr. to W. F. G. Farmer, Esq., for:—

- Adenandra fragrans
- Aphelexis macrantha humilis
- Allamanda grandiflora cathartica
- Azalea lateritia variegata
- Clerodendron splendens
- Erica Cavendishi
- Franciscea latifolia
- Ixora crocata
- Leschenaultia formosa
- Pimelea Hendersoni
- Polygala Dalmaisiana cordifolia

The Allamanda grandiflora was a well grown plant, with five flowers on it. The Leschenaultia was a beautiful specimen of the kind. The clean appearance and neat habit of Adenandra fragrans must ever render it a favourite, even when out of bloom; but when well flowered, as this was, it then becomes truly charming. Of the Azaleas we have spoken favourably before, and we can only now state that they were still in as good condition as when we first saw them. The Clerodendron was a fine plant, but not out enough.

Mr. Gillham, who was second, sent—

- Allamanda Schotti
- " neriifolia
- Azalea Prima Donna
- " variegata
- Clerodendron fallax
- Dipladenia crassinoda
- Erica ventricosa breviflora
- " Cavendishi
- Ixora coccinea
- Pimelea Hendersoni
- Polygala cordifolia
- Rhynchospermum jasminoides
- Statice Holfordi
- Stephanotis floribunda
- Vinca rosea

The most conspicuous among these was the Jasmine-like Rhynchospermum, which was a large plant, and well flowered. The Allamanda was also well flowered, as was the Holford Statice, which, like its near relation macrophylla, remains a very long time in perfection. The Dipladenia, like those in other collections, was not sufficiently advanced in bloom; in July these charming plants may be expected to be seen in much better condition. The Stephanotis was a noble specimen, and very finely in flower.

Mr. Speed, of Edmonton, produced—

- Adenandra fragrans
- Aphelexis humilis
- Azalea lateritia
- Boronia pinnata
- Cyrtoceras reflexum
- Coleonema pulchrum
- Dipladenia crassinoda
- Erica Westphalingia
- Erica Cavendishi
- Leschenaultia formosa
- Pimelea Nieppergiana
- Polygala Dalmaisiana
- Stephanotis floribunda
- Ditto ditto
- Vinca rosea

The Cavendish Heath, in this group, was a vigorous young plant, finely flowered, and permitted to follow its natural habit of growth, with very little interference in the way of tying or staking. Of the two plants of Stephanotis one was better than the other; but both should not have been shown in the same collection. Erica Westphalingia was finely flowered, but the blossoms, being badly coloured, made little display. The Azaleas were good, as were also the Vinca and Leschenaultia.

From Mr. Rhodes came—

- Aphelexis spectabilis
- Azalea variegata
- " rosea elegans
- Boronia spathulata
- Cyrtoceras reflexum
- Dracophyllum gracile
- Erica Bergiana
- " Alberti
- Epacris grandiflora
- Leschenaultia formosa
- Pimelea linifolia
- Polygala Dalmaisiana
- Stephanotis floribunda
- Tetratheca verticillata
- Vinca alba

The Albert Heath in this group attracted universal attention, on account of the warm buff colour of its blossoms, which were thickly set on a fine specimen. The Boronia spathulata was also a beautiful example of this not very showy species.

Mr. Hamp, gr. to J. Thorne, Esq., Maubey House, South Lambeth, produced—

- Allamanda grandiflora
- Aphelexis rupestris
- Azalea formosa
- " rosea elegans
- Boronia serrulata
- Dracophyllum gracile
- Erica mutabilis
- " Cavendishi
- Eriostemon neriifolium
- Franciscea latifolia
- " angusta
- Ixora javanica
- Pimelea Nieppergiana mirabilis
- Tetratheca verticillata

In the Class of 6 STOVE and GREENHOUSE PLANTS, in pots or tubs not less than 20 inches in diameter, there were two exhibitors, Mr. Over and Mr. Peed, both producing fine specimens, among which were noble plants of Everlastings, Pimeleas, Chorozemas, Boronias, Azaleas, and Heaths. A plant of Erica Bergiana, from Mr. Peed, was especially remarkable for its size and beauty, being literally loaded with multitudes of small round purple blossoms.

Groups of 6 plants in 13-inch pots came from Messrs. Taylor, Pamplin, Roser, Over, and Jarvis. Among these we remarked Everlastings, Polygalas, Azaleas, Pimeleas, Leschenaultias, Boronias, Dipladenias, Heaths, Epacrises, Coleonemas, Hoyas, Tetrathecas, Ixoras, Leptospermum bullatum, with white Hawthorn-like flowers, and the yellow Hibbertia Cunninghami.

EVERLASTINGS were exhibited by Messrs. Fraser and Taylor. The varieties consisted of Aphelexis macrantha purpurea, m. rosea, humilis, spectabilis, s. grandiflora, rupestris, purpurea grandiflora, sesamoides, and speciosissima. Among the best is macrantha purpurea, a deep purple kind, and said to be more easily managed than some of the less handsome sorts.

ORCHIDS.—Nothing could possibly be more brilliant than these were on Saturday last, the various collections exhibited being numerous, fresh, and well varied. In groups of 20 plants, Mr. Williams, gr. to C. B. Warner, Esq., received the highest award for—

- Aerides (variety of) affine
- " crispum
- " crispum var. Warneri
- " odoratum
- Calanthe bicolor veratrifolia
- Cattleya Mossiæ
- Cypripedium Lowi barbatum
- Dendrobium nobile
- Dendrobium Dalhousianum
- Oncidium ampliatum
- Phaius grandifolius
- Phalænopsis grandiflora amabilis
- Saccolabium præmorsum guttatum
- Trichopilia suavis
- Vanda suavis
- " tricolor

Of these the two-coloured Calanthe was a good specimen of a plant that is seldom seen; but which, when well grown and flowered, as this was, is far from being unhandsome, and might be introduced into any collection with advantage. The large leaved Phaius had eight spikes of flowers, all of them most beautifully coloured and in the greatest possible perfection. In fact, this was unquestionably the most striking plant of the group. The sweet Trichopil was furnished with eight of its white, rosy-spotted, trumpet-shaped flowers; and the spotted Saccolabe was a charming plant. Among Aerides there was a large flowered pale variety of affine, which promises to be an acquisition, and a variety of A. crispum named Warneri, very distinct and beautiful. The Cypripedium Lowi had two of its singular flowers in beautiful condition.

The next group in point of merit was furnished by Mr. Woolley, gr. to H. B. Ker, Esq., and contained:

- Aerides crispum virens
- " odoratum
- Barkeria spectabilis
- Cattleya intermedia
- " Mossiæ
- " Skinneri
- Chysis bractescens
- Dendrobium formosum nobile
- Dendrobium Devonianum
- Epidendrum crassifolium
- Oncidium Lanceanum leucochilum
- " ampliatum majus
- Phalænopsis grandiflora
- Sarcopodium Lobbi
- Saccolabium guttatum
- Sobralia macrantha
- Vanda tricolor

The delicate pink Cattleya intermedia, with its deep purple-tipped lip, was a beautiful example of one of the finest of Cattleyas, and the large flowered Oncidium ampliatum was also a good specimen of its kind. The same excellent Barkeria spectabilis, which had been shown on former occasions, was again produced in beautiful condition; as were the White Butterfly plant (Phalænopsis), Dendrobium nobile, and the Moss Cattleya. Cattleya Skinneri, resplendent with crimson, was the best flowered specimen we ever saw.

Of groups of 10 ORCHIDS there were several. The best came from Mr. Clarke, gr. to Mrs. Webb, of Hoddesdon. This consisted of—

- Aerides crispum
- " virens
- " maculosum
- Cattleya Mossiæ
- Dendrobium clavatum
- Oncidium luridum
- " ampliatum
- " altissimum
- Phalænopsis grandiflora
- Saccolabium guttatum

The two Oncids were beautifully flowered, more especially ampliatum, which, when found in this condition, is very showy, and few Orchids remain longer in beauty than this does. The Phalænopsis was also a fine example of that most useful plant. Dendrobium clavatum was much admired for its rich yellow blossoms, whose beauty we need not say is greatly enhanced by the dark spot which they possess. The Aerides and Saccolabe were also charming plants

Mr. Carson, who was second, sent:—

- Aerides odoratum
- " affine
- " Larpentæ
- Cattleya Mossiæ
- Cypripedium barbatum
- Dendrobium nobile
- Epidendrum longipetalum
- Odontoglossum hastatum
- Oncidium Lanceanum
- Phalænopsis grandiflora

The graceful yet half wild beauty of some of the plants of this group, with their long slender flower stems left free and unconstrained, was its great distinguishing

feature. Of this class were Epidendrum longipetalum, Odontoglossum hastatum, and the Phalænopsis. Of these the first named plant, though in perfection for many weeks past, was still fresh and beautiful.

Mr. Dods, gr. to Sir J. Cathcart, Bart., sent—

Aerides crispum	Stanhopea oculata
„ virens	„ tigrina
Angulos Ruckeri	Saccolabium guttatum
Cœlogyne Lowi	Maxillaria aromatica
Dendrobium nobile	Phalænopsis grandiflora

Among these the most remarkable were the Stanhopeas, which were fine plants, and beautifully flowered. The Anguloa Ruckeri had three fine blooms on it. The blossoms of the Dendrobium nobile were very highly coloured, rendering it unusually attractive.

Mr. Green, gr. to Sir E. Antrobus, Bart., produced—

Aerides odoratum	Dendrobium nobile
„ crispum	Epidendrum macrochilum
Brassia maculata	Oncidium roseum
Calanthe veratrifolia	„ Lanceanum
Cattleya Mossiæ	„ divaricatum

Aerides crispum was a strong plant and well flowered, as was also Cattleya Mossiæ, and the warm, rich, small orange-brown flowers of Oncidium divaricatum were much admired.

Mr. Summerfield and Mr. Jarvis also each contributed 10 plants, among which the most conspicuous were Phalænopsis grandiflora, Cattleya Mossiæ, the yellow-flowered Acineta Barkeri, the canary-coloured Peristeria cerina, Acropera Loddigesi, and a small plant of Cypripedium spectabile.

In collections of 15 Orchids Messrs. Veitch showed :

Aerides affine	Dendrobium nobile
„ odoratum	Epidendrum vitellinum
Anguloa Ruckeri	Oncidium ampliatum
Cattleya superba	Phalænopsis grandiflora
„ Mossiæ	Sobralia macrantha
„ Aclandiæ	Sarcopodium Lobbi
Cypripedium barbatum	Vanda Batemanni
Dendrobium Devonianum	

When viewed from a distance the most striking plant in this group was the Sobralia, which was furnished with upwards of a dozen large purple blossoms. The Moss Cattleya was also a noble plant, and equally well flowered. The Devonshire Dendrobe was in a basket sufficiently elevated to allow its spikes of charming flowers to hang down, and, treated in this way, it produced a really fine effect. The Bateman Vanda was not far enough advanced in bloom. The buff-coloured Sarcopodium attracted attention, on account of its singular form ; and few, perhaps, have seen a better-flowered plant of the Bearded Lady's Slipper than that which this collection contained.

Messrs. Rollisson, who were placed second, had :

Aerides crispum	Dendrobium moschatum
Brassia verrucosa	Oncidium flexuosum
Cattleya Aclandiæ	Odontoglossum nævium
„ citrina	Phalænopsis amabilis
„ Mossiæ	Saccolabium guttatum
„ superba	Stanhopea Bucephalus
Cypripedium caudatum	Sobralia macrantha
Dendrobium nobile	

The singular long-tailed flowers of Cypripedium caudatum commanded a greater share of attention than even the most showy of the Cattleyas, though some of the latter were very fine. The Brassia verrucosa had some 15 flower spikes on it, and the colours of the blossoms being nicely brought out rendered it unusually ornamental. The yellow Cattleya citrina and Odontoglossum nævium were also objects of admiration, the one for the rarity of its colour in the genus to which it belongs, and the other for the curious ragged appearance of its small, spotted, white flowers.

Of Azaleas, three collections in the shape of nicely flowered small plants were exhibited by Messrs. Jarvis, Taylor, and Roser. Among them we remarked a variety of Gledstanesi called formosa, Juliana, coronata, perfecta elegans, Iveryana, Perryana, lateritia, semiduplex superba, Magniflora, and magnificent.

Of Tall Cacti in flower there were two collections ; one from Mr. Green, the other from Mr. Gillham. The varieties consisted of Cereus Mallesoni and speciosissimus, Epiphyllum Jenkinsoni, coccineum, multiflorum, rubrum cæruleum, Ackermanni, and Egertoni.

Roses in Pots, with the exception of those from Messrs. Lane & Son, were not so good as they were in May. In the first group, fine though they were, there was also evidence of a falling off ; it contained an admirable example of the Tea Rose Adam, with flowers extremely large and fine ; Hybrid Bourbon, Coupe d'Hébe, Chenêdolé, and Paul Perras were also in good condition, as were Hybrid Perpetual, Queen, Louis Peronny, Caroline de Sansal, and Duchess of Sutherland. Noisette Miss Glegg is a small, white, free-flowering kind, in the way of Aimée Vibert.—Mr. Francis, who was second, had the beautiful Bourbon Souvenir de la Malmaison, Hybrid Perpetual, Mrs. Elliott, Aubernon, La Reine, Amandine, and Baronne Prevost, and a good plant of the Tea Rose, Elise Sauvage. Hybrid China, Blairi, and Belle Marie were also in fair condition. Among the plants from A. Rowland, Esq., who was first in the amateur's class, none were near so handsome as Paul Ricaut, which is unquestionably one of the best shaped and finest Roses in cultivation. Géant des Batailles was out of character, the flowers being a faded purple instead of deep glowing crimson, or rather scarlet, as they should have been.

Cape Heaths were numerous and well flowered, especially those from Messrs. Rollisson, Peed, and Fraser. Smaller plants in good condition were also contributed by Messrs. Taylor, Roser, and Over. Notwithstanding the excellence of all of these, however, they failed, as they always do, to attract that attention which was paid to exhibitions of other kinds of plants. This doubtless arises very much from the sameness which to a great extent pervades all Cape Heaths, not only in colour but also in form ; and until exhibitors turn their attention to varying their collections more in both these particulars, but especially as regards shape, by permitting each variety to follow its natural habit, whereby a diversity of appearance would be produced, they must still expect exhibitions of this kind to fall in public estimation. The specimen of Bergiana from Mr. Peed is an illustration of the kind of growth that is wanted, and let us hope that others may follow so excellent an example

Admirable Variegated Plants, and others remarkable for fine foliage, were contributed by Messrs. Veitch and Rollisson. In addition to the sorts mentioned by us in our report of the May show, there were extremely good examples of the different species of Anæctochilus and Physurus, the red and white veined Marantas, Cheirostylis marmorata, Rhexia chrysophylla, Arum giganteum, Duranta Baumardi, Philodendron pertusum, Tillandsia, Crotons, a fine plant of Cissus discolor, the variegated Pine-apple, Stenorhynchus pictus, the noble looking Rhopala corcovadensis, and other plants of a similarly interesting character, which were much admired for their variety.

Among Miscellaneous Single Plants by far the best was the new Nepenthes lanata, from Borneo, from Messrs. Veitch. The same firm also sent a Rhododendron, named Catawbiense album grandiflorum, which had white flowers spotted with pale green in the upper petals, and looked as if it would be hardy. Mr. Gaines had an Azalea something in the way of Exquisita, which appeared as if it would prove an acquisition. A first-class Certificate was awarded it, and a second-class one to Messrs. Veitch's Rhododendron. The last-named firm also showed two Gloxinias, one named mirabilis, the other Leonora Van Houtte, and a Dipladenia very like crassinoda. I. Anderson, Esq., of Edinburgh, had what was called a hybrid Geranium, raised between G. sanguineum and G. anemonefolium, but evidently a mere seedling from the last.

New Plants consisted of the rare and curious Uropedium Lindeni, and two plants called Nidularia fulgens and Gaultheria pulchra, from Messrs. Rollisson; a woolly white-flowered Hoya, from Messrs. Henderson, of Pine-apple Place ; and the bright golden yellow Leptosiphon aureum, from Messrs. Veitch, a very fine annual. Of others of less importance there were a blue shrubby Lobelia, from Mr. Hamp; a Caladium and Maranta, from Messrs. Osborne ; two sorts of Gompholobium, Billbergia, Duc de Croy, and Didiscus pilosus, from Messrs. Henderson ; a tall plant of Cantua dependens, from Mr. Coe, gr. to Mrs. Fitzgerald ; and Gesnera Donkelaari, from Messrs. E. G. Henderson & Son.

Pelargoniums this time were numerous and in excellent order, as they always are at the June show. The first Gold Banksian Medal was awarded to Mr. Turner, of Slough, for a collection of plants skilfully grown and beautifully flowered. Mr. Dobson received the second Gold Banksian Medal also, for a group of well-managed plants ; Mr. Mockett was third, and Mr. Gaines fourth. We have thought it unnecessary to repeat the names of the varieties, as they were so recently fully given in our report of the Royal Botanic Society's exhibition in Regent's Park. In fancy kinds Mr. Turner was also first, his plants being everything that could be desired, both as regards growth and bloom. Mr. Gaines was next, and Messrs. Henderson third ; all of these groups were highly creditable to their respective growers. Of French Pelargoniums Mr. Gaines had a collection which attracted everybody's attention, on account of the novelty and singularity of their appearance, each of the petals in all of the flowers being marked with a dark blotch, and some of them being streaked and shaded in a most interesting way, with various colours. Their names were Jaques Duval, Triomphe de la Sour, Gustave Odier, Madame de Lamoricière, Gloire de Bellevue, and Col. Fossy. Their flowers were certainly not well shaped; but each truss was so large as to be quite a bouquet in itself, and so striking and showy is their whole appearance that they will, doubtless, speedily become very great favourites.

The exhibition of Fruit was again extensive, well varied, and excellent. The best collection was furnished by Mr. Fleming, gr. to the Duke of Sutherland, at Trentham. It contained three Cayenne Pine-apples, weighing respectively, 3 lbs. 15¾ oz., 3 lbs. 15½ oz., and 3 lbs. 5 oz.; two Trentham Hybrid Melons, and a Cashmere Melon of great excellence ; May Duke Cherries, large and good Grosse Mignonne, and Royal George Peaches ; Elruge Nectarines, excellent Black Hamburgh Grapes, and very fine Old Pine Strawberries. Mr. Tegg, gr. to A. Pryor, Esq., of Wandsworth, had the next best collection, in which were Royal George Peaches, Hunt's Tawney and Elruge Nectarines, Black Hamburgh Grapes, large both in berry and bunch, Brown Turkey Figs, and three King's Green-fleshed Melons. The next collection in point of merit came from Mr. Patterson, gr. to the Baroness Wenman, Thame Park, Oxon. It consisted of very good Black Hamburgh Grapes, Noblesse Peaches, large and fine ; May Duke Cherries, and a dish of a seedling Strawberry called Patterson's Scarlet Nonpareil, which was pronounced by the judges to be one of the best flavoured of the large-fruited kinds. It was stated to have been raised between Keens' Seedling and the British Queen.

Mr. Clements, of Oak Hill, East Barnet, sent a Providence Pine, weighing 7 lbs. 7 oz. ; two Antigua Pines, two Black Jamaicas, and a dish of Black Hamburgh Grapes. From Mr. Hill, gr. to R. Sneyd, Esq., Keel Hall, Staffordshire, came Black Prince and Black Hamburgh Grapes, all of them fine bunches, and beautifully coloured ; also Royal George Peaches, and Elruge Nectarines. Mr. Ivison, gr. to the Duke of Northumberland, at Syon House, sent four Vines in pots, each couple (a black and a white fruited sort) being fastened together in the form of an arch, the fine clusters of fruit hanging down from which had a capital effect. The pots were neatly mossed, and the exhibition, altogether, did equal credit to Mr. Ivison's taste and his skill as a cultivator. The kinds were Black Hamburgh and White Muscadine, both well fruited, and the black bunches extremely well coloured. The same exhibitor also had 6 pots of Keens' Seedling Strawberry, and a dish of Brown Turkey Figs. Mr. Henderson, gr. to Sir G. Beaumont, Bart., and Mr. Hamp, gr. to J. Thorne, Esq., also had collections of fruit. Mr. Turnbull, gr. to the Duke of Marlborough, at Blenheim, produced a Providence Pine-apple, weighing 8 lbs. 11½ oz. ; a Cayenne, 3 lbs. 1 oz. ; an Enville, 3 lbs. 10 oz., and a Sierra Leone Pine, of 3 lbs. 15 oz. ; likewise Black Hamburgh and Muscat Grapes, the latter finely grown ; British Queen and Keens' Seedling Strawberries. Mr. Stanley, gr. to J. J. Blandy, Esq., of Reading, sent three compact equally-swelled bunches of Sweetwater Grapes. Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent, produced bunches of Black Hamburgh of great excellence. Mr. Lushy, gr. to J. Hill, Esq., of Streatham, also had an exhibition of Black Hamburgh, and another of Black Prince Grapes, both of which did him much credit. A beautiful basketful of Black Hamburghs likewise came from Mr. Mitchell, of Brighton ; and Mr. Martin, gr. to Sir H. Fleetwood, Bart., had dishes of the same variety of Grape, together with Black Prince and Black Frontignan. From Mr. Dods, gr. to Sir J. Cathcart, Bart., came Black Hamburgh. Mr. Chapman, gr. to J. B. Glegg, Esq., had a Providence Pine, weighing 8 lbs. 5 oz. ; and a Black Jamaica, 3 lbs. 9 oz. From Mr. Robinson, gr. to Lord Boston, came four Providence Pines weighing respectively 6 lbs. 15 oz., 5 lbs. 7 oz., 5 lbs. 6 oz., and 5 lbs. 4 oz. Mr. Taylor, gr. to H. Ingram, Esq., of Temple Newsam, near Leeds, sent a beautifully shaped and well ripened Black Prince Pine, weighing 6 lbs. 13 oz. Mr. Jones, gr. to Lady Charlotte Guest, also showed Pine-apples. Mr. Ferguson, of Stowe, sent a very fine dish of May Duke Cherries, which were stated to have been ripened in a span-roofed house without fire-heat. Messrs. Lane had also some small Cherry trees in pots, loaded with fruit, which had been ripened under similar circumstances. Mr. Bailey, Shardeloes Gardens, Bucks, sent a Providence Pine weighing 7 lbs., a Lemon Queen 4 lbs., a dish of Strawberries, and a green-fleshed Melon. From Mr. Judd, gr. to Earl Spencer, came well ripened Brown Ischia Figs, and some very good Brown Turkey Figs came from Mr. Baily, of Nuneham. Mr. Constantine, of Hillingdon, sent Nerii Figs, large and fine for that sort, also Black Hamburgh and Black Prince Grapes, a Queen Pine-apple, Royal George Peaches, and four dishes of Strawberries, consisting of British Queen, Kitley's Goliath, Prince of Wales, and Trollope's Victoria. Mr. Sparrow, of Moor Park, Herts, showed some highly coloured and very good Elruge Nectarines. Mr. Smith, of Twickenham, furnished British Queen Strawberries, both gathered and in pots, and a dish of Keens' Seedlings. Mr. Toy, gr. to W. Lyon, Esq., had some excellent examples of the British Queen.

The best Melons, next to the Cashmere one in Mr. Fleming's collection of fruit, were a Bromham Hall, from Mr. Young, gr. to Lord Barrington ; a Trentham Hybrid, from Mr. Carpenter, gr. to Sir F. Scott, Bart. ; and a Hybrid Green-fleshed, from Mr. Munro, gr. to the Earl of Clarendon.

Of foreign fruit, Mr. Lewis Solomon, of Covent Garden, placed upon the table a basket of fine Pomme d'Api and white Calville Apples. The regulations did not permit of competition on the part of fruiterers.

Notices of Books.

The Chemistry of Common Life, by J. F. W. Johnston, M.A. (Blackwood). No. 4, *The Beverages we Infuse;* No. 5, *The Sweets we Extract ;* No. 6, *The Liquors we Ferment*, are, in every respect, as excellent as the earlier numbers previously noticed in our columns.

The Natural History and Habits of the Salmon, by Andrew Young (Longman)—fcp. 8vo ; pp. 108—is a good account of salmon spawning, and contains an interesting chapter on salmon laws, to the badness of which, as actually enforced, the author in a great measure attributes the decline in value of our fisheries.

Part II. of the *Micrographic Dictionary* has appeared (see p. 323), and we regard it as a decided improvement upon its predecessor. It has no woodcuts, and we hope the succeeding numbers will also be without them. Woodcuts are excellent for delineating large objects, or diagrams explanatory of ideas, but they are unsuitable for the representation of delicate microscopical facts. The introductory matter relating to the management of the microscope and the preparation of objects is an excellent treatise, and is finished in this number.

The Old Printer and the Modern Press, by Charles Knight (Murray). Fcp. 8vo ; pp. 314.—The first part of this interesting and instructive little volume consists of the biography of our great printer Caxton, and an account of the means of obtaining and diffusing knowledge before the complete establishment of the press. The second part "embraces a very broad view of the

progress of the press to our own day, especially in relation to the important subject of cheap popular literature." The thorough acquaintance of Mr. Knight with all matters relating to the modern book trade have enabled him to draw up an outline of its actual state, which all interested in the progress of society would do well to peruse. The remarks on international copyright, the readers in the United States, and the influences of the best books, are especially deserving of attention. The two parts together give as popular and interesting a history of printing and its effects as can well be desired.

New Plants.

66. CLERODENDRON BUNGEI. *Steudel. Van Houtte, Fl. des Serres, t.* 863 ; *aliàs* C. fœtidum *Bunge, &c.*

This plant, as exhibited at a late meeting of the Horticultural Society, would appear to be undeserving notice among cultivators ; for it was presented in the form of a half-starved, long-legged shrub, with one shoot terminated by a little corymb of dull rose-coloured flowers of no beauty. If, however, we can trust a figure of it published in the *Flore des Serres*, it must be remarkably handsome, for its leaves are represented as more than 6 inches long, almost as broad, dark green, with rich crimson veins on the under side ; and the flowers are made to form a corymb nearly 7 inches in diameter, composed of rich rose-coloured corollas an inch across, with violet anthers. It is also stated to be *perfectly hardy* in Belgium.

We must add, in justice to Mr. Van Houtte, that if our wild specimens, gathered by Mr. Fortune in the North of China, are the same as C. Bungei, as we believe, then they corroborate the exactness of his plate as to magnitude and form ; of colour we have not the means of judging. In Paris, M. Decaisne, in speaking of a Chinese C. fœtidum (*Rev. Hort.*, 1851, p. 405), compares the leaves in size to those of Paulownia imperialis, and confirms the hardiness of his plant in Paris. It appears, however, that M. Decaisne regards the Paris plant, which he now calls *C. Lindleyi*, as distinct from that of Belgium, to which the name of C. Bungei is applied.

FLORICULTURE.

RIPENING HOLLYHOCK SEED.— At the great Hollyhock and Carnation Show, which took place at Glasgow in August last, 12 magnificent spikes of Hollyhocks were exhibited by the Messrs. Paul, of Cheshunt. Of these, when the show was over, I had nine spikes, which were immediately put in water, and placed on a table, so as to continue the gratification of viewing them as long as they would remain fresh. After ten days, however, they began to assume the sere and yellow leaf, and hence they were removed, and laid on a heap of cut short Grass, in which there was a considerable heat. I did not think more of them until a few days afterwards, when, passing the heap, I observed seed pods forming on them ; I then removed them, cut a small portion of the lower end off each spike, and placed them in wet sand under glass, for about four weeks, when I considered the seed to have been ripened ; I then took them out of the sand, and laid them carefully aside to dry for a few days ; I afterwards removed the seed pods from the stems, and kept them till the middle of April last, when I sowed the seeds on a hotbed under glass, and have now the satisfaction of seeing upwards of 60 fine healthy young plants, the produce of my friend's noble flowers, which so deservedly carried off the first prize at the exhibition alluded to. *J. N.*

SEEDLINGS.

RANUNCULUS : *K.* A well shaped flower, with a clear yellow ground colour, tipped with purple. A very fine variety.

Miscellaneous.

Brazilian Orchids.—The following prices were realised at the sale to which we last week drew attention :— Cattleya crispa, 1*l.* 10*s.* to 8*l.* ; C. c. superba, 1*l.* 18*s.* to 10*l.* ; C. c. candida, 2*l.* 10*s.* to 4*l.* 15*s.* ; C. intermedia, 1*l.* 5*s.* to 8*l.* ; C. Leopoldi, 6*l.* to 13*l.* ; C. lobata, 7*l.* to 17*l.* ; C. violacea, 1*l.* 5*s.* to 4*l.* 10*s.* ; a new (?) Coryanthes, 2*l.* to 3*l.* ; the rest produced from 1*l.* 2*s.* to 5*l.* 15*s.* a lot. The high prices thus obtained were evidently owing to the excellent condition of the lots, and to their consisting of species the beauty of which is universally known.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Many of the climbers here, as Passifloras, Mandevilla suaveolens, Tecoma jasminoides, &c., will now be growing very freely, and frequent trimmings will be necessary to keep them in proper order. The young shoots should be allowed to grow in a natural manner, merely preventing their getting too much entangled, or growing in masses. The flowering of many varieties of the Passion-flowers will be hastened by stopping the young shoots, and any shoot which may be hanging too low should be stopped, which will prevent confusion, and induce the production of flowers. During weather such as we are now experiencing, the shading must not be used too freely, and care must be exercised to keep the atmosphere moist, giving air sparingly, except on the sheltered side of the house. Let there be no crowding of the plants, but allow every specimen full space, especially hard-wooded plants. It is a very common practice in the management of the conservatory, to huddle the plants very closely together, in order to produce a dense mass of bloom ; and where soft-wooded plants only are used this is of little consequence, but hard-wooded things are very readily injured in this way, and many a promising specimen is ruined. Re-arrange the plants frequently, and at once displace any that incline to become shabby.

FORCING DEPARTMENT.

PINERY.—Where a regular supply of fruit is required, and but limited accommodation afforded for producing it, the most practised grower cannot always avoid disappointment. The plants expected to afford the late autumn supply should now be got together, and every means used to induce them to show fruit ; and if they have been kept dry at the root for three weeks or so, after completing their first growth, by thoroughly watering the soil, and keeping warm and moist, they will generally show fruit at once. If not already done, lose no time in giving the Black Jamaicas and Cayennes for winter fruiting their final shift, and push them along for the next two months as quickly as possible, so as to get the pots well filled with roots, and secure strong plants; for unless this is attended to, their fruiting at the proper time will be quite a matter of chance. After this season use fire-heat sparingly, but shut up early in the afternoon, at a temperature of 90° or 95°. In the event of cold cloudy weather occurring, however, the fires must be used more freely, for the stock must not be allowed to sustain the smallest check at this season. Give a liberal supply of manure water to all plants that have moderately filled their pots with roots, especially those swelling their fruit. VINERIES.—Where not already done, the litter should be removed from the borders ; but where the roots are found to have crept up into it, which will probably be the case where the Vines were started early, the decayed portion at the bottom should be left, and every caution used not to disturb the roots. After removing the litter, it will be necessary to top-dress the border to prevent the surface roots from being injured. A slight coat of decayed turf and horse droppings from the Mushroom-house will answer very well ; but the best Grape grower we know thatches his borders with clean straw, beginning at the front and working up to the house, which throws off heavy rains, and retains the moisture most effectually ; and judging from the crop of Grapes annually produced by this cultivator, it is a capital practice. See that the borders of houses where the fruit is swelling are kept properly moist, and be particularly careful to have them in a good healthy state during the colouring period. PEACHES.—Maintain a moist atmosphere where the fruit is swelling, and use every possible means to keep the foliage clean and healthy ; for if this is injured by spider at this time, it will greatly injure the present crop, and the mischief will extend to next season's crop as well. Give abundance of air after the fruit begins to ripen, and keep the atmosphere cool and dry. Also give air freely in the fore part of the day where the fruit is swelling ; but shut up early in the afternoon, after syringing and moistening the borders, passages, &c. This will save fuel, and also prevent red spider from becoming troublesome.

FLOWER GARDEN AND SHRUBBERIES.

The cold, drying east winds which have lately prevailed have been excessively trying to newly-planted "bedding stock," and have doubtless served to convince many of the folly of planting out weakly, ill-prepared stock. While the present weather continues, the plants must be well supplied with water at whatever expense, especially where it is of importance to have them in bloom early. The nights being cold, and not unlikely for frost, we prefer watering in the morning to doing it in the evening, and risking the consequence of even a slight frost upon the wet plants. Where it can be done the whole surface of the bed should be watered with a rose, giving sufficient to keep it moist for the day. Under this treatment our own plants are rooting freely, and making some little progress in the tops, and will soon be sufficiently established to do with an occasional watering. Get the whole of the plants pegged or staked, as the case may be, as quickly as possible, in order to prevent their being blown about and injured by the wind. Also stir the surface of the soil occasionally, which will soon become very close, through being watered so frequently. Look frequently to trees that have not got well established since having been removed, and give a thorough soaking of water whenever it is required, afterwards mulching the surface, to prevent evaporation. Any valuable specimen that may appear to be suffering much from the drying effects of the weather must be watered over-head every evening with the garden-engine.

FLORISTS' FLOWERS.

Part Polyanthuses ; always choose for them a cool and shady situation, sheltered as much as possible from north and easterly winds. After being planted, they should not be allowed to flag or become very dry, as they are extremely susceptible in such cases of being affected with the red spider, which is a sad pest. Remove awnings from Tulip beds; cover with a hand-glass any pods of seed which may have been fertilised, in order to prevent the wet entering the top of the capsule and rotting the seed ; break off all other seed-vessels, the foliage decays sooner, and they may consequently be lifted earlier. In the case of breeders, which we were anxious should be rectified, we should allow them to ripen their seed, as it weakens the energies of the bulbs, and predisposes them to become variegated the succeeding season. Mulch Dahlias with rotten dung, and give plenty of water in dry weather. Disbud Pinks ; occasional doses of liquid manure will be of service, but not strong. Propagate Pansies by the side shoots; mark seedlings worthy of being saved, and pull up the others.

HARDY FRUIT AND KITCHEN GARDEN DEPARTMENT.

The Peach border should be examined where there is any danger of its being too dry for the healthy growth of the trees, giving it a good watering if it be found to require it, as, if the growth is at all checked at present, and the autumn should prove wet, there will be great danger of the trees growing too late, and the wood being badly ripened. Proceed with nailing, and avoid laying in a single shoot which will not be required next season. Where insects or mildew are still troublesome lose no time in applying the usual remedies. Persevere in the use of them until the enemy is fairly overcome, in order that healthy wood may be secured. Strawberries must be liberally supplied with water, especially on light soils of a dry hot nature, for, should the present weather last much longer, there will be no chance of securing a crop without liberal waterings. If not already done, the early Celery should be planted out at once. Endeavour to injure the roots of the plants as little as possible in transplanting, keep them well watered and shade slightly from bright sunshine until they get established. All recently transplanted things, as Cauliflowers, &c., must also be carefully attended to with water while the present drying winds continue. In situations where the Peas are liable to be infested with mildew in dry seasons, it will be advisable to give the lines a thorough soaking of water, and afterwards mulch the ground.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,

For the week ending June 3, 1854, as observed at the Horticultural Gardens.

June.	Month's Acc.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth 1 foot deep.	Of the Earth 2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 12th and 13th, 1842—therm. 90 deg.; and the lowest on the 15th, 1850—therm. 30 deg.

Notices to Correspondents.

APHIDES : *Welton.* Fumigation, or dusting the leaves with ground tobacco, wetting them first to make it stick, are the best remedies.‡

CACTI : The seedling No. 1, raised by Mr. Thomas Jobling, gardener to Mrs. Hodgson, of Stelling Hall, Northumberland, from Cereus speciosissimus, fertilised by pollen from C. grandiflorus, is a very fine variety, with the scarlet of Ackermanni, and the size of C. grandiflorus. No. 2 is equally, if not more, beautiful, though paler. If they remain open 48 hours, as we are informed, they must be regarded as great acquisitions.

CLOCHES : *Meta.* You may possibly be able to obtain them at the Glass Works, Bristol.‡

DISEASES : *F D L.* The three Grapes which you have forwarded are affected with rust, respecting which you will find many notices in our columns. One of them is slightly decayed, but probably merely from accidental injury in transmission. The leaf which accompanied them is affected with a disease similar to that which is so prevalent on Pear leaves, and which is supposed to be caused by an Acarus, but not to such a degree as to be materially injurious to the Vine.—*J A.* The Vine leaves have precisely the same excrescences upon them as in the case noted above. In neither have we found the slightest trace of any insect, though there is an aperture in many of the little warts, exactly as in those on Pear leaves. We have no apprehension that the general health of your Vines will suffer. *M J B.*

NAMES OF PLANTS : *J B Whiting.* Orobus luteus.—*P G E.* 1, A Mormodes, with which we are unacquainted; perhaps the M. leucochila of Klotzsch; 2, Epidendrum pterocarpum.—*L.* Sophronitis grandiflora.

PAINT FOR IRON : *Felix.* The proportions of Mr. Fleming's are one-third Stockholm tar to two-thirds gas-tar. It is laid on while quite hot.

ROSE SHOOTS : *J M.* They are covered with Uredo Rosæ. Nothing can be done to prevent it.‖

TRANSPLANTING : *St Derbyshire.* Transplant your old Yew Hedge in the end of August or beginning of September. Cut round your Oak and Elm by opening a circular trench 6 feet from their trunks in the beginning of August; let the trench be 6 inches wide at least, and 3 feet deep. Replace by good rich vegetable soil the earth removed in forming the trench, and finally transplant in November, securing the trees against wind by the usual triangle.

VINES : *Querist.* There is no objection to the grafting or inarching a black Grape on a white Grape stock; the Mill Hill Black Hamburgh, for example, on the white Sweetwater. It is true that it is a dogma amongst some growers, not to water before, or during sunshine. They, however, do not object to one of those refreshing summer showers, which is often immediately succeeded by a hot, bright sun; nor is there any reason for the dogma itself.

AN ACCOMPLISHED FACT.

RICHMOND AND CHANDLER (in competition with the best selected Chaff-Cutters of the most celebrated makers in the world), at the Show of the Royal Agricultural Society of England, held at Lewes, have carried off the highest prize of 10*l.*, eliciting at the same time the most marked approbation of the Consulting and other eminent Engineers connected with the Society.—Implement Works, Manchester, and 32, South John Street, Liverpool.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*

WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.

Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.

WM. INGLIS CABNE, 10, Mark Lane, London.

GUANO (PERUVIAN) AND CHEMICAL FERTILISERS.—NITRATE OF SODA; PERUVIAN GUANO; SUPERPHOSPHATE OF LIME; AGRICULTURAL SALT; AND CONCENTRATED MANURE FOR TURNIPS.

The above articles are supplied on the lowest Cash Terms, for best qualities only, on application to Mr. JOHN CLARANCE, Agriculturists' London Agent, 1A, Bishopsgate Street Within.

TURNIP SOWING.

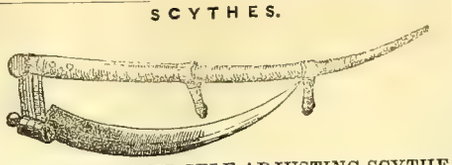
SUPERPHOSPHATE OF LIME, made from Bone, which is the best Manure for Root Crops (see the Royal Agricultural Society's Journal, Vol. vi., part 2). PERUVIAN GUANO, NITRATE OF SODA, BONE DUST, SULPHURIC ACID, and all other Manures of known value. The PEAT MOSS CHARCOAL COMPANY have appointed the undersigned Sole Agents for the Sale of this fixer and distributor of Ammoniacal matter. They are also Sole Agents (in London) of the Patent Sanitary Company for the sale of their "Nitrogenised Carbon."—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

NITROGENISED CARBON MANURE. — This powerful Manure will be found an excellent substitute for Guano, AT LESS THAN HALF THE PRICE. It contains a large proportion of Ammonia, in addition to all the highly fertilising salts, phosphates, and fœcal matter, in solid and liquid sewage, in a concentrated form, absorbed into Shale Charcoal. This will be found a genuine article, as proved by the analysis of Professor Way, the Chemist of the Royal Agricultural Society of England, and, quality considered, is by far the cheapest Manure in the market, and being perfectly dry and pulverised, it may be easily distributed in any quantity per acre that may be desired.

Price Five Guineas per ton at three months' credit, or a Discount of Five per Cent. for cash. Bags and Packages included; delivered free to any Railway Terminus or Wharf in London.

Address to the Secretary of The Patent Sewerage Manure Company, 22, Lincoln's Inn Fields.

SCYTHES.

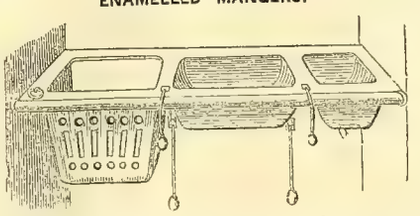


BOYD'S PATENT SELF-ADJUSTING SCYTHE will last out three of the ordinary sort, and is always ready for use.

"We have seen this Scythe at work, and can strongly recommend it."—See *Mark Lane Express*, May 16, 1853.

To be had of every Ironmonger and Nurseryman in the kingdom; and wholesale and retail of WM. DRAY AND CO., Agricultural Implement Makers, Swan Lane, London.

BARTON'S PATENT STABLE FITTINGS, AND ENAMELLED MANGERS.



THESE FITTINGS have all the newest improvements and are the only patented invention of this description. Also Improved Stable Fittings with Rack, Manger, and Water Trough attached, New Pattern Manger and Water Trough combined; Corner and Straight Mangers, Plain, Enamelled, and Galvanised; Stable Furniture of every description, Iron Gates, Railing, Hurdles, Sheep and Game Wire Netting, Registered Poultry Troughs, Fountains, Feeders, &c.—JAMES BARTON, IRONFOUNDER, SMITH, &c., 370, Oxford Street, a few doors east of the Pantheon.

NEW OAT CRUSHERS, 2*l.* 15*s.* 6*d.*; do., 4*l.* 5*s.* 6*d.* CHAFF CUTTERS, 1*l.* 7*s.* 6*d.*; do., 2*l.* 19*s.* 6*d.* MANGLES, 2*l.* 10*s.* 6*d.* FLOUR MILLS, 4*l.* 10*s.* 6*d.*

MARY WEDLAKE & CO., 118, Fenchurch Street, London.

WEDLAKE'S CELEBRATED HAY-MAKING MACHINE (Original Patent), recently improved so as not to clog, and which obtained the Silver Medal at Derby; manufactured by the Daughter of the Inventor, not complicated, and unequalled for simplicity of construction. Order immediately, so as not to be disappointed in the season, and to get them now at one-fourth of the price usually charged in June and July. Beware of spurious Machines offered by unprincipled traders as MARY WEDLAKE & Co.'s; also,

WEDLAKE'S DOUBLE HORSE, HAY, AND STUBBLE RAKE, doing the work of 10 to 15 women. Price 10*l.*, and 3*l.* 10*s.* 6*d.*, both Implements recommended by Mr. J. Morton, in the new "Cyclopedia of Agriculture;" also OAT CRUSHERS, 2*l.* 15*s.* 6*d.*—118, Fenchurch Street, City.

Just published, price 1*s.* 6*d.*,

HOW TO MAKE HAY IN THREE DAYS, and at one-half of the usual expense, in any County and Weather; or, Hints to Haymakers. Also, How to Keep a Horse for less than 9*s.* per Week.—118, Fenchurch Street, City.

MORNING FROSTS.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Removing to 112, Regent Street, London.)

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

NOTE.—The letters received daily at the Offices from this year's customers fully support the high character this Manure obtained last year.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

THE "ECONOMICAL" MANURE,

SO CALLED, BECAUSE

1¼ TO 1½ CWT. PER ACRE, COSTING 15*s.* TO 18*s.*, IS AMPLE, AND FULLY EQUAL TO 3 CWT. OF THE BEST PERUVIAN GUANO: THUS SAVING AT LEAST 50 PER CENT., BESIDES CARRIAGE, &c.

THIS quantity is quite sufficient, and must on no account be exceeded, as injury instead of benefit arises if more is used, the Manure having been purposely manufactured in a highly concentrated state.

The Agricultural world is respectfully urged to read the hundreds of Testimonials from all parts of ENGLAND, SCOTLAND, and WALES, FRANCE, BELGIUM, and SPAIN, to be convinced that this Manure warrants especial and immediate attention. They prove that it gave most wonderful results last year on every soil and crop, far surpassing the expectations of the purchasers.

No one reading the Company's Pamphlet can doubt its being by far the cheapest of all Manures. In fair comparative trials on every kind of soiland crop with Guano, Dung, and other long recognised fertilisers, it will be seen the "ECONOMICAL" was superior; that it proved most valuable for Fruit Trees, Shrubs, and Garden Purposes, and produced the most astonishing effects upon manure heaps, applied in solution, decomposing in fifteen days all vegetable matter, Peat included, and that it is a perfect deodoriser for liquid manure, besides enhancing its fertilising properties.

PRICE 12*l.* PER TON, Packages included, and delivered free on Rail or Wharf in London.

Orders received at the Offices of the BRITISH ECONOMICAL MANURE COMPANY, 10, MARK LANE, LONDON, where a pamphlet, containing hundreds of Testimonials from all parts of ENGLAND, SCOTLAND, and WALES, FRANCE, BELGIUM, and SPAIN, with directions for use, samples, and all particulars, may be had, or will be sent gratis on applying to

BENJAMIN COVENEY, *Manager*.

GOOD AGENTS WANTED.—AN ALLOWANCE TO THE TRADE.

N.B.—This Manure may be applied broadcast with great effect on Turnips and Root crops generally, after they are out of the ground; and in cases where the plants are weak from any cause, it will be found to give them an extraordinary vigour.

*** Attention is called to the Advertisement of the Company in this Paper of last week, where numerous Testimonials in favour of the Manure from all parts of the Kingdom, both from this year's customers as well as last year's, were given.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.

Chemistry—J. A. C. Voelcker, Ph D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.

The next SESSION will begin early in AUGUST. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

The GUIDE TO THE ROYAL AGRICULTURAL COLLEGE FARM may be obtained of HAMILTON, ADAMS, & Co., Paternoster Row, London; and EDWIN BAILY, Cirencester. Price 1*s.*

THE THIRD CHELTENHAM SUMMER POULTRY SHOW will take place at that magnificent establishment PITTVILLE SPA, on the 14th and 15th of June. For Prize Lists and full particulars enclose a stamped directed envelope to JESSOP BROTHERS, Secretaries.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.—The Show at Berwick-on-Tweed takes place on the 1st, 2d, 3d, and 4th of AUGUST, when Premiums to the amount of 1500*l.* will be offered for Stock and Implements.

All Entries must be made on or before June 17. Prize Sheets and Forms of Entry to be had on application to the Secretary, 6, Albyn Place, Edinburgh.

JOHN HALL MAXWELL, Secretary.

The Agricultural Gazette.

SATURDAY, JUNE 10, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, June	14	Agricultural Society of England—Professor Way's lecture.
THURSDAY,	15	Agricultural Imp. Society of Ireland.
WEDNESDAY,	21	Agricultural Society of England.
THURSDAY,	22	Agricultural Imp. Society of Ireland.

THE POLICY OF LABOURERS' FRIEND SOCIETIES was discussed last Monday before a meeting of the Central Farmers' Club. It appeared that members had come together prepared to hear a paper read upon the Friendly and Benefit Societies established by labourers themselves, for their own relief in sickness and old age, mistaking the terms of the announcement on the card, which referred to societies established not by labourers but *for* them; such, for instance, as the Witham and the Roding, and many other "Labourers' Friend Societies," which aim, by money rewards, at the promotion of good conduct and agricultural skill among the labouring men of their respective districts. This misunderstanding possibly interfered somewhat with the character of the discussion which followed the opening paper—for it frequently betrayed a disposition to leave the real point at issue, which was the policy of money rewards for good conduct, and refer to the merits of savings' banks and benefit societies amongst labourers.

On the proper subject of discussion, however, there were not wanting those present who were prepared to defend the policy alluded to, and who spoke with just admiration of the advantages of bringing all classes together on occasions when it was shown that the interests of working men had a place in the minds of their employers—and when addresses by the clergymen of the neighbourhood on the duties of employers and employed would have far greater influence than if delivered from the pulpit. Reference was made to the pleasure evidently given to the working men themselves on such occasions—to happy faces—clean smock-frocks, &c. And some gentlemen alluded in terms of condemnation to the ironical strain in which, as they asserted, the opening paper was conceived, and the mistaken view it took of the conduct and the objects of the societies which it criticised.

On these points we would simply refer our readers to the paper itself. There is not a bit of irony throughout it. It gives perfect credit to the sincere benevolence of the promoters of these societies. Its criticisms are given, not arbitrarily, but with the reasons which, in our opinion, justify them. It is surely perfectly possible to admire the motive, and yet condemn the conduct to which it has led. Is there no such thing as unwise benevolence, or zeal without knowledge? We believe our labourers' friend societies to be generally under the guidance of men who really are the labourers' friends, and who

sincerely desire their welfare; but is not that a reason why their conduct should be all the more anxiously examined, and its tendencies pointed out?

There can be little doubt of the advantage of the annual meetings, on the importance of which so much was insisted, but the attendance would be just as large, and the result as satisfactory, though money rewards for benevolence, morality, and abstinence from drunkenness and crime, were omitted from the attractions. The objection was made that the opening paper had asserted that rewards for good conduct had no moral influence. That assertion was confined solely to one reward it had specified as existing in the list of, we think, the Northleach Society, viz., money to the family who had been at greatest expense during the year, on account of sickness; this, it was asserted, was simple charity, and could have no moral influence on others, and was, therefore, beyond the scope of a society aiming at the promotion of good conduct and of skill.

But we have no hesitation in saying that a money reward for morality or benevolence has a most *im*moral influence, and is altogether mischievous and mistaken. The whole subject is one which deserves detailed discussion and examination, and this we shall from time to time bestow upon it, in the desire not to damage these societies, but improve them—not, by any means, to ridicule or uselessly criticise, but to increase their usefulness and efficiency.

There were many at the meeting on Monday who sympathised with the criticisms then made, and with the resolution which was proposed by the writer of the opening paper. It advised that labourers' friend societies should abandon that portion of their prize lists in which money rewards are offered for benevolent conduct and for personal morality, and generally that such societies should direct their principal attention to the promotion of increased skill in agricultural operations. The objection made, and which prevailed against it, was that, if the Central Farmers' Club passed any condemnatory resolution, it would lose caste and influence. We really think that the influence of the club in question would be more real and lasting if it should guide its conduct by the simple rule of reason and justice, regardless of the results which such a course may bring upon itself.

THE inventor of the screw-propeller is said to have declared his regret that he ever thought of it; the harassing labour of effecting its introduction into practical use having wearied and exhausted his bodily and mental resources more than all the protracted study and experimental trial by which the idea was first developed. And many valuable discoveries have been unquestionably suffered to die in embryo, because of the opposition or disregard meeting their first announcement. Now we greatly fear that, from similar causes, some of the most important of modern suggestions in husbandry will be found to be for years without enlarged application; that we shall remain for a long time denying ourselves the advantages they proffer us, out of negligence or incredulity.

The two novelties in TILLAGE and MANURING—the two great branches of cultivation—manifested the one at Lois-Weedon, the other at Myre-mill, Tiptree, and some other places, are not yet meeting, we think, with that agricultural sanction which their reputed success seems to demand. Both systems profess to replenish the soil with the food of crops more cheaply than our best farming has yet been able to do it. One consists in an improved mode of returning to the fields that large proportion of their vegetable produce in an altered state, called manure, combined with efficient tillage; in a proper rotation of such cropping as robs the soil with such as forms itself more largely out of the "viewless air," combined with high farming practised in every department. The other enables the cultivator to maintain the fertility of his land by a greater perfection of mechanical tillage; professing even to supersede the necessity for returning any portion of the crop to the soil, or for a succession of different crops upon the same spot. The two systems do not collide in any way: one may be adapted to circumstances in which the other might fail; and, indeed, if each can produce remarkable profits, why should not a combination of the two be made to exhibit yet more extraordinary results? There is no inconsistency in a journal simultaneously enforcing (as this has been found to do before now) the merits of the all-manuring and non-manuring schemes of culture. For both, in fact, solve the same problem, the two methods differing no more than an algebraic and geometrical process.

With reference to the Lois-Weedon husbandry, we take it for granted that our readers are convinced of the following truths:—We state them in a rough and homely manner, with no pretence to scientific phraseology or correctness—viz., that our crops feed upon two sorts of nourishment, one of which they draw principally from the air, the other entirely out of the earth; that the latter (called their *mineral* food) bears no larger a proportion to the former (called their *organic* food) than the salt we eat at dinner bears to our beef and bread; that plants will always help themselves to the former, according to their appetite, if we give them liberty; that the latter sort of food lies in the earth in two states, prepared and unprepared—cooked and uncooked for their vegetable mouths, which are partial to drinks, gruel or soups, instead of joints; and, lastly, that, as fast as the plants devour up the prepared morsels, atmospheric agencies will make ready more of the indigestible crude provision, if we give them sufficient opportunity. Every plant in a crop, then, must have room to grow; must be relieved of the presence of hungry thieving weeds, in order to secure a full supply of the first kind of food. The supply of the latter sort in the soil is always equal to the demand; its diminution is so gradual that it is practically inexhaustible; like the marvellous outflow from the conjuror's bottle, though pushed to the last extremity, it will not fail, only it must be kept in an incessant course of preparation—one way of doing this being, as we have implied, to submit the soil and subsoil to atmospheric action, opening it up to the free influence of air, rain, heat, frost, &c.

We suppose our readers, then, to be theoretically well-affected towards the system which, by continual mechanical tillage, can produce large yields without the assistance of rich manures. But the question of expense, and doubt as to practical result, deter them from a trial. Capital and adventurous enterprise are lacking either to spread high farming, costly feeding, and steam-manuring over the surface of our counties, or to supersede ploughing by manual labour with fork and spade. Now it is our opinion that Lois-Weedon husbandry is not calculated for extended adoption without some modification, but that it may be made a source of immediate profit on a large proportion of our corn lands, without requiring any great disarrangement of plough-teams, or the sole employment of expensive and scarce hand-labour. Mr. SMITH'S yield of more than four quarters of Wheat per acre, year after year, has been doubtless owing to complete pulverisation by the loosening upturning fork, and deeply-trenching spade; but why may not a less surprising yet still profitable return follow the cheaper and less effective action of plough and cultivator? JETHRO TULL himself certainly used a plough; and the horse-hoe with which he wrought such wonders was, in fact, just what he called it, a "hoe plough," and turned over a furrow-slice. The spade, perhaps, will alone suffice on strong land, where the plough would defeat our endeavours by forming an impenetrable pan, and by squeezing up a solid furrow-slice, defiant of all drags or horse-pulverising; but we are anxious that some such scheme as we shall suggest may be tried upon the many deep friable loams suited to the purpose.

I. A. C.

AGRICULTURAL STATISTICS.

THE attainment and successful operation of a sound, correct system of agricultural statistics, however desirable, is not quite so easy a matter as some may imagine. Such a system has more than one enemy to contend with, the chief being, perhaps, that "individual suspiciousness," bordering very closely on "selfishness," of which you spoke and complained the other day. This is the true lion in the path; though, in justice to our Scottish neighbours, the beast does not seem to have inspired them with terror equal to that felt by their brethren in the south. Allow me a small space in your columns to the consideration of this absurd reluctance to furnish information touching the affairs of agriculture, and which by many has been construed into an interference with their private business, and an invasion of their domestic concerns, under the mask of zeal for the general good—an idea not less foolish than narrow-minded. I speak advisedly—it is both; for the information, though derived from individual sources, being divulged only in the aggregate, and for the general good, cannot by possibility operate prejudicially to such as wish to remain incognito, and yet who do not shrink from contributing their quota of knowledge to the national stock. That many, perhaps the great majority, should be anxious to repel the prying of idle curiosity, who can wonder? Such resistance implies but a proper spirit of independence, for which no one ought to be held blameworthy. I would not quarrel therewith; but we may quarrel with the want of discrimination between mere Paul Pryism and a patriotic zeal for the public welfare, as not only disparaging to the liberality and discernment of the individual, but highly detrimental in a national point of view. We are not, however, disposed to dwell too long or too harshly on the shortcomings of the farmer, in a matter at once novel and repugnant (however erroneously) with his general habits and feelings. We ought in fairness to take into the account that, after all, the enquiry is but an experiment, and that where, as but in too many cases, aversion is manifested to experiments in the field, we cannot wonder at similar, or even greater, objections to those of a more questionable character on paper. The only wonder is, that with all these elements of opposition at hand, the measure should have been so successful; for successful it surely must be called, when, out of five counties, the quantum of prejudice amounts to but 3½ per cent., as in Hampshire; to 2¾ per cent., as in Norfolk; and to a mere cypher, as in the three Scotch counties. Whoever has had any experience in the establishment of agricultural societies and farmers' clubs will bear testimony to the weakness and absurdity of the arguments urged against them by some who doubtless consider themselves wise in their generation. The leading feature in the opposition to them, or at least to the publication of the proceedings, was principally a fear of their landlords, on the part of those tenants who, having no leases, regarded them as a sort of Damocles' sword, perpetually suspended over their heads, and ready to fall on the first notification of any rumoured superiority of crop, indicative of permanent improvement. Even in the event of a lease, a certain shyness was often exhibited to furnishing particulars—in other words, to state the whole truth—lest advantage should be taken, on renewal, either by the landlord or his agent. Other objections were occasionally raised, but these were the most prominent; and no doubt influenced many to reject the Government measure of agricultural statistics because it was a Government measure; and as such might be turned against themselves as a body. All this is very absurd, and would be proportionally injurious; but that the amount of prejudice is, as we have seen, too small materially to affect the grand result. A little leaven, we know, leaveneth the whole lump; but much depends on the quality of the article so applied; and happily in the case before us, it has proved far too weak to do either good or harm. The foregoing observations apply mainly to the tenantry; but are the landlords wholly free from blame in the matter? Is their influence always exerted in the right direction? their example, for the promotion of general rather than individual good? Are their judgments always guided by sound discretion? and not distorted by political antipathies and party spirit? I heartily wish I could answer these questions in the affirmative; but a tolerably large acquaintance with, and close observation of the vagaries of some of this class, warrants no such acquiescence on my part. True, their number is but small; yet they do exist, and, as a very minute portion of smut-balls may contaminate a large measure of Wheat, so do their example and influence operate upon the little world around them, and by slow and imperceptible degrees effect a pretty considerable amount of mischief. I do not speak without book on this point, as the following case will testify. To many it will appear apocryphal, if not altogether destitute of credit; but we pledge our word for the truth of the story, the documents on which it is founded being at this moment before us, and all the parties well known to us. When the late Earl of Leicester, then Mr. Coke, first introduced the Southdown breed of sheep into Norfolk he was strenuously opposed by many, both owners and occupiers of land, who differed from him in politics, and who regarded his attempts to exchange the dun for the black-faced, the polled for the horned sheep, as not merely impolitic but absolutely revolutionary; and not only cautioned their neighbours against them, but in the instance to which we have adverted, the landlord went so far as to introduce a clause into his leases, prohibiting his tenants from keeping the new-fangled breed, to the exclusion of the old, legitimate sheep, the horned black-faced Norfolks. His then steward and tenant furnished us with these particulars, though at his request we refrain from mentioning the name of the party, adding in a note which accompanied the lease sent to us: "Mr. —— lived long enough to see the error of his ways, having for many years kept a large flock of Southdowns."

Our own observation has furnished us with many similar cases, in which, ridiculous and almost incredible as the thing may appear, the politics of the individual were clearly exhibited by the colour of his sheep. As in the case of the old squire's sheep just mentioned, it would seem as if the plan of collecting agricultural statistics must be bad, because it emanates from the wrong men; but we cannot help congratulating the advocates of the system on the success of this their first attempt to bring it to bear, when compared with the small minority by whom it was resisted. *T.* [We see that a grant of 6000*l.* has been made to the Highland Society, to be expended in obtaining agricultural statistics for this year in all the Scottish counties; and that a sum is named for expenditure in further experiments in the same direction in England.]

Home Correspondence.

Cool Farm-yards for Summer Feeding.—One of the greatest difficulties in feeding is the reconciliation of winter and summer—the Scylla and Charybdis of graziers. The roofs of my house and buildings look now as cold as winter, and as white as snow, having been lime-washed by my farm labourers. The result is a pleasing and profitable temperature; for when the sun shines, every slate is cold, except those unlimed, which are scarcely cool enough to bear one's hand. The heat is reflected instead of absorbed, by the whitened surfaces. The same principle is advantageously applicable to our towns, where the upper rooms and

attics are insufferably hot during the summer months. This coolness causes a remarkable diminution in flies, and, perhaps, London bugs. Flies will not readily alight on the whitened walls and slating, and when they do, fall a more ready prey to the swallows. Rain will not wash off the lime, but the frosts of winter remove it, and with it any vegetable matter that may have grown on tiles or slates, thus giving to old roofs a new appearance. The affair of cost is trifling—the comfort great; the same remark applies to stables. In South Wales the roofs of houses are, I am told, all lime-washed. A slight coat of white paint answers well. Of course, every one lime-washes the inside of cattle sheds, cellars, stables, &c., once a year. This is my second year's experience in this matter. *J. J. Mechi.*

Tiptree Farming.—Permit me to correct an error or two (arising, no doubt, from his hurried visit) in "J. B.'s" friendly remarks on my farm. I sow winter Oats (not Barley) with my Tares. All my land is drained, and I have none to re-drain. The Oat fields were liquid manured last year, when in Mangold Wurzel; this year only guanoed. If "J. B." will come now, he will find a full crop and all the furrows filled up, or closed in by the growing crops. Thin sowers must be satisfied to be found fault with in the spring, especially on late cold bird-lime-like clays. I wish our Hampshire, and other agricultural friends, would try one bushel of Wheat against two, as I did for several years. They would probably, on well-farmed land, find, as I did, that it makes the rent of the land difference in favour of the one bushel. Five pecks is a safe quantity; but so much depends on soil, season, time of sowing, and quality of farming, that between 3 and 6 pecks must be the range. Absurd quantities are generally sown of most grain, but a reform is gradually taking place. When people say thin sowing won't answer, I find, in nine instances out of ten, the parties have never made practical comparisons, and are, therefore, ignorant as to the facts. My Barley and Oats are this year sown 2 bushels to the acre, and, although on miserable soil, I will show them against our thick sowing friends on their rich land. I hope they will come and judge for themselves. The Tares found fault with were purposely late sown, and will be an abundant crop. *J. J. Mechi, June 3.*

Gorse or Furze for Cattle.—Gorse has been proved for a length of time to be a most valuable food for cattle and horses, as a substitute for hay. This plant flourishes upon sharp sands with a dry subsoil, and yields about 10 tons per acre. The soil should be cleansed and pulverised, as the seed is best put in with a drill, giving about 20 lbs. per acre. Being aware the slug is the great enemy, when the plant just comes out of the ground, and only in its first two leaves, and at that time easily devoured, it is, for safety, best to apply 1½ cwt. of saltpetre per acre, which relieves all anxiety on that point. It has been proved, by careful trials, with a cow fed upon Gorse or Furze in November, that the yield of quality and quantity of cream and butter exceeded that of any other mode of feeding. The practice has already been so beneficial that every friend of his country must wish a continuance of its success, in which we most heartily join. *Richmond and Chandler.*

Management of 100 acres of first-rate Grazing Land.—About seven years ago I had the following suggestions in a little talk with an aged and experienced countryman on the best method of managing 100 acres of excellent grazing land. The prices of the cattle, as then given, do not correspond with those high ones of the present time, nevertheless the value of the scheme or system is not less on that account. I merely forward you a copy of the note I made at the time of our conversation. The old man is still alive:—

"I would immediately give about 7*l.* each for 60 Scotch Kyloes, and put them upon 20 acres of it, to pasture there from now (May) till August, at that time I reckon each would on an average bring 10*l.* I would also buy in 200 sheep—good hogs—at 1*l.* each, and put them upon 30 acres till August or September, when they would each be worth 50*s.*, and I should have their wool besides. Again, I would give 7*l.* each for 60 lean drape cows to depasture on 20 acres; it would carry them till October, when I think they would fetch 14*l.* a piece. These cattle and sheep would stock 70 acres, and the other 30 acres I would reserve for growing hay, and the aftermath or fog would be very valuable. I reckon my 60 Scotch Kyloes would cost 420*l.*; my 230 sheep, 200*l.*; and the 60 lean drape cows, 420*l.*, the same as Kyloes, so that 1040*l.* would buy my stock to begin with. My rent would be 600*l.*, making 1640*l.* The sheep would be worth 500*l.*; Scotch Kyloes, 600*l.*; and fat cows, 840*l.*; altogether, 1940*l.* I should have the fleece of 200 sheep, which would average 12 lbs. of wool for each sheep, and at 2*s.* a lb., is 240*l.* I should buy in during autumn 300 Cheviot lambs, at 5*s.* each, and after wintering them upon the hay, &c., I reckon they would be worth 8*s.* apiece, leaving 45*l.*; and my system would improve the estate." [Probably all this might be done on a rental of 600*l.*—the error is in speaking of 100 acres.]

Societies.

ROYAL AGRICULTURAL SOCIETY.

Monthly Council, *June 7.*—Colonel Challoner, Trustee, in the chair. One governor and thirty-six new members were elected.

Finances.—Mr. Raymond Barker, Chairman of the Finance Committee, read the report on the accounts; from which it appeared that the current cash-balance in the hands of the bankers at the end of the previous month, was 1548*l.*

Lincoln Meeting.—Mr. Barker then reported from the General Lincoln Committee the favourable progress of the works, for the ensuing country meeting in that city, and the numerous entries of implements, machinery, and live-stock for the show.

Prize-Essay.—Mr. Pusey reported from the Journal Committee the following award in the Miscellaneous Class of Essays:

To William Wallace Fyfe, of Nottingham: the prize of Ten Pounds, for his Report on the Management and Economical Values of Timber, as the best essay competing in the class of "any other Agricultural Subject."

Essay-Prizes.—The Council deferred till their next monthly meeting the final arrangement of the subjects and amounts of prizes for the essays and reports of next year.

Indications of Age.—On the motion of Mr. Fisher Hobbs, seconded by Mr. Hudson, of Castleacre, the following resolution was agreed to unanimously, namely: "That, on account of the immediate practical importance of the two lectures recently delivered before the Society by Prof. Simonds, on the age of animals as shown by their teeth, these lectures be at once prepared for publication in the second part of the Journal for this year: but as that number will not be due till the 1st January next, that Prof. Simonds be allowed to print off from the type and wood-cuts as many copies as he may require for the purpose of publishing the lectures in the form of a pamphlet, at a cheap rate, in time for purchase by the public at the Lincoln meeting."

Steward of Poultry.—On the motion of Mr. Fisher Hobbs, seconded by Mr. Hudson, of Castleacre, Sir Archibald Macdonald, Bart., was appointed the Steward of the Poultry Department at the Lincoln meeting.

Judges.—The judges of implements and live-stock for the Lincoln Meeting were then, with a few exceptions, finally appointed.

Country Meeting of 1855.—A report having been read from the Town-Clerk of Carlisle, on the amount of railway accommodation in the north of England, it was carried unanimously, on the motion of Mr. Raymond Barker, seconded by Sir Matthew White Ridley, Bart., that the city of Carlisle should be the place of the Society's country meeting next year.

Communications were then submitted to the Council, and reserved for further consideration, from Mr. Spooner, on the National Importance of Promoting Improvement in the Breeding of Cavalry and Artillery Horses; and from Mr. Frere, on the Appointment of a Consulting-Botanist to the Society.

Adjourned to Wednesday, June 14th, at 12 o'clock, when Prof. Way would deliver his lecture on Peat-Charcoal and other Deodorising Substances.

Farmers' Clubs.

London, *June 5.—On Labourers' Friend Societies.*—A paper on this subject was read by Mr. Morton, of which the following is an abridgment:—

I must confess that it was not because of any belief in the great influence of Labourers' Friend Societies on the condition of the labouring population that I ventured to suggest their present policy as being worthy of the attention of this club. Scattered as such societies are, at such wide intervals over the country—with such an extensive field, therefore, to each, over which it has to administer what power it may possess—their influence cannot be very great. And I believe that there are few gentlemen resident in country localities who have taken an interest in the welfare of the labourers around them but must feel that that has been comparatively little influenced in this particular way. No doubt the hearty union of many in pursuit of any object renders that object easier and more likely of attainment; but, if the object be, as in the case of most of our labourers' friend societies it professedly is, the moral improvement of the district, I believe it will be found that individual influence and example, and not that of societies, is the only really useful and efficient agent. No one, I think, will dispute the opinion that a single energetic man, an employer of labour, whether he be a farmer or a manufacturer—with a personal character for rectitude and benevolence—kind enough to wish his neighbours well, and *wise* enough, as well as able, to *work* for that end, as well as wish it, will exert a far more powerful and successful influence for good upon the labourers around him than any society, with its system of direct rewards, could hope to do, though it held its meetings in the market-town close by, and was supported by all the gentlemen in the county. Although, however, the power of such societies may not be great, yet it is something, and being directed to an object which we all feel to be of the very highest importance, it is greatly to be desired that it be directed aright; and as it is certain that the discussions and the resolutions of the Central Farmers' Club do exert a considerable guiding influence on many of the local agricultural societies, I hope that the present policy of these societies in reference to the agricultural labourer will this evening receive full and dispassionate consideration.

In the first place, then, what is the present policy of our local Labourers' Friend Societies? This is to be gathered from their prize lists and their rules. In order to answer this question, I have gone through the rules and the reports of upwards of 50 of the local societies of England, and of many more in Scotland and in Ireland. I do not refer to Farmers' Clubs and Discussional Societies, of which there used to be many and are still a few in the country, but to local agricultural societies, established, if we adopt the title of the South Cheshire Association, "for the encouragement of agricultural enterprise, and the promotion of industrious and moral habits among the labouring portion of the community." The fourth general rule of the Cowfold (Sussex) Association puts the objects and the policy of these societies still more plainly. It is as follows:—"That two classes of prizes be offered by this Association—Class I., for the encouragement of enterprise amongst the farmers. Class II., for good conduct and skill amongst labourers." On the first class of means employed I am not about to say anything; the subject on the card confines me to the second—the means employed by our agricultural societies for the benefit of the labourer. These means have, as the words quoted indicate, two objects in view, the promotion, namely, of good conduct and of skill.

It so happens that, among 100 letters which I received two or three years ago from the secretaries of these societies, in answer to a request for information, only two referred to the influence which it was believed such societies were exerting in the country. The one letter referred to their influence on the skill of the labourer, and the other to their influence on his moral standing; and as those letters state pretty fairly the opinions on the subject which I should like to see embodied in this evening's resolution, I will read them. The first is from the secretary of the Isle of Thanet Sheep-shearing Society. It states—"The object of this society is to improve the labourers that perform such work, and to encourage them by rewarding them with prizes—and I certainly can state they are very much improved since this and similar societies have been formed." Here, I take it, is a testimony to the success of these attempts, by exciting emulation, to increase the skill and the efficiency of the labourer. My second testimony is from the honorary secretary of the North Allerton Agricultural Society. He states that that society is supported directly by the best names amongst the well-known agriculturists and breeders of Yorkshire, and that it thus has advantages over many other local societies; but as to the influence of its rewards for good conduct—for long servitude—and avoiding parish relief—he says:—"Having an opportunity of witnessing the practical working of the society, I am enabled to say that the premiums to agricultural labourers produce little or no good either to the labourers as a body or to their employers, and in my opinion there would be far more wisdom in offering premiums to the best cultivated gardens or plots of land than in the present supposed method of rewarding the poorer classes. Probably the best proof of this view of the case is that there is scarcely any competition for the premiums at present offered, and the labourers can only be induced to compete at the suggestion of their masters." I may add in corroboration of this last remark a sentence which I find at the foot of the prize list of a Cheshire association. "Members of the association are particularly requested by the committee to endeavour to induce cottagers in their respective neighbourhoods to become candidates for the premiums offered for their competition." Well, in this second letter we have, I think, a testimony to the inefficiency of the system of money rewards as incitements to improved moral conduct. These two letters, then, state plainly enough the usefulness of attempting, by money rewards, to excite to greater skill—and the uselessness of attempting, by money rewards, to induce a higher moral standing; they exactly state the opinion on the subject which I hold myself, and which I should be very glad to see embodied in a resolution of this club. These letters are, as I have said, of several years ago; but it is plain that their value as evidence is altogether independent of their date. I may mention, by the way, that the greater number of the reports of the societies which I have examined within the last few days are of two or three years ago; but those of the past, and even of the present season, which I have also seen, maintain their original character; and I believe, therefore, that I am safe in reading the *present* policy of our labourers' friend societies in those reports of a few years ago, as well as of the present time, which I have in my possession.

And, first, as regards prizes for evidence of skill:—

[A prize list was then read, in which rewards to ploughmen, shepherds, hedgers, thatchers, hoers, barnsmen, hop-dryers dairy-maids, chaff-cutters, shoeing smiths, allotment tenants, and cottagers (for bread, for domestic economy, neatness, &c.), were offered for *skill* in their respective operations and proceedings.]

The second division includes premiums for good conduct. Most societies of the kind have a preliminary rule excluding from the competition any who cannot produce certificates from their respective ministers as to their general good conduct. I see, too, that what are called clergymen's prizes are or were offered by the North-East Hants Agricultural Association:—

The clergymen's prize of 3*l.* 3*s.* will be given to the agricultural labourer, or the now disabled cottager, who was an agricultural labourer, who, living within the circle of the North-East Hants Association, shall obtain from his parochial minister, and one churchwarden, the highest character for honesty, industry, sobriety, attention to his children's education, and his own religious duties; the certificate must particularly state if he and his family are regular in their attendance on divine worship, at his own parish church.

The clergymen's prize of two guineas, in like manner, to some single woman, widow, or spinster, above the age of 55 years, &c.

I cannot but think, notwithstanding full sympathy with those who offer such prizes, in the object which I presume them to have had in view, that this way of attaining it is altogether mistaken. I would submit to you that a money reward for honesty is an absurdity—that a money reward for industry should be given in the form of wages—and that a money reward for attention to religious duties is apt to be a premium upon hypocrisy.

[The second division of the prize list was then gone through it includes prizes to the labourer who has brought up "the largest number of children born in wedlock without parish relief;" to him who has "placed out the greatest number in respectable service;" prizes for "long servitude in the same family;" for widows who have maintained families without parish relief; *for those who have spent most on the doctor during*

the year (!); for the oldest men who can prove that they have not been convicted of crime; for those who have supported impotent relations; for those who have most in the savings' bank; or who have subscribed longest to a benefit society.

This, then, states the policy of Labourer's Friend Societies on both divisions of the subject. I must add that rewards for good conduct are confined to England. I find them as far south as Cornwall, and as far north as Penrith, but they do not cross the border. The nearest approach to anything of the kind in Scotland is a prize given for neatly managed cottages and gardens, which I see announced in the list of an East Lothian Society. I am informed, however, by Mr. Hope, of Fenton Barns, that no rewards of any kind are now offered to labourers in East Lothian. And I am informed by Mr. Hall Maxwell, the Secretary to the Highland Society, that while they encourage cottages, gardens, hedge cutting, draining work, and so on, they never had prizes for long service or large families; and their premiums, such as they are, consist of medals or money, not of coats and buttons. In Ireland, again, no such rewards are offered either. In most districts there, indeed, there is not generally that distinction between labourer and occupier of land that there is with us; and the prizes are confined to 2*l.* and 1*l.* rewards for small plots of well-managed crops, whose cultivation it is desired to encourage.

Well, then, having thus stated what the methods adopted by our English Societies for the benefit of labourers are, we are in a position to criticise them. As to the first division of their efforts, no difference of opinion will exist, the excitement of emulation is the best way of increasing skill, and the only thing of importance will be to direct the rivalry aright, so that it shall include all the processes and operations in which the agriculture of the district is interested. Mr. Bailey Denton, a member of this society, I believe, was the first to start draining matches, and I see they are now advertised pretty generally as a feature in the local agricultural meetings. Digging matches, too, are not uncommon at such meetings. I see, too, an offer by a Cheshire Society, which I think deserves to be generally made—"for the invention or improvement of any implement in husbandry, 1*l.*"—thus directing the attention of labourers to the means of facilitating their own work. On the second head, however, *i. e.*, as to the rewards bearing upon good conduct, excepting possibly those relating to benefit societies, and savings' banks, my own both feeling and judgment would be for sweeping the whole affair away, as being generally mischievous and always mistaken. I am entirely ignorant as to what the feeling of this society may be upon the subject, and do not know, therefore, what detail of argument or persuasion may be needed in defence of my position. I may, however, say that it is one which is held by many gentlemen well known in the country generally as agriculturists, and well known by labourers as well as others in their own localities as *good neighbours*. Perhaps sufficient credit is hardly given to those who are for upsetting this system of rewards, not only for the perfect sympathy which certainly they feel in the benevolent object for which this premium system is devised, but also for the experience which many of them undoubtedly possess in all the circumstances and peculiarities of English country life. I could quote a letter which I lately received from Mr. Hope, of Fenton Barns, in East Lothian, a well-known Scottish agriculturist, condemning the practice, which is altogether opposed to the general feeling there, of money rewards for long servitude and so on—but it would be said that he does not understand the circumstances of English village life, and being altogether ignorant of the kind of feeling out of which this practice has arisen, of course his opinion on the subject ought not to influence us. This cannot, however, be said of many an English opponent of the plan, some of whom I hope are present now—and I will be bold to say it cannot be truthfully said even of myself. I have had the good fortune to know something of many English farmers in various grades of intelligence and wealth—from the small occupier up to the leading tenant in a parish. I don't know where any happier picture of intelligent and useful social life could be obtained than was for many years presented in a quiet country village not far from where I lived—where the leading occupier, and therefore leading man in the parish, was an enterprising agriculturist in extensive business—gaining prizes at the local and the country shows—a wise and kind-hearted master, too, winning the affections as well as securing the services of his men—and a Christian gentleman, influencing for good his equals as well as his inferiors.

None who were fortunate enough to be frequent visitors at the hospitable old court-house, which was the residence upon his farm, can be called ignorant of the character of English country life as it is when at its best. This gentleman was, I suppose, the advocate of these money rewards to labourers for good conduct—at least I have, on looking over some old society books, within the last two or three days, seen his name as recommending labourers for such premiums; but I am quite sure it was his personal character alone that made that village what it was—his personal character and that of his family, and not the influence of the Society whose rewards the labourers received, that made them what they were and are. I am afraid you will think that in making this allusion I am running away from the subject, but I have referred to this instance simply in order to show that it is not in ignorance of the relationship of master and servant, as seen on many an English farm, that I hold the opinion I have expressed on the impolicy of the prize lists of many an English Society. I will now state my objections in succession.

(1). The first probably would be—to money rewards or material advantages of any kind as incitements to moral improvement. Of course the morality of any conduct depends altogether upon its motive, and if you say that it has been with the view of gaining this 3*l.*, 2*l.*, or 1*l.* reward, that such a man has supported his impotent father, or punctually attended his parish church, or abstained from crime, or even retained his place upon the farm, or struggled on without parish relief,—then, I say, that compared with another who has done none of these, he is not necessarily the better man of the two. If you say this money is not offered as a prize for competition, but as a reward in acknowledgment of services rendered, then I reply, 1st, it is in effect a prize—for candidates appear, and a few only are successful; and 2d, unless it be a prize, *i. e.*, unless it acts as a stimulant to good conduct in others, it is utterly useless; for this is the professed object of the Society—the promotion of industrious and moral habits among the labouring population.

(2). Let me say, too, that I think this professed object is not sufficiently kept in view, to the entire exclusion of everything else, by some of the societies whose rules I have read. It is not altogether clear, from some of these prizes, that the interest of the occupiers, as much as of the labourers, has not been the leading motive in the offers made. It is a very good thing for the labourer, no doubt, to strengthen the independent feeling which shall lead him to avoid parish assistance, but the offer of money to him, with that end in view, and that, too, by an association of ratepayers, must at the best be a very doubtful method of attaining it.

(3). It may be a good thing (I do not think it necessarily is) to encourage labourers to remain for a length of time in one place, but that is not to be done by a county association; it is to be done by the master himself when he has got a good servant, and by the servant himself when he has got a good master. The thing is as merely private and mutual an arrangement as can be conceived, and it is, I think, placing it in a wrong position to bring it before a public society. It is as much a thing for the benefit of the master as it is for the benefit of the servant; and it is as much a thing to the credit of the master as it is to the credit of the servant. Let them be satisfied with their own mutual advantage and private friendship, which are in themselves their own reward. If any other reward *must* be given, the master deserves it as much as the labourer, and I was glad to see this acknowledged by the Devon Agricultural Society, in whose report of several years ago I read:

> "To the Rev. W. H. Arundell, of Cheriton-Fitzpaine, with whom John Cockram has lived during a servitude of 43 years, a Silver Medal.
>
> "To John Cockram, aged 82, who has lived with the Rev. W. H. Arundell, as above, and has always been strictly honest, industrious, and sober, 1*l.* 10*s.*"

If Mr. Arundell and John Cockram were mutually satisfied with their position, no reward was necessary; if not, then any merit belonging to either must have been that of patience under dissatisfaction. That may have been a proper subject for reward or not.

(4). But even if it was, I cannot believe that rewards of this kind, offered to old age, can have an influence on younger men at the age when character is forming, and when alone such influences are of any use whatever.

(5). They are not only of no use to others, but how paltry and meagre and inadequate, and altogether unfit an acknowledgment they are in the case of the individuals themselves every one must feel. [Instances bearing especially on rewards for good character and faithfulness in service were quoted in proof of this.]

No wonder, I should say, that the competition for these rewards is diminishing; I confess I should think the higher of any district where it had altogether ceased. There is no lack of competition for prizes offered for skill in ploughing, or in other agricultural operations, but there is for those for servitude and for not coming on the parish, and for character. I see at last year's meeting of the Oxton (Derbyshire) Agricultural Society—

> "Thirteen competitors entered at the ploughing match, and 10 for the hedging, but no competition existed for the prizes offered to women for long servitude; and although the names of men receiving prizes under similar circumstances are given, no intimation is given of the number of competitors for the prize."

Their probable influence, however, may be gathered from the following terms, in which one of them is announced:—

> "To the most meritorious labourer.—1st prize, 15*s.*, to William Steemson, 37 years servant to H. Sherbrooke, Esq., and his predecessor; 2nd, 7*s.* 6*d.*, to William Gregory, three years and eight months servant to Mr. Thurman."

It is only fair to add here, however, that I this morning received a letter from the Rev. W. Shepherd, of Margaret Roding, Essex, giving an account of the doings of the Roding Labourers' Friend Society, and that they present a striking exception to the general experience of such societies, so far as I have seen their reports. Indeed, the whole affair presents such an extraordinary picture of what it would appear may be done by means of this kind, when under careful and attentive management, that the notice which it deserves here would be much better from some one who is prepared to defend such means than from myself. He says:—

> "I have been in the almost sole management of the Roding Labourers' Friend Society for 12 or 13 years, and have never found any reason to abate the favourable opinion I entertained of its beneficial operation, both upon masters and labourers. For I do not think the effect is solely confined to the labouring class. I think one great good has been in drawing the employer and the employed more closely together, and thereby more intimately identifying their mutual interests, from which has been fostered a greater kindliness of feeling towards each other, which has, to a great extent, resisted the dissociating spirit of the age. My own feeling on the subject is borne out generally by the farmers of the district; that the workmen are more skilful, they have a more tender regard for character; and they value a good name, especially connected with this Society. I can safely aver that scarcely a prizeman amongst us has ever been found to disgrace the recommendation of his master—based as it is with us on good moral conduct. This is our first requirement, wanting this all other qualifications are as nothing—they are excluded from competition. We have had of late years an average of about 500 certificates yearly, and every certificate is closely scrutinised by an open committee, before admitted to further trial. The prizes are all given in money; in some societies tickets are given, not payable for some days; in others, clothes, or both. My own feeling is, money is the best, accompanied in the principal classes with a memorial of merit. If the man is deserving to be recommended, he ought to be trusted that he will make a good use of his money. If not trustworthy the reward is a mockery. The system is now so generally understood and acted upon that the preliminary committee—the grand jury—are seldom called upon to reject a candidate. That a spirit of emulation is excited and kept up is very apparent; that a man feels himself of more importance after receiving a mark of public approbation is not to be doubted. Every prizeman becomes a public man, and a sense of that adds to his feelings of responsibility, that he should not lose his elevated position. I would add, in reference to length of service (divided into three classes, as you will see in the accompanying bill), we had last year in the old class 35 candidates, whose average length of service was 35 years. In the middle class, 22 candidates averaged 21 years; and the youths, 16 candidates, 10¼ years' service. The previous year presented a similar average, and this, too, after the Society has been in operation 14 years. Our prizes are distributed in the field from a waggon, and the attendance last year, in spite of a drenching rain, was several hundreds of people of all classes."

I have thought it fair to read this letter, as of course I want to obtain a victory only for the truth in this matter. My own opinion in reference to such a case as this is, that it is the personal influence of such a man as Mr. Shepherd, and not that of the association, that is here the really acting cause of the success. Or if that be not strictly the state of the affair, that, at any rate, it is personal and not society influence that produces the result. It is not a county society—it includes but two or three parishes—the candidates are known to one another, and to the men who are assembled to reward them, and I can imagine a prize and testimony to character under such circumstances to be valued by labouring men, when one of a merely official character, such as would be awarded by a lot of strangers, would be valueless. Be that as it may, I suppose Mr. Shepherd's experience ought to have some influence on our decision, and I therefore give the account as he has forwarded it to me.

It does not at all alter my opinion as to the much lower status of the labouring men in a district where those rewards are sought, than in one where they would be despised. The question raised as to the men being *trusted* with money rather than clothing, I think confirms this view. It is somewhat as if they were a lot of children, good indeed, but still whom it was advisable to keep out of these little temptations. Certain it is that no rewards of such a kind, or of any kind, are offered in East Lothian, for instance, where, if they *were* offered—I allude to those for large families of legitimate children, and for benevolent attention to impotent relations, and for abstinence from parish relief—they would be looked upon as a positive insult; and yet in East Lothian Mr. Stevenson bears this testimony to the character of the working men:—

> "Nowhere does there exist more of that community of feeling and that friendliness of relation, which ought to subsist between the employers and the employed, than in this county. The servants not only occasionally suggest improvements, but endeavour to carry out what is novel, whether in the adoption of new implements, or of what is new in practice. On some farms the same families have sustained the relation of master and servants for, at least, two generations, and it may be mentioned as a striking proof of the general trustworthiness of the men, that a considerable proportion of the grain is sold by *them* in the stock markets—they giving delivery and receiving payment. We have heard of one instance only where this trust was misplaced—every sixpence of the money being always faithfully accounted for."

Now, of course, English management must be adapted to English circumstances. But I think it deserves the grave consideration of the managers of our labourers' friend societies, whether they shall adopt a system which does, I submit, tend to stereotype the present position of our men, which is that of obedient and almost child-like dependence when they are good, and, of course, therefore, ignorant and reckless blackguardism when they are bad; whether, on the contrary, they ought not to aim rather at the encouragement of manly self-reliance, not only in the matter of personal support, but in intellectual standing and mental independence, without which all other sources of independence are but artificial props undeserving of our confidence. Such are the props, in my opinion, supposed to be erected by these prizes for long servitude, and for not coming on the rates.

I will make a last remark on this point, in answer to an objection which may perhaps be raised. It may be said—

> "You are altogether mistaken in the character of these rewards—no one thinks of them as prizes except yourself. They are testimonials of respect—expressions of goodwill and gratitude—certificates of character—or what else you please; they are not premiums or rewards for good behaviour. A master has had a servant for years in his own service and that of his father before him—sincere esteem has long been entertained for his character, and gratitude for his services; he looks about for some way in which to express the sense he entertains of his value as a servant, and of his character as a man, and he finds no way so well adapted for the purpose as recommending him to the notice of the county association which stands there ready to his hand.'

Now, in answer to that, I take it that the gratification of the employer's gratitude and the improvement of the labourer's character, are two entirely distinct objects. If I were asked to subscribe to any such county association, and were convinced that the latter of these objects was likely to be forwarded by the methods it employed, I would heartily lend what assistance I could; but if I were told it was a machinery which had little more than the effect, whatever its proposed object might be, of providing amongst a number of members the work of expressing the gratitude of a few of that number, I should certainly have nothing to do with it. Surely if any one feels this gratitude, he is bound to express it himself without the assistance of a society.

I hope nothing that has been said will appear as if spoken either in ignorance or in disregard of the real worth of character one often finds amongst agricultural labourers, and *especially*, I would say, among those who have been long in the service of the same family. It is because its worthiness is high above, and altogether out of, the field of £ *s. d.* considerations, that I would do away with these money rewards; and it is because its influence is unaffected by society certificates of abstinence from crime, or from parish relief (apparently the next worse thing)—of length of servitude, freedom from

intoxication, and so on, that I would leave our labouring men to the rewards of conscience, and to the respect of friends and neighbours, as the natural and only proper testimonial—one, however, which a long and useful life will always insure for them.

There will be plenty of scope for our labourers' friend societies though all the money rewards for good behaviour were swept away—all rewards for skill of course should be retained, and for the rest they cannot do more for the interests of the labourer than by encouraging enterprise amongst the farmers. If 12 tenant farmers, Mr. Mechi's neighbours, were locked up till they should arrive at a verdict upon the agricultural merits of Tiptree Hall farm, it is possible that they might sustain some considerable length of imprisonment; but place 12 of the labouring men of Tiptree Heath in that position, and I will engage their foreman shall have their verdict ready in five minutes.

There can be no doubt that agricultural energy and enterprise are greatly for the benefit of the agricultural labourer. That I can say from some experience, for I will claim this credit for the Whitfield so-called example farm, that the character of the labourers in its neighbourhood has greatly altered for the better, as the result directly and indirectly of its establishment. The blackguardism of that neighbourhood is very much reduced; the public-houses are the places for information about that, and they will tell you; the game-keepers will report less poaching; the shoemaker, baker, grocer, make a better living than they used; cottages are improved, and their inhabitants are improved as well—evenings are spent in the allotment grounds that used to be spent in the tap-room—and friendly societies and savings' banks, and building societies, have increased their hold upon the people — and yet no labourers' friend society that I know of has ever done anything for that neighbourhood —no money reward for long servitude that I have ever heard of has been received by any person in the place—nor has any one been encouraged to maintain his independence by the offer of a prize to him who should bring up the largest family without assistance from the parish. The facts are these—a greater quantity of labour has been employed, and wages have been paid as much as possible by the piece; and for the rest, thanks to the wise benevolence of the late Earl Ducie, a chapel and a school-house were erected, and day and Sunday schools established; and influences there were put in exercise, compared with which, in their effect upon the rising young men and women of that neighbourhood, any system of money rewards offered, whether for servitude or independence, can be little better than a mockery. Apart from the strictly agricultural societies, I would regard the British and Foreign School Society and the National Society, and probably the Emigration Commissioners, as the three best labourers' friend societies which have yet been seen. They have all had a hand in the alteration for the better which the neighbourhood of Whitfield example farm exhibits—indirectly, as I have said, as the result of its establishment.

I would urge, in conclusion, that every local labourers' friend society should endeavour to encourage education within its limits; that it should encourage the operation of benefit societies and of savings' banks, and especially of that best of all savings' banks for the employment of scraps of time—the allotment system; that it should avoid everything having a pauperising or dependence-producing tendency, keeping in view the maxim which involves a most important truth in material things, as well as in others, that "to him that *hath* shall be given;" that on this ground it should devise means for encouraging the payment of wages by the piece; that it should try to guide and *possibly* to encourage the spirit of emigration in its district; that it should direct its chief attention to the offer of rewards for evidence of skill, whether in agricultural, horticultural, or more domestic operations; and, lastly, that it should abstain from all attempts to influence, by money rewards, such matters as attention to religious duty, benevolence, or personal morality, where higher motives alone ought to have an influence. I shall be exceedingly glad if any experienced member of this Society shall see his way to the proposal of a resolution having especial reference to the last of these points.

A lively discussion ensued; Mr. Acton referred at some length to the advantages of benefit societies and savings' banks, and contended for the advantages of the rewards offered for good conduct as a nest egg of encouragement to prudence and economy. He also deprecated the reference to rewards for good conduct as having no moral influence.

Mr. Nesbitt agreed with Mr. Morton's remarks on rewards for personal morality. Prizes might be usefully offered for physical and intellectual superiority, for man could judge with certainty of these; but real moral standing was a thing which he could not judge, and therefore could not justly reward.

Mr. Mechi believed that these societies commenced at the wrong end. They ought to educate the children and the young men, and not to offer rewards for good conduct to old age. He referred to the apathy prevalent in agricultural districts on the subject of education, saying that in his own parish of 7000 acres a 3*d.* road rate would yield 80*l.*; but the whole contribution per annum for education within that district was 15*l.* a year. The ignorance of the agricultural labourer reacts on the farmer in every way. Very often a man's ability to improve his management was limited, not by the extent of improvement in agricultural machinery or science, but by the trustworthiness and intelligence of his workmen. He believed, too, that the agricultural labourer would be greatly improved by everything that tended to attract capital to agriculture.

Mr. Baker, of Writtle, entirely agreed with Mr. Mechi on the subject of education, and as to the present system of rewards, as beginning at the wrong end. An educated man might be a man with more wants, but in an even greater degree he possessed the means of satisfying those wants. He adverted to the usefulness of these societies in the promotion of skill.

The Chairman agreed with much that had been said in the opening paper, but thought it had been written in a strain of irony and depreciation, as regards these societies, which, he contended, they did not deserve. Before they condemned them, they should remember what a large proportion of their attention was devoted to the promotion of increased skill; and as to the rewards for struggling against parish relief, and for good conduct in general, he knew as a practical man that in his own locality they had been productive of great benefit. Other gentlemen followed on the same side, referring to the annual meetings of these societies, the union of all classes in a common object, the addresses of the clergymen present, the pleasure evidently felt by all, as opportunities of real usefulness which it would be the worst policy to abandon.

Mr. Morton replied that no one in that room had spoken more highly of the benevolent object of these societies than he had done himself. The only question was as to the best way of attaining it. He believed that money rewards for benevolence to relatives and for personal morality had a mischievous tendency, and hoped the resolution arrived at would condemn them.

It appeared, however, to the majority that it was unadvisable to pass any condemnatory resolution whatever, and Mr. Baker at length framed one, which was agreed to—stating the proper object of labourers' friend societies to be the promotion of good conduct and agricultural skill, and that in order to its attainment they should endeavour to promote education within their respective districts, and by means of rewards to excite emulation in the skilful performance of agricultural operations.

Miscellaneous.

The late Mr. Milburn, of Sowerby, near Thirsk.—We very deeply regret to hear of the sudden death of Mr. Milburn, the secretary to the Yorkshire Agricultural Society. Mr. Milburn was well known in the agricultural world as an able contributor to its periodical literature; in his own county he was highly esteemed, both in his profession as a land-agent, and in connection with the county agricultural society, as a most zealous and efficient office bearer; while in his immediate neighbourhood, he was loved and honoured for his benevolent efforts for the good of labourers and others.

Calendar of Operations.

JUNE.

CHESHIRE, *June* 7.—Since our last report, the weather, with very few exceptions in certain localities, where heavy thunder showers have fallen, has been exceedingly dry; consequently there is, generally speaking, a scarcity of Grass for the cattle, and the prospect of short crops of hay; Potatoes and Mangold Wurzel, too, have come up irregularly, and are much retarded in their growth by the dryness of the weather; and the same remarks will apply to late-sown Barley and Oats. The Wheat crops, although thin on the ground in many places, are much improved, and, on the whole, look very promising. The weather has been favourable for working the Turnip fallows, and the generality of farmers have completed their Swede sowing satisfactorily, and are now only wanting a little rain to place their crops in the position they would wish them to be. Good beef has become very scarce, and is consequently commanding an unusually high price. Potatoes also are very scarce and dear in the markets—as much as 9*s.* per bushel of 90 lbs. was obtained last week—and new ones, it is to be feared, will be later, and a worse crop than usual, in consequence of the frosty nights about the 24th April, and a continuance of the dry weather. Ewes and lambs have done much better lately than they did about the end of April and beginning of May, at which time there were great losses from disease, bowel complaints, &c. *N. C.*

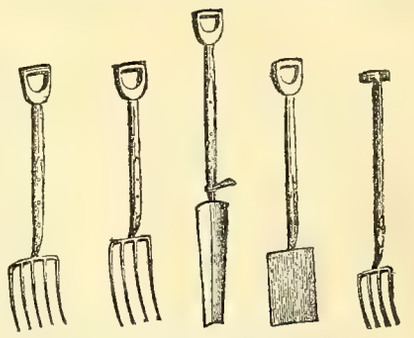
WESTER ROSS, *June* 4.—The whole country has been visited with abundant showers. The wind throughout last month was generally easterly, and the weather cold, so that Grass that was early eaten off with sheep or cattle has made little progress, and is now somewhat bare. Warm weather, however, has set in, and having abundant moisture, we may expect rapid vegetation. Wheat has been making astounding progress, and bids fair to be a luxuriant crop. Indeed in some places it is likely to overshoot the mark; and every farmer knows that a much lodged crop of Wheat is anything but a satisfactory yielding one. Harvest is still at a respectable distance, and ere it arrives we may expect many alternations, and have a different report to make. Little more can be said of Barley and Oats at this early stage than that they have set out gracefully and vigorously, and will, with an ordinary season, yield an abundance of corn and straw. Potatoes are generally coming above ground, and exhibiting a regular and healthy braird. From the breadth planted, the dependence upon it, and the bright anticipation of a golden harvest (anticipations if not origluated, certainly greatly strengthened by the experience of the past year), the eye of the farmer will be oft turned towards this very interesting, but extremely precarious, part of his crop. Swedish Turnip sowing has been concluded. The better time for sowing this part of the crop, in this quarter, is from the middle of May to the beginning of June. The quantity of these now sown is greatly increased. They are found to possess a larger proportion of fattening substance than common Turnips, and consequently are better suited for feeding off the bigger cattle. They are also found to be excellent feeding for horses, even in their raw state, and horses accustomed to them will eat a large quantity, and thrive admirably upon them. They require a larger quantity of manure than the common sorts; but when abundantly manured, and early and regularly brairded, they seldom fail in yielding a heavier crop than the ordinary kinds. Different farmers give very different quantities of manure to their Turnips. It is evident that with a small quantity the crop cannot be abundant; but it is nearly as clear that a superabundant supply will not make the crop correspondingly large. Should the manure given be suitable, then the rate at which the crop absorbs and assimilates that manure depends entirely upon the nature of the season. If the quantity given be enough to supply the wants of the plant throughout the whole growing season, then the crop will be as large as if the quantity of manure had been double; only with the large application there is something left over to a coming crop. A sufficient dose for Swedes would be found within this range—from 10 to 20 loads of manure per acre, from 6 to 10 bushels of bones, and from 1 to 2 cwt. of guano. Everything here is rising rapidly in price, from the wages of the workman down to the boll of lime. Lime that cost us last year 2*s.* is this year 2*s.* 9*d.* The farmer will by and bye find use for all his high prices. Wages of women for out-door work have risen from 6*d.* to 8*d.* per day—not certainly extravagantly high yet.

Notices to Correspondents.

GRASS: *J H* says:—I am shortly about to leave this country to take possession of a sheep run of 10,000 acres in New Zealand, a place that I have already visited, as well as Australia. The run I have selected possesses many advantages, but it is rather small for my purposes. Will any of your subscribers tell me whether seeds thrown broadcast over the land, the native Grass being first burnt, the land not broken up, will improve the herbage sufficiently to induce me to incur the expense; and, in such case, what quantity, reference being had to the expense and difficulty of carrying it up the country some 50 miles, it would be advisable to throw on the land per acre. [If 12 to 20 lbs. of suitable seed per acre were sown broadcast, just before rains, they might influence the character of the pasturage.]

SEA SAND: *R M.* It will not be advisable to cart sand to the farm buildings and use it as bedding. Unless it be calcareous it is not in itself of any worth, and it is not absorbent enough; and in all these particulars, therefore, it is inferior to dry peat dust.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

WEIR'S IRRIGATORS, LIQUID MANURE PUMPS, FIRE AND GARDEN ENGINES.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London, removed from Oxford Street.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

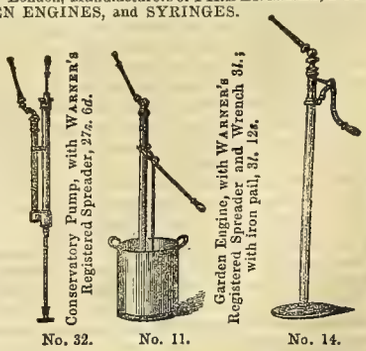
JOHN WARNER & SONS,
8, CRESCENT, JEWIN STREET, LONDON.
Every description of Machinery for Raising Water: Fire Engines, &c.

JOHN WARNER AND SONS,
CRESCENT, JEWIN STREET, LONDON.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader,

Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.



Conservatory Pump, with WARNER'S Registered Spreader, 27s. 6d.
Garden Engine, with WARNER'S Registered Spreader and Wrench 3l.; with iron pail, 3l. 12s.
Patent Conservatory Pump, with WARNER'S Registered Spreader, 2l. 13s.; with iron pail, 3l. 5s.
No. 32.
No. 11.
No. 14.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists, for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

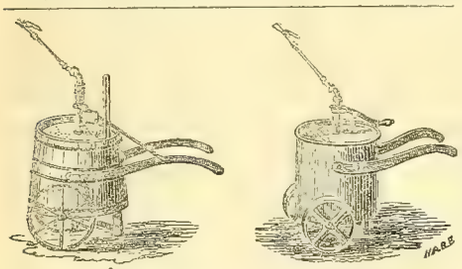
No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.
Fountains suitable for Conservatories, Lawns, &c.
Sheets of Engravings sent on application.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, HYDRAULIC ENGINEER, 70, Strand, and Bridgefield, Wandsworth.



(Fig. 1.) (Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds 8 gallons, throws 25 feet high						...	£2 15
No. 13	„	12	„	„	30	„	... 3 5
No. 11	„	16	„	„	40	„	... 4 0
No. 12	„	24	„	„	45	„	... 5 0
No. 14	„	30	„	„	45	„	... 5 18

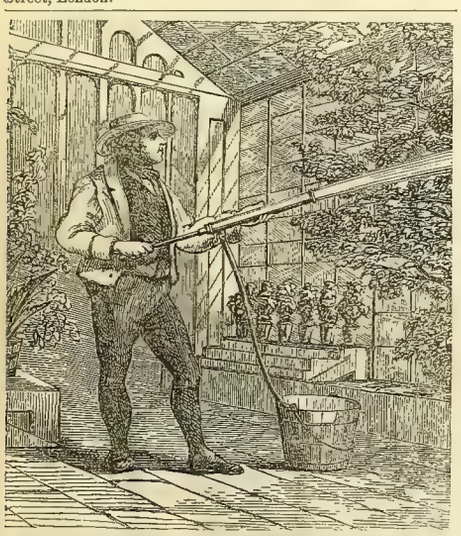
A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.



J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

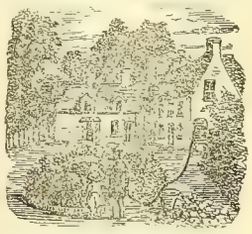
By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, ETC.

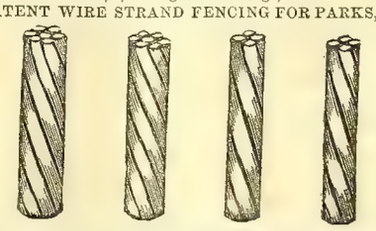
JAMES LYNE HANCOCK'S VULCANISED INDIA-RUBBER TUBING is now manufactured especially for the above purposes, and is of greater flexibility than any other description of hose or tubing. It is also manufactured to resist great pressure, suitable for attaching to the mains of water works or to tanks, or water butts of high elevations. WATERING HOSE fitted up with brass joints, branches, stop-cocks, roses, and jets complete. Vulcanised India-rubber suction pipes for pumps any length or size to order; HOSE for brewers' use, fire engines, &c. VULCANISED INDIA-RUBBER WASHERS, for Steam and Water Joints, and VULCANISED RUBBER in sheets of any size and thickness. Solid vulcanised India-rubber Tubing and Cord, for the joints of glass-doors, sashes, frames, &c.—Prices and every information may be had on application at the Manufactory, Goswell Mews, Goswell Road.



THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

H. J. MORTON AND CO., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

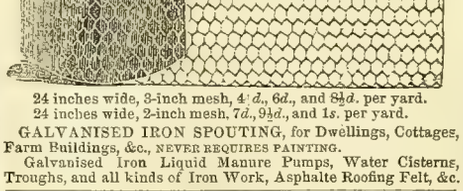
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

H. J. MORTON AND CO., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.

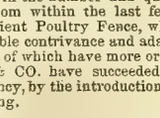


24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.

GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.

Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

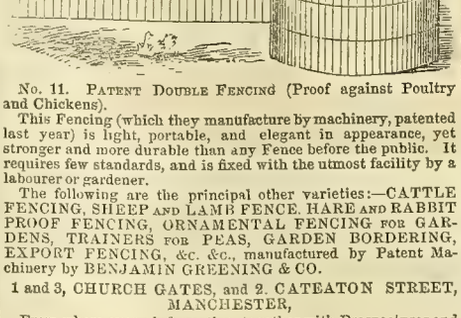
BY HER MAJESTY'S ROYAL LETTERS PATENT.



AGRICULTURAL AND POULTRY FENCING, MANUFACTURED BY PATENT MACHINERY.

The great increase in the number and quality of POULTRY in the United Kingdom within the last few years has created a demand for an efficient Poultry Fence, which has called into existence every possible contrivance and adaptation of the Wire and Cord Netting, all of which have more or less proved failures.

B. GREENING & CO. have succeeded in supplying this acknowledged deficiency, by the introduction of a variety of their Portable Wire Fencing.



No. 11. PATENT DOUBLE FENCING (Proof against Poultry and Chickens).

This Fencing (which they manufacture by machinery, patented last year) is light, portable, and elegant in appearance, yet stronger and more durable than any Fence before the public. It requires few standards, and is fixed with the utmost facility by a labourer or gardener.

The following are the principal other varieties:—CATTLE FENCING, SHEEP AND LAMB FENCE, HARE AND RABBIT PROOF FENCING, ORNAMENTAL FENCING FOR GARDENS, TRAINERS FOR PEAS, GARDEN BORDERING, EXPORT FENCING, &c. &c., manufactured by Patent Machinery by BENJAMIN GREENING & CO.

1 and 3, CHURCH GATES, and 2, CATEATON STREET, MANCHESTER,

From whom every information, together with Prospectuses and Engraved Sheets of Patterns, may be obtained gratis.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES, GREENHOUSES, DWELLINGS, ETC.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

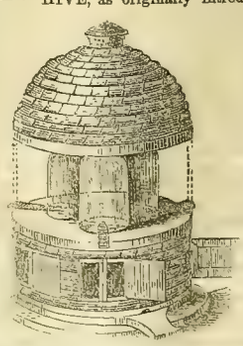
DEANE, DRAY, AND CO. are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with their Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom. Also wholesale and retail Agents for SAYNOR'S celebrated PRUNING KNIVES, used exclusively by the first Gardeners in the United Kingdom.

DEANE, DRAY AND CO. (Opening to the Monument), London Bridge. ESTABLISHED A.D. 1700.

BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.



This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

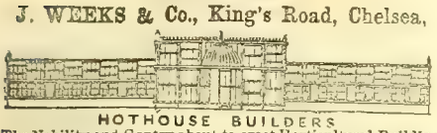
Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, F. & A. DICKSON & SONS, 106, Eastgate Street; Glasgow, AUSTEN & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

GREENHOUSES.

HENRY FREEMAN, Hothouse Builder, and Hot Water Apparatus Manufacturer, Triangle, Hackney, begs to solicit the attention of the Gentry to his prices for cash. Good substantially built Greenhouses, fixed in any part of the kingdom, 42 feet long, 13 feet wide, 9*l.*; 21 feet by 13 feet, 5*l.*; 12½ feet by 10 feet, 3*l.* A large assortment of Melon and Cucumber boxes, summer houses, &c. Estimates for any branch in the above line either in iron or wood, or park fencing.

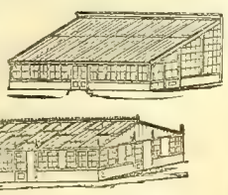
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

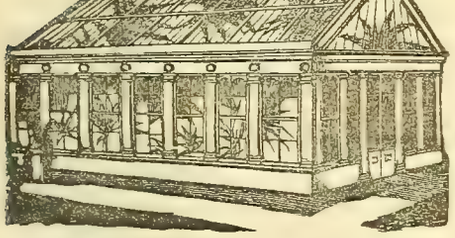
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings: also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. Weeks & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

At the Lowest Prices Consistent with Good Materials and Workmanship.



GRAY and ORMSON, Danvers Street, Chelsea London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

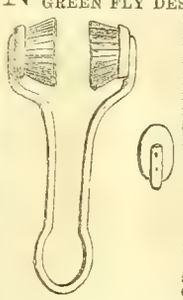
E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

IMPORTANT TO GROWERS OF ROSES.

NEWLY-INVENTED APHIS BRUSH, or GREEN FLY DESTROYER.—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the Rev. E. S. Bull, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage. Price 2*s.* 6*d.* each.



Manufactured by

JOSLIN AND SONS,

Ironmongers, Colchester.

Retailed by all the principal Ironmongers.

Wholesale agents: W. Thompson and Son, 15, Upper North Place, Gray's Inn Lane Road, London.

PAGE and CO.'S COMPOSITION FOR THE DESTRUCTION OF MILDEW UPON VINES, BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, AND STOVE AND GREENHOUSE PLANTS.—Extra strong, 4*s.* per gallon, sufficient to make four (jars and barrels extra); in bottles, 1*s.* 3*d.* and 2*s.* 6*d.* each. 10 gallons and upwards carriage free to London. Directions for use and copies of testimonials upon application. For testimonials see whole page *Gardeners' Chronicle*, March 11, 1854, describing the satisfactory results derived from its use in cases of Vine Mildew, Thrip, Scale, Green Fly, Red Spider, Mealy Bug, &c., not only without injuring the most delicate flowers or foliage, but promotes a vigorous growth; it is highly appreciated at the Royal Gardens, Osborne Palace, the Royal Gardens, Claremont, and by the principal nobility and gentry in the United Kingdom.

Finest Grasses for Lawns and Parks, and every variety of Garden and Farm Seeds, at B. Page & Co.'s, Seed Merchants, Oxford Street, Southampton.

MILDEW AND RED SPIDER.

BAINBRIDGE ALKALINE EXTRACT.—We can confidently recommend the above as a sure remedy, having used it successfully for many years both on Vines and Peaches, &c. &c. Pints, 3*s.*; quarts, 5*s.* A quart is sufficient for 20 gallons of water applied with the Syringe.

BAINBRIDGE GUIDE TO THE CONSERVATORY, 5*s.* each. Sold wholesale and retail by R. Baldwin, Paternoster Row. Gentlemen can procure the above in any part of the country through their Bookseller, in their Monthly parcels.

Sold also by Bainbridge & Hewison, 7, Bridge Street, York.

PROTOXIDE ANTI-CORROSION PAINT, for all external purposes, on iron, wood, brickwork, or stucco, is cheaper, and more durable, than any similar article.—Manufactured by Charles Francis & Sons, Cement Works, Nine Elms, London.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit William S. Burton's SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 2, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

William S. Burton has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1 and 2, Newman Street; and 4 and 5, Perry's Place.

100 ALDERNEY COWS AND HEIFERS.

JAMES DUMBRELL respectfully invites purchasers of Alderney Cows to inspect his stock. Choice from 100.

James Dumbrell, Ditchling, Hurstperpoint, Sussex, one mile from Hassock's Gate Station, London and Brighton Railway.

Apply at the city of London Wire Works, 44, Skinner Street, London. N.B. Fowl Houses, Chicken Coops, Poultry Hurdles, and Netting, of every size and description. Illustrated Catalogues forwarded, post free, on application. A few Spanish Pullets, sisters to those sent to her Majesty's yard at Windsor, for Sale.

Sales by Auction.

ORCHIDS.

Established Plants of the Greatest Rarity.

IMPORTANT TO AMATEURS.

MR. J. C. STEVENS is directed to Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, June 22, at 12 for 1 o'clock, Magnificent SPECIMEN PLANTS from a Gentleman's collection, including amongst others the following very great rarities:—Aerides Larpentæ, Schröderi, quinquevulnerum, and maculosum; Vanda suavis (Veitch's true), Saccolabium guttatum splendens, Cymbidium eburneum, Cypripedium Lowi, Odontoglossum nævium, and many choice Phalænopsis, Cattleyas, Anguloas, Dendrobiums, &c. Also, a small importation from the East, containing a distinct new Aerides, and some recently imported plants from Guatemala and Venezuela.—May be viewed on the morning of Sale; and Catalogues, which are preparing, will be forwarded in due course.

BLACKHEATH.

To Gentlemen, Nurserymen, Florists, and Others.

MESSRS. PROTHEROE and MORRIS are directed by Mr. Thompson, to Sell by Auction, without reserve, on the premises, West Point Nursery, Blackheath, on WEDNESDAY, June 14th, at 11 o'clock, in consequence of the ground being let for building, the whole of the GREENHOUSE and BEDDING PLANTS, consisting of Show and Fancy Pelargoniums, Camellias, Orange and Lemon Trees, Cactus; also a large quantity of Scarlet Geraniums, Fuchsias, Hydrangeas, Verbenas, Cytisus, Chrysanthemums, Pentstemons, Lobelias, Anagallis, Cuphea, Calceolarias, Deutzias, Petunias, Dahlias, Roses in pots, Jasmine, Clematis, Vines, Lilium lancifolium, Rubrum, Album, &c., &c.—May be viewed prior to the sale; Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on FRIDAY, June 16th, at 12 o'clock, a first-rate collection of DAHLIAS, FUCHSIAS, VERBENAS, PETUNIAS, CLIMBING, and other ROSES; also a selected assortment of Geraniums, and other Plants in bloom, with a quantity of Ornamental Plants for bedding.—May be viewed the morning of Sale; Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

DOWN COTSWOLD RAM LAMBS.

MESSRS. GODWIN and SON are instructed by Mr. J. T. Twynam to offer for Sale by Public Auction, at the Corn Exchange, Winchester, on MONDAY, July 17, at 2 o'clock precisely (the day previous to the Great Overton Hampshire Lamb and Sheep Fair, about Forty prime RAM LAMBS, and Three Four-teeth RAMS, of the above valuable breed, now so rapidly rising in public favour. These Lambs are of great size, of one uniform brown or dark colour of face and legs, and possess the most complete amalgamation of the Down and Cotswold symmetry, fleece, and flesh. The sire is (chiefly) Mr. Druce's (of Ensham, Oxford) No. 7 Down Cotswold Ram, a sheep of beautiful mould and thick flesh; the dams descended from the well-known flock of Down Cotswolds, established by Mr. J. T. Twynam, at Whitchurch, in 1835. Mr. Druce's wethers took the first prize at Smithfield at the last Christmas Exhibition for Crossed Sheep, in class 23. Winchester offers every facility and convenience for gentlemen and dealers who intend visiting the Fair at Overton on the following day.—The Lambs can be seen and particulars obtained on application to J. P. Twynam, North Walls, Winchester.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

ORCHARD HOUSE CULTURE.

T. RIVERS will have much pleasure in showing his ORCHARD HOUSES to any one interested in this interesting mode of cultivating Fruits. The Harlow Station is the most convenient for the Nurseries, and a train leaving Bishopsgate at 11.30 the most eligible.

Nurseries, Sawbridgeworth, Herts.

HONEYSUCKLE VERBENA.—So named for its delightful perfume, which is so near the odour of the Honeysuckle that it cannot be distinguished from it. Last season it was the constant inquiry of visitors at the Nursery Grounds if Honeysuckles were growing near, or what flower so much resembled them in fragrance, and on being informed it was the above new variety of Verbena, they were much surprised, and immediately ordered plants of it.—Description—viz.: Compact habit, fine glossy foliage (will do excellently for bedding, or as a plant for pot culture), long stems to flowers, making it very useful for bouquets—blooms most abundantly; colour rich dark crimson, shaded lilac, very distinct eye; the truss of a fine globular shape, generally measuring 9 inches in circumference, all the pips fully expanded. It will force well during the winter, being a great advantage for cutting, or for its perfume in a greenhouse or conservatory at that season of the year; it will also stand the sun and rain during summer better than any other Verbena. A few blooms added to a bouquet will give it the scent of the sweetest Honeysuckle. Fine strong plants are now ready for sending out, at 5*s.* each.

LOBELIA LINDLEYANA.—The Subscriber having purchased the whole stock of the above new Lobelia of Mr. Keynes, Salisbury, he begs to offer it to the public. It was awarded a Certificate of Merit at the Horticultural Society and National Society of London, June 1853. Description—viz.: Habit, dwarf and compact, flowering very freely, covering the whole surface of the plant; distinct in colour from all others yet out, being a bright rosy lilac. It is an excellent bedding variety, and will be sure to please every one who grows it, especially for its distinct colour and profusion of bloom. Strong plants now ready at 3*s.* 6*d.* each.

The usual allowance to the Trade when three plants of either are ordered. On receipt of a post-office order or penny postage stamps to the amount, the plant or plants will be sent postage and package free.—EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somerset.—June 10.

RICK CLOTHS, MARQUEES, TENTS, ETC.,

NEW OR SECOND-HAND, FOR SALE OR HIRE.

BENJAMIN EDGINGTON has, for the ensuing season, an extensive assortment of Marquees, &c., for Horticultural Societies, Fêtes, Cricket Clubs, &c. Rick Cloths, with poles, pulleys, and lines complete. A variety of Emigration Tents erected on the premises, No. 2, Duke Street, Southwark Netting and Bunting for Fruit Trees.

Warehouse, 32, Charing Cross, where Tents are erected. Address by post, No. 2, Duke Street, Southwark.

RIPE FRUIT, STRAWBERRIES, AND SEED BEDS.—New Twined Netting (tanned if required), 1 yard wide, 1½*d.* per yard; 2 yards wide, 3*d.* per yard; 4 yards wide, 6*d.* per yard; ½-inch mesh do., 2 yards wide, 6*d.* per yard. The Elastic Hexagon Garden Netting, 76 meshes to the square inch, effectually excludes birds, wasps, flies, &c., from fruit trees, flower or seed beds, 4½*d.* per square yard. Tanned Netting, 2 or 3 yards wide, 1½*d.* per yard; 4 or 6 yards wide, 3*d.* per yard, exactly the same as advertised by others at double the above prices. Coir or Hemp Sheepfolding Net, of superior quality, 4 ft. high, 4*d.* to 6*d.* per yard. Lamb Net, 6*d.* per yard. Rabbit Net, 1½*d.* per yard, 4 feet wide; each edge Corded, 2*d.* per yard, suitable for fowl fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for fencing against fowls, cats, &c.

The largest, cheapest, and best stock in the world, at W. CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond Road, Kingsland, London; and at the Crystal Palace, South West Gallery, Sydenham. The Trade supplied. Orders by Post punctually attended to. Fishing Nets of all kinds in stock.

COWS.

HARVEY'S CELEBRATED COW DRINKS 1*s.* each. They have been used with unparalleled success in most diseases incidental to Cows. Full and plain directions are given with each drink for the treatment of Hoven, Maw-bound, Colds, Gargle, Red Water, the Tick or Foot and Mouth Distemper, at and after Calving, &c. A very extensive use of these drinks has proved them to be a safe and effectual remedy.

Compounded by R. HARVEY, Veterinary Surgeon, Macclesfield, Cheshire, and sold by all Medicine Vendors. Wholesale Agents, BARCLAY & SONS, Farringdon Street; and MARSDEN & SONS, Queen Steet, Cheapside, London.

Bristol, June 17.

EXHIBITION OF AMERICAN PLANTS,

ROYAL BOTANIC GARDENS, REGENT'S PARK.

JOHN WATERER begs to invite the attention of the nobility and gentry to his unrivalled Collection of RHODODENDRONS, &c., which are now in full bloom.

The celebrated new hardy Scarlet Rhododendron JOHN WATERER is now in perfection.

Admittance obtained by Orders from Fellows of the Society.

The American Nursery, Bagshot, Surrey.—June 17.

EXHIBITION OF AMERICAN PLANTS AT KNAP HILL NURSERY, WOKING.—

The American Plants at this Nursery are now in bloom, and may be seen daily gratis. The Knap Hill Nursery is within an hour's ride of London, by South Western Railway to Woking, where all trains stop, and from whence capital conveyances may be obtained.—WATERER & GODFREY, late HOSEA WATERER.

CHIVAS'S ORANGE JELLY TURNIP.

SUTTON AND SONS, Seed Growers, Reading, can supply new Seed direct from Mr. Chivas at the same price as at Chester; they have also themselves grown some excellent Seed from selected Orange Jelly Turnips raised last year from seed received of Mr. Chivas, which they can strongly recommend. Purchasers of large quantities will be supplied liberally. Particulars, on application.—Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

THE FORWARDEST TURNIP KNOWN.

SUTTON'S EARLY SIX WEEKS TURNIP should now be sown for feeding off early. Excellent new Seed 1*s.* 3*d.* per pound, or 7*s.* per gallon.

Mr. K. HICKMAN, of Brompton House, near Newbury, in a letter dated February 1st, says:—

"*I must mention the 'Six Weeks Turnip' as the best sort I have ever seen for earliest and latest sowing. I have grown them several years, and have invariably found them to produce more feed in less time than any other Turnip. I have had them after Wheat of a good size, within six weeks from the time of sowing.*"

N.B. Carriage free except parcels under 20*s.* value.—Address, J. SUTTON and SONS, Seed Growers, Reading, Berks.

THOMAS WELLAND, Surrey Gardens, Godalming, Surrey, has to offer the following:—True CATTLE DRUMHEADS; also Fine Spring-sown EARLY BATTERSEA PLANTS, packed and delivered at Godalming Station, at 3*s.* 6*d.* per 1000, and sent to order into any county in England, Scotland, Ireland, and Wales.

NEW BEDDING CALCEOLARIAS.

EDWARD GEORGE HENDERSON & SON, of the Wellington Nursery, St. John's Wood, London, are now sending out their splendid Bedding Calceolarias—Loveliness, Masterpiece, Matchless, Superba, and Surprise. These (the finest and most distinct in this class) were purchased of Mr. Constantine, who exhibited them at Chiswick in 1853. Price 7*s.* 6*d.* each, or 30*s.* the set, with the usual allowance to the Trade. The Plants are fine bushy stuff.

CINERARIA SEED.

EDWARD GEORGE HENDERSON AND SON, Wellington Nursery, St. John's Wood, London, are now prepared to forward, by post, new Cineraria Seed saved this season. More than usual care has been bestowed in gathering from the choicest named varieties, including the new ones sent out last year; all the light varieties have been discarded, consequently from the above seed we anticipate none but high coloured flowers. Per packet, 2*s.* 6*d.* and 5*s.* each.

Our beautiful collection of CALCEOLARIAS can now be seen in flower at the Nursery, and orders for seed booked, to be sent when ready. Per packet, first quality, 5*s.*; second quality, 2*s.* 6*d.*

BASS AND BROWN'S NEW POTENTILLAS.—

In consequence of the limited stock of King of Crimsons, we regret we must decline receiving more orders. The following are now ready to send out:—

Potentilla Sudbury Gem, each	10*s.* 6*d.*	Potentilla Theodore, each	7*s.* 6*d.*
„ Shylock, do.	10 6	„ Julia, do.	7 6

The following, 16*s.* the set of seven varieties:—

Floral Beauty	3*s.* 6*d.*	Scarlet Gem	3*s.* 6*d.*
Napoleon	2 0	Primrose	2 0
Defiance	2 0	Argo	2 0
Negress	3 6		

For descriptions and editorial remarks, see *Gardeners' Chronicle* of March 13, p. 144, and April 1, p. 208.

Seed and Horticultural Establishment, Sudbury, Suffolk.

CHEAP BEDDING PLANTS.

JOHN MORSE begs to offer the following in good strong Plants, at 3*s.* per dozen, showing bloom.

Heliotropium corymbosum	Lobelia fulgens multiflora
„ Triomphe de Liege	„ Erinus ramosoides
„ Peruvianum	Anagallis, blue and red
„ Voltaireanum	Neirembergia gracilis
Calceolaria Sultana	Verbenas, in great variety
„ Sulphurea splendens	Petunias „ „
„ Amplexicaulis	Dahlias „ „
„ Floribunda	Fuchsias „ „
Lobelia Queen Victoria	Scarlet Geraniums „

Also a few dozens of the following beautiful Geraniums, strong, in 4-inch pots:—

Mountain of Light	12*s.* per doz.
Flower of the Day	7*s.* „
Cerise Unique	5*s.* „

No charge for Hampers or Package.

JOHN MORSE, Nurseryman, &c., Dursley, Gloucestershire.

NEW ROSES IN POTS, at reduced prices.

HYBRID PERPETUAL.		HYBRID PERPETUAL.	
Baronne de Kermont	5*s.* 0*d.*	Souvenir de Mdme. Lille	5*s.* 0*d.*

The following choice Hybrid Perpetual Roses, at 30*s.* per doz., Baronne Hallez, Destiguy, Egerie, Inermis, Laura Raymond, La Seduisante, L'Enfant du Mont Carmel, Louise Peyronny, Ludovic Letaud, Madame Audry, Madame Ducher, Madame Fremion, Madame Hilaire, Miss Meymott, Souvenir de la Reine des Belges.

BENJAMIN R. CANT, in offering the above, does so with the greatest confidence, as he has received several letters from customers stating that the plants sent are far better than those generally supplied by the Trade.

ST. JOHN'S STREET NURSERY, COLCHESTER.

Carriage paid to London and Norwich and all intermediate stations on the Line. Unknown Correspondents are requested to send a remittance or reference.

WELLINGTONIA GIGANTEA.

MESSRS. VEITCH AND SON are now prepared to supply healthy young established Seedling Plants of the above magnificent Tree. For terms, &c., see the Advertisement of their New Plants in another part of this Paper.

Exeter and Chelsea.—June 17, 1854.

CHINESE PÆONIES.

JOHN SALTER'S fine Collection is now in bloom, and may be seen every day, except Sunday; also his unrivalled collection of IRIS GERMANICA.

Versailles Nursery, near Hammersmith Turnpike, Middlesex.

ORCHARD HOUSE CULTURE.

T. RIVERS will have much pleasure in showing his ORCHARD HOUSES to any one interested in this interesting mode of cultivating Fruits. The Harlow Station is the most convenient for the Nurseries, and a train leaving Bishopsgate at 11.30 the most eligible. Harlow 1½ mile from the Nurseries.

Nurseries, Sawbridgeworth, Herts.

NEW VARIEGATED GERANIUMS, ATTRACTION AND SILVER KING.

JOHN AND CHARLES LEE are now sending out strong plants of these elegant novelties, which they can recommend as surpassing anything of the kind hitherto introduced.

ATTRACTION has a decided crimson horse-shoe, on a finely variegated foliage, which greatly enhances its beauty. The flowers are light scarlet. Price 10*s.* 6*d.* each.

SILVER KING is of a dwarf free habit, the leaves perfectly flat, with a very broad silver margin; flowers intense scarlet. Price 7*s.* 6*d.* each, or 70*s.* per dozen.

Nursery and Seed Establishment, Hammersmith, near London.

SPLENDID NEW HYBRID FUCHSIA. "FUCHSIA DOMINIANA."

MESSRS. VEITCH & SON, of Exeter and Chelsea, can now supply good well-established plants of this really fine Fuchsia. Price 10*s.* 6*d.* each, with one over when three are taken. The merit of raising this beautiful plant is due to Mr. Dominy, the Foreman of the Plant Department at the Exeter Nursery; it consequently bears his name as a memento of his zeal and ability in the performance of his duties. It is a seedling between Serratifolia multiflora and spectabilis, having the fine free growth of the former and the splendid flowers of the latter.

It was exhibited at the National Floricultural Society's Meeting, October 6, 1853, and had a Certificate of Merit awarded it. It was also exhibited at the London Horticultural Society's Meeting, on the 16th of the same month, and was again similarly rewarded.—Exeter and Chelsea Nurseries, June 17.

PATTERSON'S SCARLET NONPAREIL STRAWBERRY.

JAMES VEITCH, JUN., has the pleasure to inform the public that Mr. Patterson, Gardener to Baroness Wenman, of Thame Park, Oxon, has placed in his hands for distribution the stock of the above first-rate Seedling Strawberry, which, having been fully tested and exhibited, has proved to be of very superior excellence.

It was exhibited at Chiswick, on Saturday, June 3, and received the Silver Knightian Medal; it has also been submitted to Dr. Lindley, Mr. Marnock, and Mr. Thompson, all of whom report most favourably of its merits.

It is a *first-class forcing* Strawberry in character, intermediate between *its parents—Keens' Seedling* and *British Queen*; of the vigorous habit of the *former*, and fully one week earlier in ripening; and in the quality of its fruit *fully equal* in flavour, if not superior, to the latter. The fruit is of a large size and handsome shape, of a *bright red colour*, and with a remarkably high perfume.

Orders are now taking for strong plants to be sent out the first week in September on the following terms:—

100 Plants ... £3 | 50 Plants ... £2 | 12 Plants ... 1*s.*

Exotic Nursery, Chelsea.—June 17.

BETHAM & BLACKITH, GENERAL TRANSIT AGENTS,

according to annual custom, as the season is approaching for the importation of Dutch Bulbs and Plants, again have the pleasure of offering their services, and of assuring their friends that all packages consigned to their care will be forwarded to their destination without delay, and at very moderate charges.

Agents:—in Rotterdam, Mr. J. A. HOUWENS; Ostend, Messrs. R. ST. AMOUR et fils; New York, Mr. G. G. SHEPPARD, 187, Water Street.

Cox's Quay, Lower Thames Street, London, June 17.

RICK CLOTHS, MARQUEES, TENTS, ETC.,

NEW OR SECOND-HAND, FOR SALE OR HIRE.

BENJAMIN EDGINGTON has, for the ensuing season, an extensive assortment of Marquees, &c., for Horticultural Societies, Fêtes, Cricket Clubs, &c. Rick Cloths, with poles, pulleys, and lines complete. A variety of Emigration Tents erected on the premises, No. 2, Duke Street, Southwark. Netting and Bunting for Fruit Trees.

Warehouse, 32, Charing Cross, where Tents are erected. Address by post, No. 2, Duke Street, Southwark.

TENTS, MARQUEES, AND RICK CLOTHS.—

Now on Sale, several second-hand Rick Cloths, Marquees, and Tents, of various sizes. Some of the Marquees are well adapted for Horticultural Societies. One 50 feet by 30, price 35*l.*; one 70 feet by 30, 50*l.*; and one 100 feet by 30, 65*l.* These are almost new, and quite ready for use. Small Tents for the Wars or Emigrants, weighing 12 lbs., price 25*s.* each, new and waterproof. Small Tents for Gardens, 30*l.* each.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

GARDEN NETS, FISHING NETS, AND SHEEP

NETS made by Machinery at very low prices. New Nets, 1½*d.* per yard. Old Tanned Net, 6*s.* 3*d.* per 100 yards. Nets to cover Pheasantries and for all purposes required.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

SECURITY TO PREMISES.

WIRE FENCING, 4 feet high, fixed on tops of walls, 1*s.* 6*d.* per yard run, including Iron Standards and all expenses of fixing. This Fence has been approved, in many instances, by the Police. It is almost invisible. Iron Wire Fencing for Hares, Rabbits, Cats, Dogs, Deer, Sheep, and enclosing Fowls and Pheasants, 6½*d.* per square yard, in various widths, from 6 feet to 15 inches.—R. RICHARDSON, 21, Tonbridge Place, corner of Judd Street, New Road, London.

THE GRAPE BLIGHT.

MCADAM'S "COMPOSITION" (now used in the Royal Vineries), for the effectual prevention and cure of the Vine Mildew, may be obtained in 1 lb. packets, 3*s.* 6*d.* each, sufficient for 18 gallons of wash.—DAWE, COTTRELL, & BENHAM, Seedsmen, London Agents, 36, Moorgate Street, and 3, Laurence Pountney Lane, City. It may be ordered through any respectable Nurseryman or Tradesman in town or country.

PAGE AND CO.'S COMPOSITION FOR THE DESTRUCTION OF MILDEW UPON VINES, BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, AND STOVE AND GREENHOUSE PLANTS.—Extra strong, 4*s.* per gallon, sufficient to make four (jars and barrels extra); in bottles, 1*s.* 3*d.* and 2*s.* 6*d.* each. 10 gallons and upwards carriage free to London. Directions for use and copies of testimonials upon application. For testimonials see whole page *Gardeners' Chronicle*, March 11, 1854, describing the SATISFACTORY RESULTS derived from its use in cases of Vine Mildew, Thrip, Scale, Green Fly, Red Spider, Mealy Bug, &c., not only without injuring the most delicate flowers or foliage, but promotes a vigorous growth; it is highly appreciated at the Royal Gardens, Osborne Palace, the Royal Gardens, Claremont, and by the principal nobility and gentry in the United Kingdom.

Finest Grasses for Lawns and Parks, and every variety of Garden and Farm Seeds, at B. PAGE & Co.'s, Seed Merchants, Oxford Street, Southampton.

PROTOXIDE ANTI-CORROSION PAINT, for all external purposes, on iron, wood, brickwork, or stucco, is cheaper, and more durable, than any similar article.—Manufactured by CHARLES FRANCIS & SONS, Cement Works, Nine Elms, London.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

IMPORTANT TO GROWERS OF ROSES.

NEWLY-INVENTED APHIS BRUSH, OR GREEN FLY DESTROYER.—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the Rev. E. S. BULL, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage. Price 2*s.* 6*d.* each.

MANUFACTURED BY

JOSLIN AND SONS,

IRONMONGERS, Colchester.

Retailed by all the principal Ironmongers.

Wholesale agents: W. Thompson and Son, 15, Upper North Place, Gray's Inn Lane Road, London.

Sparrow Proof Netting, Galvanised, 3*d.* per square foot, made to any size for the same proportionate price. This article was shown at the Great Exhibition, where it was so much admired for its light and durable appearance, and acknowledged to be the cheapest and best article of the kind ever offered. Extra strong Wire Sheep Netting, 3 feet high, 1*s.* 6*d.* and 2*s.* 3*d.* per yard. Also every description of Flower Trainers, Dahlia Rods, Garden Arches, Bordering, Flower Stands, Tying Wire, Trellis Work, Invisible Wire Fencing, Hurdles, and every description of Wire Work for Horticultural purposes.—Illustrated Catalogues of Patterns forwarded, post free, on application to T. H. FOX, City of London Wire Work and Iron Fence Manufactory, 44, Skinner Street, and 6 and 8, Snow Hill, London.

NEW AND BEAUTIFUL PLANTS.

MESSRS. VEITCH & SON,

OF EXETER, AND THE EXOTIC NURSERY, CHELSEA,

HAVE much pleasure and confidence in offering the following novelties. Never, perhaps, have they had the opportunity of presenting at one time so many really VALUABLE and STERLING PLANTS as they do on this occasion, believing them all to be Plants that will give general satisfaction, and tend to increase that confidence and support which have so long and so liberally been bestowed upon them.

The Plants are well established; and all Orders will be executed in the rotation in which they are received.

WELLINGTONIA GIGANTEA.

Ample description of this noble tree having lately appeared in the *Gardeners' Chronicle*, the *Times*, the *Illustrated London News*, Curtis's *Botanical Magazine*, the *Florist*, and other publications, it is only necessary now to say that it is a perfectly hardy Coniferous tree, of immense dimensions and great beauty.

Fine established seedling plants are now ready to send out on the following terms:—

One plant, 2 guineas	Eight plants, 10 guineas
Four do., 6 "	Twelve do., 12 "

DESFONTAINIA SPINOSA.

A fine hardy evergreen flowering shrub, with glossy Holly-like foliage, introduced from the Andes of Patagonia by Mr. W. Lobb, *who discovered it in the region of snow.*

It produces beautiful tubular-shaped blossoms, often 2 inches in length, and of a rich scarlet colour tipped with yellow. (See figure in Curtis's Bot. Magazine for May, 1854.)

This plant having been fully exposed in the open ground during the three last winters may, consequently, be declared to *be perfectly hardy.*

It will certainly be a great acquisition.

Fine established plants, in three sizes, 21*s.*, 42*s.*, and 63*s.* each.

One over on three to the trade.

CERATOSTEMA LONGIFLORUM.

(Fig. in Curtis's Bot. Mag. for April, 1854.)

A beautiful dwarf evergreen Greenhouse Shrub, introduced through Mr. W. Lobb, from the Andes of Peru.

It bears bunches of large tubular-shaped flowers, of a rich orange scarlet colour, of a stout waxy texture, and which are of great duration.

It was exhibited at Chiswick in July 1853, and obtained the first prize for new and rare plants.

Good established plants, of two sizes, 21*s.* and 31*s.* 6*d.* each.

One over on three to the trade.

LOMATIA FERRUGINEA.

This fine Evergreen Shrub was found in Chiloe and Patagonia by Mr. W. Lobb.

It attains a height of from 6 to 8 feet, and is remarkable for its beautiful Fern-like foliage.

As a fine leaved Conservatory Plant it is perhaps without a rival, and no collection of fine foliaged plants should be without it.

It has but to be seen to be admired.

Fine established plants of two sizes, 31*s.* 6*d.* and 42*s.* each.

One over on three to the trade.

EUGENIA, OR MYRTUS UGNI.

(Figured in Curtis's "Botanical Magazine" for Jan., 1852.)

This very interesting evergreen flowering shrub was obtained from Patagonia through Mr. W. Lobb.

It has stood several winters in the open ground without shelter, producing its delightfully fragrant flowers in July, succeeded by Strawberry-flavoured berries, eaten in Chili as dessert.

It is a plant of easy culture, and blooming freely in a small state, is well adapted for growing in pots.

Strong blooming plants in 48-sized pots, 21*s.* each.
Second-sized do., in 60-sized pots, 15*s.* each.

One over on three to the trade.

IMPATIENS JERDONIÆ.

This beautiful new Balsam is figured in "The Florist" of January last, and is certainly one of the most interesting of recent introductions.

It is of a dwarf neat habit, of easy cultivation, requiring the temperature of a warm greenhouse or stove, and an abundant bloomer, continuing in flower at least three months.

The flowers are in colour bright red and yellow. It was exhibited in the Hort. Soc. Rooms, 21, Regent Street, on the 18th October last, and had the highest prize for new plants awarded.

This is a lovely little plant.

Fine Established Plants ... ... 10*s.* 6*d.* each.
A few extra-sized do. ... ... 21*s.* "

One over on three to the trade.

HEXACENTRIS LUTEA.

A fine Stove Climber, introduced from the Neilgherry Hills, of easy culture, and great beauty.

It produces its flowers in abundance, on elegant pendulous racemes, of from 15 to 18 inches in length, of a clear bright yellow, unmixed with any other colour.

The effect produced when seen drooping from the roof of the conservatory or a trellis is most striking.

It was exhibited at Chiswick on the 13th May last, and obtained the Silver Banksian Medal.

Strong Established Plants ... ... 21*s.* 0*d.* each.
Second sized " ... ... 10*s.* 6*d.* "

One over on three to the Trade.

VERONICA VARIEGATA.

This lovely hybrid Veronica was raised by J. Anderson, Esq., of Maryfield, Edinburgh, between V. Andersoni and V. salicifolia.

In character it is intermediate between the two parents, having a bushy compact habit, and small glossy foliage.

It is an abundant bloomer.

The racemes of flowers on first appearing are a clear bright pink, and gradually shade off to a pure white, producing a very pretty and striking effect.

It is really a most useful and attractive plant.

It was exhibited at Chiswick in July, 1853, and was awarded a Medal and greatly admired.

Fine bushy plants, 10*s.* 6*d.* each. Three for 21*s.*, to the Trade.

AZALEA INDICA.

Striata formosissima (Taylor).

This beautiful new Azalea is now offered for the first time. It is a seedling raised by Mr. Taylor, gardener to J. Coster, Esq., of Streatham. It is a pure white, flaked and spotted with light purple, fine form, good substance, and first-rate habit.

It was exhibited at the National Floricultural Society, on the 16th June, 1853, and received a Certificate of Merit.

It was also exhibited at the June exhibitions of the Royal Botanical Society, Regent's Park, and the Horticultural Society, at Chiswick, on both which occasions it received prizes.

Worked plants are now ready at 21*s.* each. One over on three to the Trade.

MESSRS. VEITCH & SON can also supply the following good and popular Plants:—

Abies bracteata (seedlings)	63*s.* each.
Aphelandra Leopoldi	21*s.* "
Azalea indica, Beauté de l'Europe ...	3*s.* 6*d.* to 21*s.* each.
Begonia Thwaitsi	10*s.* 6*d.* "
Camellia, Countess of Orkney	21*s.* "
" Storyii	10*s.* 6*d.* "
Hoya fraterna	10*s.* 6*d.* to 21*s.* each.
Ixora Lobbi	10*s.* 6*d.* to 21*s.* "
Lilium giganteum	21*s.*, 42*s.*, 63*s.* "
Philesia buxifolia	21*s.* each.
Rhododendron jasminiflorum	21*s.* to 63*s.* each.
Rhodoleia Championi	7*s.* 6*d.* to 21*s.* "
Streptocarpus biflorus	3*s.* 6*d.* "

Detailed Lists are now preparing, and will be forwarded on application.

NURSERIES, EXETER AND CHELSEA.—June 17. 1854.

CHOICE CINERARIA AND CALCEOLARIA SEEDS.

LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior CINERARIAS AND CALCEOLARIAS, which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias and Calceolarias have given for several successive years enables them to recommend their Seed of the present season with much confidence.

Packets of each, sealed and warranted by them, at 2s. 6d., free by post.—Exeter Nursery, Exeter, June 17.

PLANTS OF CABBAGE, SAVOY, KALE, BROCCOLI, CAULIFLOWER, AND CELERY.

JOHN CATTELL, Westerham, Kent, begs respectfully to inform the public that he has a plentiful supply of Plants of his superior true sorts of the above, which will be forwarded to order on receipt of Postage Stamps or Post Office Order made payable here at the following prices, package included:—All the sorts of Early Cabbage, Savoy, and Kale, including Brussels Sprouts, 6d. per 100; 4s. 6d. per 1000. All the sorts of Autumn and Spring Broccoli, and all the sorts of Celery, 8d. per 100; 5s. 6d. per 1000. Cauliflower, Early and Late, 10d. per 100. Red Cabbage, 1s. per 100; Drumhead, or Cattle Cabbage, 4s. per 1000. Packages of 1000 and upwards delivered free of Carriage to London, and to the Edenbridge Station of the South Eastern Rail.

Seed of Cattell's Dwarf Barnes, and of his superior Dwarf Reliance Cabbage, may be had in packets by post for 12 Penny Stamps per packet; the former containing one ounce as usual, and the latter half an ounce.

GERANIUMS.—Large Surplus Stock of Choice Varieties. Any of the following 9s. per dozen, or the set of 24 for 16s.; strong for immediate flowering.—Alderman, Beauty of Montpelier, Belle of the Village, Centurion, Crusader, Conspicuum, Commissioner, Elegans, Emily, Falstaff, Field Marshal, Generalissimo, Gulielma, Gustavus, Herald, Norah, Magnificent, Nandee, Prince of Orange, Pearl, Rosa, Star, Tyrian Queen, Virgin Queen, Windsor Castle.

FANCY VARIETIES.—Any of the following, 9s. per dozen, or the set of 20 for 14s.—Beauty of Winchester, Delicata, Electra, Exquisite, Fairy Queen, Jehu Improved, Jenny Lind, Le Belle de Africana, Lady F. Hastings, Maid of Anjou, Magnifica, Mazeppa Superb, Marian, Ne Plus Ultra, Odorata Superba, Prince Albert, Reine de Fleurs, Startaski, Village Maid, Zelia.

BASS AND BROWN,
Seed and Horticultural Establishment, Sudbury, Suffolk.

BEDDING PLANTS, &c.—ALL IN POTS, STRONG AND FINE.

The price per 100 for quantities not less than 50.

100 Verbenas, in 30 choice vars., 24s.; 3s. 6d. per doz.
20 „ of 20 best new vars. of 1853, 20s.
100 Petunias, in 25 choice vars., 28s.; 4s. per doz.
10 „ of 10 best new vars. 1853, 10s.
100 Fuchsias, in 50 choice vars., 32s.; 4s. to 6s. per doz.
15 „ of 15 best new vars. of 1853, 25s.
100 Anagallis, best blue and scarlet, 2 vars., 28s.; 4s. per doz.
100 Heliotropes, 28s.; 4s. per dozen.
100 „ in 8 fine vars., 40s.; 6s. per doz.
100 Chrysanthemums, in 100 choice vars., of large flowering and Pompone sorts, 5s. to 7s. 6d. per doz.
10 „ best new large-flowering vars. of 1853, 10s.
21 „ best new Pompone vars. of 1853, 20s.; 12 for 12s.
100 Dahlias, in 50 choice show vars., 35s.; 5s. to 9s. per doz.
100 „ in 30 choice fancy vars., 35s.; 5s. to 9s. per doz.
12 „ best new show vars. of 1853, 21s.
10 „ best new fancy of 1853, 18s.
100 Herbaceous Plants, in 100 fine and showy vars., 30s.
100 „ „ in 100 ditto, including new vars., 50s.
25 Rock Plants, in 25 fine vars., 12s.
24 Dwarf Rock Cistus, in 24 splendid vars., 15s.
50 Phlox, in 50 choice hardy vars., 25s.; 6s. to 9s. per doz.
6 „ of 6 fine new vars. of 1853, 12s.
24 Geraniums, in 24 choice show vars., 16s.; 12 for 9s.
30 „ in 30 choice newer vars., 45s.; 12 for 18s.
12 „ of 12 best new of last season, 44s.
20 „ FANCY, in 20 choice vars., 14s.; 12 for 9s.
12 „ „ in 12 choice newer vars., 18s.
6 „ „ of best new of last season, 18s.

Extensive Collections of Stove and Greenhouse Plants. Complete Catalogues free by post for 6 penny stamps.

☞ GOODS CARRIAGE FREE (not under 20s.) to all the London termini, and all stations on the London and Norwich and Colchester Line. Plants added gratis with orders 40s. and upwards.

BASS & BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

ARTHUR HENDERSON AND CO. take the earliest opportunity of informing their friends and the public, that their CATALOGUES No. 3 and No. 6 are now ready and can be had, post free, upon application.

No. 3 contains descriptive lists of Geraniums, Verbenas, Fuchsias, Calceolarias, Cinerarias, Chrysanthemums, &c., amongst which will be found all the best novelties of the season, also the choicest selections from former years.

No. 6 contains descriptive lists of all the newest and best Stove, Greenhouse, and Hardy plants, amongst which will be found many new and desirable plants.

The following new plants are now on sale:

SEEDLING GLOXINIAS.

ELEANOR.—Ground colour pure white, blotched with rose, and shaded with purple.
ELEGANTISSIMA.—Ground colour French white, of great substance, centre pale lavender, spotted with buff.
EUGENIE.—Ground colour rosy pink, centre creamy white, spotted with rose.
EXQUISITE.—Ground colour pure white, with broad belt of puce, throat creamy white, spotted with puce.
MAGNET.—Ground colour clear rose, with blotch of purple in the throat, flowers large, of fine form.
PRINCE OF WALES.—Ground colour white, shading off to lavender.
SIR C. NAPIER.—Ground colour deep rosy crimson, throat blotched with intense rose, dwarf habit.

The above seven Gloxinias will all be found to be fine varieties, with large well-formed flowers standing well up above the foliage. 7s. 6d. each, or 42s. the set.

CINERARIA EVA.—Ground colour pure white, with narrow margin of purple, dark disc, fine form and substance; received a Certificate at the National Floricultural Society. 10s. 6d.

GERANIUMS.

DIADEMATUM REGINA.—Ground colour deep shining rose, upper petals veined with dark purple and white, with blotch of bright orange crimson; very dwarf habit, and abundant bloomer; a fine variety for bedding. 7s. 6d.
DIADEMATUM SIDONIUM MULTIFLORUM.—Lower petals rosy purple, shaded with crimson; upper petals orange crimson, veined with dark maroon; trusses large, habit dwarf and compact, abundant bloomer; a fine variety for bedding. 10s. 6d.
PRINCESS.—Ground colour blush white, veined and shaded with carmine, dark horse-shoe foliage, large globular-shaped trusses, and most abundant bloomer. 7s. 6d.

CETERACH MARANTA (syn. Nothoclena maranta).—A new hardy Fern from the Alps of Switzerland; fronds bipinnate, about 8 inches in length, densely coated with golden brown scales on the under side. 15s.

Pine-apple Place, London, June 17.

GOOD FREE FLOWERING ORCHIDS.

THOMAS JACKSON AND SON beg to offer the following:—Acineta Barkeri, Acropera Loddigesi, Cypripedium insigne, Dendrobium chrysanthum, D. Jenkinsi, D. moschatum, D. nobile, D. Pierardi, D. pulchellum, Epidendrum aurantiacum, E. ciliare, Lælia autumnalis, Lycaste cruenta, L. Skinneri, Maxillaria Harrisoni, M. picta, Oncidium altissimum, O. Cebolleti, O. flexuosum, O. leucochilum, O. macropterum, Phaius albus, P. grandifolius, Rodriguezia planifolia, Stanhopea insignis major, S. oculata, S. tigrina major.

T. J. & SON, having a fine Stock of healthy plants of good Orchids suited for amateurs commencing a collection, will be glad to furnish 12 distinct kinds from the above, selected by T. J. & Son, for 42s.; 12 selected from the above by the purchaser, 63s. Many of the more rare Orchids at equally low prices.

Kingston, near London.

NEW VERBENAS.

THOMAS BARNES, having a fine stock of the undernamed, is enabled to offer them at the following reduced prices, viz., 1s. 6d. each, 15s. per dozen, or 25s. for two dozen:—

Arthur, Augustine, Ajax, Annie Laurie, Attraction, Ariosta, Arethusa, Beauty, Beauty of the Garden, Brilliant de Vaise, Bouquet Parfait, Canary Bird, Captivation, Diadem, Emily, Eblouisante (best scarlet out), Goliath, Hector (finest purple), Ida, Imperatrice Eugenie, Lutea pallida, Madame de Stael, Madame Schmidt, Madame Binder, Madame Jardine, Madame de Cataliere, Madame Modeste, Mdlle. de Bandinot, Mdlle. de Frilense, Maria Louiza, Marie Antoinette, Madonna B, Madonna H, Matchless, Mrs. F. G. Caley, Mrs. Gerard Leigh, Mrs. D. Tysson, Nima, Ne Plus Ultra, Othello, Orion, Pompey, President, Princesse Rousseau, Purple Perfection, Reine des Amazones, Rouge et Noir, Robin Hood, Sulphur Model, Triomphe de Chartrum, Vicomte de Belival, William Barnes.

*** Good border Dahlias, 25s. per 100.

Dane Croft Nurseries, Stowmarket.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant blogmer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21s.

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gaufred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21s.

The Gardeners' Chronicle.

SATURDAY, JUNE 17, 1854.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, June 20—Linnean ..... 8 P.M.
WEDNESDAY, — 21—Royal Botanic Gardens ..... 2 P.M.

WE trust that some of the officers now with the army of the East will have leisure to examine the trees of the little visited districts of Roumelia and Asia Minor. So severe have been the losses lately experienced in gardens from frost that we look with more interest than ever to those rugged climates, the vegetable inhabitants of which bid defiance to the rigours of winter. How little we know of the trees of those countries is evident from the fact that neither Quercus rigida nor rotundifolia, two evergreen Oaks, have ever been seen alive in England, although they cannot but be common on the southern slopes of the Balkan; and that a recent traveller in Asia Minor has pointed out the existence of an entirely new species of Fir tree, existing in a region heavily timbered with Cedars of Lebanon, of the existence of which we had no previous knowledge.

M. DE TCHIHATCHEFF, in a late communication to the *Revue Horticole*, informs us that while following the southern slope of the Bulgardagh, (a hill-country forming a spur, we believe, of Taurus), he was struck by the magnificent forests of Cedar, which reached the upper regions of this majestic ridge of mountains. At first he was inclined to think that they were local, but on reascending the Zamanta San, as far as the Forach, and on crossing the mountains which separate the Zamanta San from the Saihum, where it escapes, he had for several days the pleasure of beholding the finest Cedar forests which are probably at present known to exist—forests which may occupy a belt of land stretching for some 35 or 40 leagues from the south-west to the north-east. Up to the present time, says M. DE TCHIHATCHEFF, botanists have been in the habit of making a pilgrimage to Lebanon to see the Cedars there, and about 15 years ago he himself visited that celebrated mountain, and contemplated with due reverence the 10 or 12 trunks which stand isolated upon it; but they appeared to be sorry objects after the fine forests now visited, with which the Cedars of Lebanon no more deserve to be compared than our hothouse Palms with the Palms of the tropics. Had Linnæus been acquainted with the Cedars of Caramania, he would never have given the name C. Libani to what our traveller calls the king of Conifers.

Whilst crossing the Cedar country, M. DE TCHIHATCHEFF observed, more or less constantly associated with the Cedars, two other Coniferous trees, of which one is a new species. These two trees are *Abies Cilicia* and *Juniperus drupacea*. What he calls Abies Cilicia has leaves like those of A. pectinata, but is characterised by cones which measure as much as a quarter of a yard in length. The slender, white, upright stalks which remain after the scales of the cones have fallen off, give a most remarkable appearance to this tree.

Since we know nothing here of A. Cilicia, it may be as well to translate the following description of it as given by M. KOTSCHY, a well-known botanist, who passed some time on Taurus:—

"Abies Cilicia is a tree about 15 yards high, pyramidal in shape, and upright; its trunk is a little more than half a yard in diameter, and bears branches from its very base. The bark is ash grey, very thick, deeply cracked, and covered all over with little round smooth pits. The whorls of branches are very close to each other; the lower branches, at first horizontal, rise towards their ends; the upper ones, diminishing gradually in size, rise from the stem in acute angles. The leaves are 0.03m. long, and 0.003m. at the broadest; they are almost always twisted at the base, and their apex is slightly emarginate. The male catkin is pedunculated, cylindrical, rounded at its apex, about 0.03m. in length, and 0.006m. in breadth. The crest of the anthers is in the shape of a tongue with a triangular point and entire edges. The cones are from 0.25m. to 0.30m. long and 0.06m. broad, nearly cylindrical, rounded at the base, obtuse at the top, and generally having a concave depression. Each scale is about 0.04m. broad and 0.03m. long, measuring from the base of the claw; the upper edge is transversely elliptical, truncated, and perfectly entire; the lateral edges are rounded, almost into half a circle, transparent, and eroded with a wedge-shaped base suddenly narrowed into a claw. The bract is small, strap shaped, a little contracted at the top, from which proceeds an almost quadrangular lamina, crenated at the end, and furnished with a central point about 0.003m. in length, and scarcely projecting. The seeds are three-cornered, obovate, with an obliquely wedge-shaped wing."

This Fir belongs to the group in which the bracts are entirely concealed by the scales of the cones. Its silvery colour is described as giving it a pretty appearance. It is remarkable for its upright habit, its trunk branching from the base, and for its shoots being covered with long closely-packed leaves. The numerous cones are said to make the top of the tree look like a candelabrum, with its wax lights.

The tree was discovered, in 1853, by M. KOTSCHY, in one of the valleys of the Taurus, the Gusgula, to the N.W. of the great Cilician defile Gülleh-Boghos, and was afterwards found on the southern slope of the great mountain chain called Bulgardagh in Cilicia, where it grows along with the Cedar, at a height of from 1100 to 2500 yards above the level of the sea. Sometimes it is found in company with the Juniper mentioned below, at other times it itself and alone forms immense forests. It begins to bear cones when about 10 years old. Such a plant as this can hardly be confined to Caramania, but may be expected to occur anywhere on the mountains of Asia Minor, and would be a great acquisition.

So would an abundant supply of the berries of the magnificent *Juniperus drupacea*, everywhere found accompanying the Cedars. These berries are said to be as large as a nut, and covered with a blue bloom like that of a Plum; moreover, they melt in the mouth, and have a very agreeable taste—at least M. KOTSCHY thought so.

In addition to the Cilician Silver and the Drupaceous Juniper, there also occur in similar localities *Juniperus rufescens*, which takes the place of *J. oxycedrus* of southern Europe, and a Pine allied to *Pinus halepensis*.

We shall take some early opportunity of publishing figures of Juniperus drupacea and the two Oaks above mentioned, so that officers in the East may recognise them. But of Abies Cilicia no specimens exist, that we at present know of, in the herbaria of England. Its stiff stumpy habit, silvery colour, and long upright cones, the rachis or receptacle of whose scales remains long after the scales themselves have dropped off, must render it easy to make out.

Let us add that the common deciduous Oaks of the southern face of the Balkan are well worthy of examination. What are they? Of what quality is their timber? Dried specimens of their leaves, and a few boxes of Acorns, the latter packed in dry earth and forwarded by a steamer, would soon enlighten us upon that point.

OUR intelligent correspondent, M. de JONGHE, of Brussels, a letter from whom we published at p. 286 of the present volume, having recently visited England, and seen what our fruit gardens are, has communicated the following striking observations, which for the present we submit to our readers without comment. Possibly some of the cultivators alluded to by M. de JONGHE may have some observations to offer upon his letter.

"Since my letter of May the 1st, I have continued to observe the fruit trees in my own gardens and in those of my friends, and everything tends to show the truth of what I before stated. The hardy

Pears grafted on Pear stocks preserved such of their fruit as was set, in spite of the frosts of the 24th and 25th of April; so also did the hardy Plums grafted on the Damas blanc. So did Cherries worked on the Guigne (a variety between the Merise and Griotte), Peaches on the Myrobalan or Cherry Plum, and Apricots on the common coarse blue Plum. This proves that fruit trees on seedling stocks, which send strong roots into the ground, are more vigorous, have more sap, are better able to resist the drought and cold of spring, than Pears worked on Quinces, Cherries on the Merise, Plums on Mirabelles, Apples on Paradise stocks, or Peaches and Apricots on Almonds. Such stocks may suit countries warmer than Belgium and England, and with a different kind of soil. In the reports made to you nothing is said as to the nature of the soil or the stocks upon which the trees are grafted; nor is the variety of fruit given which has suffered most from the frost. These points are, however, of the utmost importance, and require to be correctly ascertained.

"Your nurserymen import from Angers, Orleans, and Paris, young trees, because of their low price, and they expect them to suit England; but such trees cannot succeed better with you than with us, and one of our principal growers has completely lost his business, by persisting in the practice. In July, 1853, I saw, in Gloucestershire, very fine Pear trees (worked on Pear stocks), but those coarse trees, although of considerable size, bore little fruit, even in the best gardens I visited. In all I was greatly struck with the complete absence of all pruning, thinning, and cleaning from insects.

"The soil and climate of Cheltenham appeared to me well suited for the cultivation of our new varieties of very hardy Pears, if worked on the Pear stock. I suggested this to a well-known amateur at Cheltenham, and proposed that he should commence the experiment in the Pittville Gardens, but no trial has, I believe, been made. By forming an orchard of 100 hardy varieties of Pear grafted on wild Pear stocks, it would be seen, after five years at the longest, which varieties best suited the climate, and such an operation would not cost above 20*l*. The introduction of good fruit for dessert would surely be worth a little trouble, most especially in a town where there does not exist, so far as I could discover, one single plant of Passe Colmar, Glout Morceau, or Marie Louise, even on walls. The Cheltenham Society prefers to spend 100*l*. upon a flower show—the glitter of a day—which leaves nothing behind of permanent value! It will, I am afraid, take a long time to change the taste of the English people in this respect.

"I propose at some future time to send, for the benefit of your readers, a list of those varieties of hardy trees, which yield indisputably excellent fruit, and which I have quite recently found to be safe from the frost in Brussels and its neighbourhood. Gentlemen who were here the other day were surprised to see that all the fruit of our hardy varieties is uninjured, whilst nearly all the varieties brought from Lyons, Orleans, Angers, and Laval, have lost their fruit.

"The Beurré Clairgeau * from Nantes, which was in a very cold place, must be mentioned as an exception, being uninjured, and all its fruit saved, whether on pyramid or standard, and whether worked on the Pear or the Quince. This new variety is, no doubt, the hardiest and most productive of all the Pears which come from France. Its quality is delicious, and the fruit as fine in appearance as the Duchesse d'Angoulême. The tree is, morever, much more hardy than that variety, whether it is worked on the Pear or Quince stock."

VEGETABLE PATHOLOGY.—No. XXIV.

106. THE main object to which the whole system of organs in any individual plant tends, is the reproduction of the species by means of seed. Other modes of propagation are more or less accidental, though they are sometimes so predominant as to render the formation of the true fruit a rare occurrence. In all such cases, however, the same innate tendency exists, and where the accidental modes of propagation are kept in check, is carried out as perfectly as in those plants which possess no other means of propagation.

107. In cryptogamic plants, where the reproductive bodies consist for the most part of a single cell, there is no regular transformation of the component parts of the vegetative system into organs of fructification; or if actual metamorphoses are obscurely indicated, as in the formation of the calyptra in mosses from a convoluted leaf, it is amongst the higher cryptogams, which more closely simulate the superior products of vegetation, that they occur. In a large proportion the cellular tissue in privileged portions of its course either becomes organised into some form of fruit, the spores themselves being either generated at the expense of the contents of certain cells, or produced externally in the form of either terminal or lateral prolongations or ramifications of the tissue itself, however complicated the receptacle may be.

108. In the higher cryptogams there are, beyond doubt, distinct sexes, the concurrence of either form of fruit being for the most part necessary for the production of new seedlings, though, as in phænogams, there are frequently superadded other modes of propagation analogous to the reproduction by means of tubers, runners, suckers, bulbs, &c. There is also great reason to believe that the principle extends to the lower cryptogams. It is proved beyond the possibility of cavilling in Algæ, and there are, at least, analogues in fungi and lichens, if there are not true spermatozoids. It is obvious, however, that this is not the place to enter at great length into the curious questions connected with the impregnation and germination of cryptogams.

109. In phænogams the reproductive apparatus, taken as a whole, consists of an indefinite number of successive whorls of leaves, in a greater or less state of alteration. However different the functions of these may be, or however strange their modifications, all are clearly so many metamorphosed leaves, whether sepals, petals, stamens, or pistils, in some few cases, perhaps, the terminal point of the axis giving rise to the spongy body on which the ovules are seated. Though, however, we are by no means inclined to disbelieve the existence of a central placenta, it is quite certain that many apparent exceptions are really referable to the more ordinary forms, a striking proof of which is afforded by the Carnation, the curious transformation of whose ovules into one or more carpels, with a true marginal placentation, is figured in the *Gardeners' Chronicle*, 1850, p. 612.

110. As the sepals, petals, &c., are transformed leaves, they are capable, in certain instances, of developing a bud in their axil, though this is very rarely present. Several curious cases are recorded and figured in the "Theory of Horticulture." Such anomalies, however, will find a place in a later division of the work, as they are, according to our definition, properly to be considered as so many cases of disease.

111. The flowers of phænogams may be without either sepals or petals, but they cannot be without stamens or pistils, whether united in the same flower or separated, either upon the same or different plants. The stamens and male organs vary greatly in structure; but some particular part of their tissue, varying according to circumstances, in every case gives rise to distinct organisms, known by the name of pollen grains, which for the most part separate readily from the parent organ in the form of a coloured dust consisting of single cells or several combined together; while, in other cases, the grains are collected into a waxy mass which is never entirely disintegrated.

112. The pistil or young ovary consists of one or more leaves variously combined, a portion of the tissue at the edges of which, either through the whole or a portion only of their length, assumes a spongy form, and gives rise to little sacs, or protuberances known by the name of ovules, consisting of several distinct coats, which ultimately become seeds. These ovules are analogous to the buds or bulbs occasionally formed from the parenchym of leaves, and if we may judge from such cases as that of the Carnation mentioned above, or from the leaflet so commonly produced at the edge of the carpels in a peculiar state of Trifolium repens, consist of one or more leaves, reduced to a rudimentary state, in the centre of which is contained a sac filled with organisable matter in which the embryo is ultimately formed.

113. Besides the placenta, another portion of the tissue of the leaves which constitutes the pistil is exposed, being destitute of cuticle; and this, under a variety of forms, furnishes the stigmatic tissue by the mediation of which the impregnation of the ovules takes place, and true seed is ultimately formed. *M. J. B.*

THE GENUS CYTISUS.

THE species and varieties belonging to this genus are among the gayest and most easily cultivated of our winter and early spring flowering plants, producing, with ordinary management, an abundance of bright-coloured cheerful-looking flowers for some three months in succession; and for amateurs, having only a small collection of plants, nothing could be more useful.

Beginners should commence with young plants, of C. racemosus for instance, which, if procured at once, will form nice little specimens for blooming in spring; they should be placed in a cold frame, or a cool airy part of the greenhouse, giving them plenty of water at the root, syringing them overhead on the mornings and evenings of bright days, and keeping them near the glass, to induce close short-jointed growth. If the pots are found to be well filled with roots, which, in the case of healthy plants received from the nursery, will be sure to be the case, give a liberal shift, say into pots two sizes larger than those in which they have been growing. For soil use about equal parts of good rich light turfy loam, and strong fibry peat, broken up so that it would pass through a half-inch mesh sieve, and well intermixed with sharp sand, and some lumpy bits of charcoal, to keep the mass open after the decay of the fibre. Care should be observed to thoroughly drain the pots, for the plants will be found to require a very liberal supply of water; and unless perfect drainage is secured, the soil will be apt to become sour towards the bottom of the pots. Beyond the ordinary routine of watering, syringing, &c., very little attention will be necessary during the growing season; but if spider should make its appearance, no time must be lost in eradicating it, by laying the plants on a clean mat and thoroughly washing the under sides of the leaves with the syringe; this operation, repeated twice a week for a fortnight, will generally be successful, unless when the plants are growing in too warm a situation, and in this case it will be nearly impossible to keep them free from this pest. If any branch is observed to be taking a decided lead of its fellows, it should be stopped, and the main shoot should be kept neatly tied to a stake; this is supposing that the object is to obtain a well furnished pyramidal bush, which is decidedly the best method of training; but if any other form is desired, it will be easily obtained by timely attention; for the plants, being vigorous growers, are easily trained, with a little care, in any shape. If the plants can be kept near the glass in a light airy situation, so as to induce short compact growth, they may be kept growing till late in autumn, but they should not be kept too close at this season. They may be wintered in a cold pit or wherever they can be protected from damp, for a few degrees of frost will not injure them. After they have bloomed in spring allow them to stand in a rather cool place for a fortnight, then cut in the shoots slightly, and place them in a moist and rather close spot, to induce the buds to break freely, and when the young shoots are about an inch long, re-pot, giving a liberal shift, using the same soil, &c., as already recommended, and retain them in a growing temperature, syringing freely until the roots get hold of the fresh soil. When this is the case they may be more freely exposed to air, and as soon as the weather permits, removed to a sheltered situation out of doors, where they will not be exposed to the mid-day sun. Here they will grow freely and will not be so liable to be infested with red spider as in the greenhouse.

With a little attention it is easy to have these plants in bloom at almost any time during the winter, but to effect this they ought to be started into growth sufficiently early to allow of having the young wood firm by the middle of September, after which time the plants should be freely exposed to the sun, and not overwatered at the root. Treated in this way they will commence flowering immediately they are placed in a moderately warm greenhouse, and if supplied with manure water they will bloom profusely for a long time in succession. When the specimens become too large to be conveniently re-potted every season, supply them liberally with manure water while making their wood and blooming, which will preserve them in sufficient vigour for several seasons; or they may be slightly disrooted every year, repotting them in the same sized pots, and using very rich soil. *Alpha.*

DESCRIPTIONS OF NEW PEARS CULTIVATED BY M. DE LIRON D'AIROLES, AT LA CIVELIERE, NANTES.—BY HIMSELF.

Beurré Clairgeau.—Tree remarkably vigorous, and soon forms a handsome pyramid; succeeds well against a wall with a south or an east aspect; bears abundantly, and at an early age. Fruit variable in form, but generally calebasse-shaped; a superb fruit, weighing sometimes 20 ounces. It gained the first prize of the Horticultural Society of the Seine, in 1851. Its skin is fine, almost entirely covered with patches of reddish russet when gathered; but at its full maturity, which occurs in November and December, it becomes richly coloured with yellow and vermilion. Its flesh is fine, white, melting, very juicy, sugary, and perfumed. Raised by Pierre Clairgeau, a gardener at Nantes.

Beurré de Nantes, or Nantais.—Tree vigorous, adapted for a pyramid or for training against a wall; it soon comes into a bearing state. Fruit large, oblong, of the form of the St. Germain; skin light green, yellowish when fully ripe; flesh white, melting, very juicy, and perfumed; ripens in September. One of the most handsome and delicious of the new Pears. It was raised by François Maisonneuve, a horticulturist at Nantes.

Beurré Delfosse.—Tree vigorous, suitable for a pyramid or standard. Fruit middle-sized, roundish; skin yellowish brown, slightly tinged with red next the sun. Flesh white, fine, buttery, and melting; very juicy, and sugary, with a delicious, perfumed flavour, somewhat resembling that of the Passe Colmar. Becomes fit for use in Belgium in December and January. Raised by M. Grégoire, of Jodoigne, Belgium.

Bergamotte Hambourg.—Tree vigorous, forms a handsome pyramid, and is also adapted for a standard; an abundant bearer. Fruit large, Bergamot-shaped, from 3 to 3½ inches in diameter; skin rough, green, changing to citron yellow when ripe, dotted with brown, and tinged with red next the sun. Flesh white, very fine, somewhat buttery, juice abundant, sugary, perfumed like the Rousselets and Bergamots. An excellent fruit, ripening, in Belgium, in the first fortnight of October. Raised by M. Bivert.

Duc d'Orléans.—The original tree has a magnificent pyramidal form. The fruit is middle-sized, or tolerably large, obtuse-pyramidal, of a fine golden yellow, profusely sprinkled with reddish brown, and dark specks; the stalk is slender, woody, and about an inch and a quarter in length. Flesh white, fine, melting, very juicy and sugary, with a vinous perfumed flavour. Season, November and December. Raised by M. Alexander Bivert, and bore, for the first time, in 1847.

Beurré Six.—Tree vigorous and fertile, but requires to be worked on the Pear stock and grown against a wall. It is not adapted for pyramidal training. Fruit large, pyriform; skin smooth, light green dotted with deep green and brown. Flesh white, very fine, melting,

* See third column of this page.

buttery and sugary, with a delicious perfume flavour. Its season of maturity is November and December, in Belgium. Raised by M. Six, nurseryman at Courtray.‖

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

The eleventh anniversary of this charity was held at the London Tavern on Monday last, the 12th inst., T. Grissell, Esq., in the chair, supported by Lieut.-General Sir J. Wilson, J. H. Schröder, Esq., H. G. Bohn, Esq., J. J. Mechi, Esq., Mr. R. Wrench, and about 120 gentlemen.

The usual toasts were proposed and responded to. General Sir J. Wilson returned thanks for the army; and Mr. Tombleson, one of the few survivors of the battle of Trafalgar, returned thanks for the navy. The Chairman proposed the better health of the Duke of Devonshire. He then proposed "Continued Success to the Gardeners' Royal Benevolent Institution." He made a warm appeal to the company in its behalf, and hoped that they would show by their subscriptions the interest they took in the charity. Mr. Wrench proposed the health of the chairman; and after some other healths were drank, the Secretary announced, among many others, the following subscriptions, which had been handed in on the occasion:—

The Duke of Devonshire	£21	0	0
The Baron Rothschild	21	0	0
Messrs. Godfrey and Waterer	21	0	0
G. S. Ridgway, Esq. ...	10	10	0
Thos. Grissell, Esq. ...	10	10	0
Mrs. Schröder	10	10	0
Thomas Baring, Esq. .	10	10	0
Royal Botanic Society	10	10	0
H. R. Cheney, Esq. ...	10	10	0
Messrs. Hurst and M'Mullen	10	10	0
Henry G. Bohn, Esq.	10	10	0
Messrs. Gray and Ormson	10	10	0
W. S. Johnson, Esq. .	£10	10	0
Robert Field, Esq. ...	10	10	0
George Reid, Esq. ...	10	10	0
James Veitch, Esq. ...	10	10	0
Charles Turner, Esq. .	10	10	0
Edward Denyer, Esq....	10	10	0
Charles Palmer, Esq.	5	5	0
R. Wood, Esq.	5	5	0
James Thomson... ...	5	5	0
Messrs. Minier and Co.	5	5	0
J. J. Mechi, Esq. ...	5	5	0
W. B. Booth, Esq. ...	5	5	0
Samuel M. Peto, Esq. .	5	5	0
Earl of March	5	5	0
Sir John Wilson ...	5	0	0

The Chairman then proposed the Horticultural and Royal Botanic Societies, and alluded to the services they had rendered to this charity and the public in general.

Mr. Bohn returned thanks; after several other toasts the meeting separated.

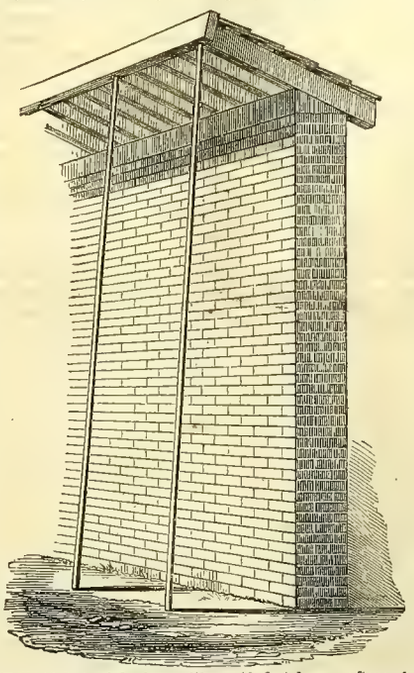
Home Correspondence.

Viviparous Plants.—A remarkable instance of this has just come under my notice: some plants of Pernettya mucronata were placed in a warm moist atmosphere, in which situation they ripened their berries. On opening some of them, every seed was found to have vegetated, in fact the interior of each berry was a mass of young plants. These were carefully taken out and "pricked" into pans, in the same way as ordinary seedlings are treated, and they are progressing favourably. Externally the berries presented no difference from others grown in the open air, except, perhaps, being a trifle larger, and of a paler colour. *Crayon.*

The Winter in Devon.—If I were to name all the plants that have in South Devon braved the late rigorous season, I should give too long a list. I will therefore only say that Araucaria Cunninghami, and Dicksonia antarctica, are both dead, though the former was protected. Our Magnolias have suffered more than usual, though they have sustained no permanent injury. Witheringia superba is killed to the ground, but shooting again, and Viburnum suspensum is slightly injured. Cephalotaxus Fortuni, Rhamnus croceus, Libocedrus chilensis, Cupressus funebris, and many of the new Pines, may be viewed as perfectly hardy in this district, as is Cytisus nubigenus, though growing in a low situation. Against an east wall, and unprotected, Habrothamnus fascicularis has bloomed magnificently, and Cantua bicolor and dependens are in flower now. C. pyrifolia is more tender, and has been killed to the ground. Many plants of Veronica speciosa have done well, and the Chinese Palm is quite hardy. I may add that I have now blooming in pots, under glass, some very fine varieties of Amaryllis, which were raised by a nurseryman in this neighbourhood, Mr. John Mitchell, from seed in a cold frame, and transferred to the open ground, where the bulbs arrived at a flowering state when purchased by me. My Ixias and Sparaxis, &c., are all safe, and Iris Susiana has flowered beautifully. The New Zealand shrub or tree, raised from seed, under the name of "the Lace Bark tree," has stood the winter against a wall. I enclose some twigs of it, and shall be obliged by its name, if known [Philippodendron regium]. It is very graceful, growing as a standard in a pot. We shall have an abundant crop of every kind of fruit, if no more severe weather is experienced; but at Totnes, only 12 miles off, I understand there was ice as thick as a penny piece yesterday (May 23). *A Devonian.*

The Woodcock.—I am of opinion that this bird breeds in many parts of England more frequently than is usually suspected. There is a locality through which I very frequently pass, in which, during the spring and summer months, woodcocks are abundant. The locality alluded to, as may be imagined, is very secluded; in fact, a great portion of it is in reality a game preserve. Heath and Fir plantations predominate, and lakes and streams are abundant. Here, on any fine evening, about sunset, from April to the end of summer, many brace (they always fly in pairs) will cross one's path in the course of a mile. They generally fly low—so low, indeed, that the markings of the feathers may be readily distinguished. And at such times they frequently utter a peculiar note, which I refrain from attempting to convey on paper, but which, as far as my observation goes, is confined to the breeding season. *Crayon.*

Protection of Wall Trees.—I presume to address you on a subject which I conceive must interest the horticultural world. In the year 1792 I accepted this living and retired into this distant part of the kingdom. Having an affluent private fortune, I employed my leisure hours in planting, gardening, and forcing fruits, Pines, Peaches, Nectarines, Vines. I have had fine Grapes every month in the year, having 400 bunches of fine Grapes in a small stove in the difficult month of February, 1805. But the Apricot, which is a bad tree to force, seemed to defy all my endeavours to obtain a crop, always being cut off by the spring frosts. About three years ago I suggested to my gardener, Mr. Evans, who has lived with me above 30 years, the possibility of covering them from the frost in an easy manner, and no sooner suggested than Mr. Evans carried it into execution; and the two last years we had abundant crops, which is the more singular, as this year has been so unfavourable and frosty. The canopy or covering is removable, and composed of rafters and pantiles, which project 2 feet from the wall; and the wall being 12 feet, the iron rod which supports the canopy is 13, making an elevation of 1 foot in the canopy. Five or six pantiles make the canopy, according to the thickness of the wall, and half a pantile must lap over to the north side of the wall to throw the water off the trees situated on the north side, and also to keep the wall dry. If I were to make a new one I would protect all the inner walls in like manner, as no doubt Peaches and Nectarines would bud securely. I have no wish to publish my own fame, living in the most retired manner in my 89th year, being born in Spring Gardens, Westminster, in 1765; but I am unwilling that this discovery should be buried in oblivion, and shall be very happy to show the crop and premises to any one that will honour me with a call. We had above 1800 Apricots upon our trees this year, and a great crop last year. The expense is about 5*s.* per yard, or 5*l.* for 60 feet. We had 1800 Apricots upon our trees before we observed them. The canopy or covering is kept up all the year, which is of great advantage to the walls, and not at all unsightly. *W. B. M. Lisle, L.L.D., Rector of St. Fagan, Cardiff.*



Wall, 12 feet high; iron pillars, 13 feet long; rafters, 4 feet long; over trees, 2 feet; 5 pantiles cover the whole width. Expense per yard, 5*s.*

Storing Potatoes.—The following results obtained by my plan of storing may prove useful. 1. Twelve sacksful of Potatoes, lifted October 25th, 1853, stored with lime, the lime being placed in small bundles in the middle of each sack. Tubers all preserved; whereas some of the same Potatoes, stored without lime, were much affected. 2. Fifty bushels of Potatoes, dug up towards the end of October, were pitted with three bushels of quicklime, the latter being placed at the bottom of the pit, and covered over with a thick layer of Gorse. On opening the pit it was found that the diseased tubers did not amount to more than two dozen. Tubers stored in the ordinary way, in pits without lime, were almost entirely destroyed by disease. 3, 4, 5. Potatoes stored with and without lime quite untouched by the disease. 6. Roots stored in a large chest or box with lime, and the latter being placed in a small clothes-basket, and covered over with faggots. On opening the box the tubers were found quite healthy, whilst some that had been kept in a cellar without lime, were much diseased. 7. Twenty bushels of the tubers were placed in a large bin with three bushels of lime, the latter forming a stratum at the bottom, and covered over with a thick layer of coarse cinders. At the end of three months the roots were found to be quite sound, whilst another lot which had been put into another bin without lime were very much diseased. 8. Potatoes housed in sacks, one or two large lumps of lime being put into each sack, tubers quite dry, and all preserved. 9. Potatoes first dried by exposure on a gravel walk to the heat of the sun, and then stored away in large boxes with lime, all healthy. Tubers housed in their natural condition became diseased. 10. Potatoes housed with lime, all healthy. 11. Same result. 12. Several bushels of Potatoes were pitted with lime, and when examined, at the expiration of several months, were found to remain untouched by the disease. Roots pitted without lime became quite rotten. 13. Two or three hundred bushels of Potatoes were divided into four equal lots. Three of these were pitted with lime, the other in the ordinary way. In the first of the three lots stored with lime, the lime was placed at the bottom of the pit, with the proper precautions; in the second it was thrown into a conical heap in the centre of the tubers; and in the third and last, it was placed on top of the Potatoes, being separated from the latter by a layer of brushwood, &c. On examining the tubers at the end of some months those in the first pit were found to be much diseased, whilst those contained in the other three were nearly healthy. "The best result," says this correspondent, "I am disposed to think was obtained by placing the lime on the top of the tubers, and this is the plan I intend to follow." *Thornton J. Herapath, Mansion House, Old Park, Bristol.*

Poisonous Nature of the Common Yew.—A few days ago a ploughman with his horses took shelter from a storm beneath a Yew tree. The animals fed upon the branches without being checked by the man, who does not appear to have apprehended any danger. A short time afterwards, however, all the horses were seized with illness, which resulted in the death of two of them. As the poisonous nature of the Yew has sometimes been doubted, it may be well to record this fact. But on the other hand, that the Yew can be eaten with impunity by some animals, and under certain conditions (which I do not attempt to define), I have ample proof. Near a farm-yard, with which, some years ago, I was very familiar, stands an old Yew tree, about which, both at morning and evening milking time, the whole dairy of cows constantly assembled. I repeatedly saw them cropping the lower branches, yet I never heard of any injury being sustained by the cows in consequence. Some years ago this subject was discussed somewhat in detail, I think, in your columns, but I do not recollect that any definite conclusions were arrived at. *Crayon.*

Aeration.—Amongst your unanswerable remarks on Wardian cases and plant cultivation, at page 317, is one I wish to notice. It is this: You say, "At present we want the art of maintaining the air of plant-houses in a state of perpetual ingress, egress, and interior motion." Why, that is just the object aimed at, and accomplished too, by the scheme for aerating plant-houses which appeared in your paper at page 38 of the present year, with a subsequent theoretical explanation. Further experience only convinces me of its correctness; and the health of my plants shows the same. Since the ventilator was put in there has been only one fumigation—no sulphuring—no mildew; of how many closed plant-houses can the same be said during the past five months? Foliage so healthy and green, and firm short jointed wood, have called forth frequent remark from visitors, and are the result of perpetual change of air night and day. Whether right or not, I attribute very much of the success which has attended this attempt to the admission of the refreshing night dew; the plants then, unstimulated by the sun's light and heat, suck in copious draughts of moisture, all denied to other more closely attended relatives, duly shut close up every evening, carefully opened, it may be, some time the next day, perhaps the next after that; during all which time my plants have been helping themselves to just exactly their own requirements. It may be asked how is this accomplished? Need I go over the ground again? The matter is so very simple that one is almost sure to miss or overlook it, and yet it is a difficult task to explain it simply. Once grant that a column of warm air is lighter than one of cold air of equal height, and the whole thing rests on how to make a use of that property. I have done so by a box, bottomless and topless, divided down the middle by a partition, thus making two shafts, flues, or air channels, one of which is made shorter than the other by cutting off a part up to the partition; this short side is the exit side, this box is put in the opening made by sliding down the sash from the back wall, the shortest side of the box is put towards the wall, the longest side hanging down in the house, the air in which is presumed to be warmer than the external air, this warm air occupies the highest level, and therefore fills first the shorter side of my box, then commences the aerial motion, like scales of a beam; the heavier side, the cold, comes down; the lighter, the warm, goes up; the descending cool air continues falling, the ascending warm continuing rising, as long as any difference of temperature exists. By filling the house with smoke from damp straw, the eye can confirm the deductions of theory; the exit side only gives forth the vapour, however dense the smoke within may be. An open door of course upsets the scale and converts for the time both channels into outlets. I will say nothing now about the necessary sizes of these air channels—only let them be big enough—they are sure to be too small. I would suggest that for a span-roofed house the ridge be occupied by a ventilator the whole length of the house, of width proportionate to its cubic contents, and arranged as an inlet between two outlets; that is, that my box be doubled, the two inlet sides being put back to back as one may say, and the two outlets on what would then be the two outsides; at the same

time extending it the whole length of the house. This matter is intimately connected with the almost forgotten Polmaise plan of warming, which same plan is still absolutely correct in theory, waiting only some correct applier. Some day it will raise its head again, and by its aid early crops of vegetables will be produced to an extent unthought of now. For truly a hot water apparatus is a costly affair, and only for the wealthy. A house Po'maised and efficiently ventilated may be much nearer accomplishment than many gardeners perhaps imagine. I have found 1 foot difference in length between the sides of my box to give ventilating power enough; but if the principle of making the cool side the longest side be kept in view, the modes of application may be very various, and the material employed in construction—wood, metal, or glass, plain or ornamental. Before incurring a large outlay, an amateur might do as I have done, just apply one of these ventilating boxes to one light of his house, and he will then certainly go further in that direction; for the principle is of universal application. Wherever the air to be withdrawn is warmer (lighter) than the external air, and a communication can be made therewith, then can an interchange of air be effected and the space ventilated. *J. P. S., Chesterford.*

Spring Frosts v. *Early Potatoes.*—I had hoped to have seen in your columns some remarks upon this subject. To induce others to give information I send you the results of my own observations on two points—what mode of cultivation enables the plants to escape injury, and what varieties, by their own nature, are most capable of resisting the power of frost. The best mode of management appears to be the following. Just before the plants come up, scratch the ground well with a common garden rake, and do nothing more to it until the frosts have ceased, which will be about the end of May. This scratching process was adopted merely to destroy the coming Charlock, &c.; but if done in fair weather the surface soon becomes very dry, and the frosts, both black and hoar, affect the land very little. The crops which suffered most severely were those which, after they had come up, were hoed just before the frosts came on. The hoeing had elevated the damp subsoil to the surface, which became much frozen, and the young plants in contact with it were cut down. The conclusion, then, to be drawn is by previous cultivation to get the land as free from weeds as possible; to rake the surface just before the plants appear above ground, and after their appearance not to hoe before the end of May. As to the different kinds, a long early Kidney, called "White Blossom" in this part, suffered most, and the Walnut-leaved and Forty-fold were least injured. In one plot by accident a few Walnut-leaved were planted amongst the White Blossoms, and in another the reverse. In both cases the White Blossoms are nearly destroyed, and the Walnut-leaved promise to be a good crop. We know that different kinds of Beans, Broccoli, Lettuce, &c., vary as to their power of resisting the power of frost, and no doubt to some degree there is a similar difference in the nature of the various kinds of Potato; and as early growth is desirable, because it enables the plant to stand against the "disease," it becomes a matter of importance to know what varieties will resist cold, or recover rapidly after the tops have been frozen. Perhaps Mr. Cuthill will tell us what has been the fate of his Ash-leaved and Lapstone Kidneys; and other observers will also give us the result of their examinations. *L. S.*

Effects of the Late Winter.—At Rolleston Hall, Aucuba japonica has been partially injured; Viburnum Tinus has had its top killed, but is springing from the root; Arbutus Unedo is dead; Pinus apulcensis, Montezumæ, and patula, are killed; of P. insignis some are much injured; P. Pinsapo is slightly hurt; Cupressus macrocarpa, Uhdeana, and thurifera, are killed; of C. torulosa some are partially injured, others are dead. Saxe-Gothæa and Fitz-Roya are unhurt; Taxodium sempervirens is slightly injured; as is also Libocedrus chilensis; of Thuja aurea some are killed; Cedars of Lebanon are uninjured; Deodars have lost their leaves, and some are even killed; Cryptomeria japonica is unhurt; Laurus nobilis has been nearly killed, but it is alive at the roots; Hedera helix is not injured in the least; but Irish Ivy in places is much hurt; Ligustrum vulgare has lost its leaves, but otherwise it is uninjured; the Chinese Privet is killed; Buxus balearica is very much injured, and some are killed; Phillyrea angustifolia has been killed; P. media, partially hurt, while P. obliqua is uninjured; Alaternus is partially affected; Garrya elliptica is slightly injured; G. laurifolia is killed; Quercus gramuntia is killed; Q. Ilex has had its foliage destroyed and injured. Yews in some places are slightly affected; Irish Yews are unhurt; common Laurels are much injured; Portugal partially so; Buddleya globosa is killed; common Furze is unhurt; while the double blossomed has been killed; Yucca gloriosa and filamentosa are injured; common Holly is uninjured; while many of the variegated sorts are killed. Araucaria is much injured, and many of the leaves are dead. Fifteen miles to the north of Rolleston, at Osmaston and Snelstone, in the neighbourhood of Ashbourne, the leaves of the Deodar and Araucaria were not injured in the slightest degree. Many of the above plants appear to have suffered more from the continued drought of the spring than from the severity of the frost. *Rolleston Hall, May 7.*

——At this place (within three miles of Worcester), the green Cistus has been much injured. A Macartney Rose, which grew on a south wall, has been killed to within an inch of the ground. A strong Escallonia macrantha has shared the same fate; a Cantua dependens, though in a warm nook and doubly covered, is quite killed. But some fine seedling Cinerarias, which were cut down and covered with tan, are alive and shooting nicely; likewise a scarlet Geranium, which was treated in the same way under a west wall. The soil is dry and gravelly. *H. M.*

Societies.

LINNEAN, *June 6.*—Professor Bell, President, in the chair. The President nominated F. Boott, Esq., Robert Brown, Esq., W. Spence, Esq., and W. Yarrell, Esq., Vice-Presidents for the ensuing year. W. Ferguson, Esq., and T. B. Phillips, Esq., were elected Fellows of the Society. Among the donations announced were dried specimens of nearly 300 species of plants from the Cape of Good Hope, collected and presented by Dr. Alexander. Mr. Salmon exhibited two specimens of Kestrels, in the preservation of which the substance colouring the legs had been introduced internally beneath the scales of the tarsi. The following papers were read: —1. "On the Osteological Relations observable among a few species of the Bovine Family," by Walter Adam, M.D.—2. "On the External Membrane of the unimpregnated and impregnated Ova of the common Salmon," by John Hogg, Esq., M.A. This paper was accompanied by specimens, preserved in spirits, of the ova, both unimpregnated and also artificially impregnated.—3. A letter from C. J. F. Banbury, Esq., addressed to the secretary, mentioning the appearance of a species of Hoopoe in the British Channel, on the 15th of April in the present year.—4. Extract from a letter from Dr. F. Welwitsch to R. Kippist, Esq., dated St. Paul de Loanda, Tropical West Africa, S. Lat. 8° 48′ 5″, March 2, 1854. Dr. Welwitsch writes—"What astonished me more than anything else at Sierra Leone, was the circumstance that the English, who have now been so long in full possession of this charming territory, nevertheless still remain in utter ignorance of the adjoining negro district, more particularly with respect to the interior of that part of tropical Africa. In Sierra Leone I saw the first parasitical Orchideæ, and almost always in company with a gigantic species of Platycerium (P. Stemmaria, Desv.) In Prince's Island I wandered, while climbing the highest peak, Pico de Papagaio, for a whole hour among flowering examples of Caladium bicolor and many other splendid tropical species. Of Filices alone, I collected about Free Town and on Prince's Island, above 20 species, among them a Gleichenia (? G. Hermanni, R. Br.) with a scandent stipes often 25 feet high! I arrived in Loanda, the capital of Angola, in Oct. 1853, and since then my whole time has been employed in excursions, so that I have already become acquainted with and plundered upwards of 40 miles of coast from the Quisembo River (three miles north of Ambriz), to near the mouth of the mighty Cuanza (about 9° 30′ S. lat.), and possess the materials for a flora of Loanda of five or six miles [? German] in circumference. . . . March and April are, in Angola, the rainy months; and the period of the highest and most luxuriant development of vegetation falls in the months of May and June. . . . What especially surprises me here with respect to the geographical distribution of certain genera, is the occurrence of three or four Aloes, of a Stapelia, and several other Cape genera. Of Euphorbia I have already found near Loanda a gigantic species with a stem 2½ feet in diameter and upwards of 30 feet high, forming woods as the Pinus sylvestris does, and readily discernible from ship-board. In the lakes of the interior, distant about one to three German [4 to 12 English] miles from the coast, I have found almost everywhere magnificent Nymphæas, and Pistia, but in addition our Typha angustifolia and Scirpus maritimus. Of trees, there occur only in the dry coast from only Adansonia, Sterculia, n. sp., and Afzelia, Eriodendron anfractuosum, and a Bauhinia, with three sp. of Palms. On the rivers, however, the tree vegetation becomes dense and more abundant in species. . . . In the woods of Euphorbia (Candelabra n. sp.) is found a wonderfully beautiful terrestrial Orchidea, with a scape 4 to 5 feet high, which ends in a spike a foot long, of large yellow flowers. A truly magnificent Crinum (Broussoneti ?) luxuriates in boggy places; and on hilly slopes the Adansonia digitata is nearly covered by a glaucous-leaved Loranthus, with deep red flowers. It is much to be regretted that excursions in this country are attended with so much expense, and such great inconveniences of all kinds. . . . As there are few roads, and fewer beasts of burden, all baggage, provisions, water, presses, paper, beds, cooking utensils, with the necessary articles for barter, must be conveyed on the heads of negroes, so that even the shortest excursion of three or four days costs an enormous sum." Dr. Welwitsch further announced his intention to dispatch forthwith to England some portion of his collection of plants, both living and dried, of insects, of seeds, &c.; and these it was stated had subsequently arrived.—5. "Description of an apparently new species of Crab, belonging to the family Lithodidæ, found by Mr. W. Lobb, on the sea-shore near St. Francisco, in California," by Adam White, Esq.

BOTANICAL OF EDINBURGH, *June* 13.—The President in the chair. Professor Balfour exhibited the male cone of a Cycadaceous plant, sent by Dr. Stanger from Natal, and named conditionally by Mr. Smith, of Kew, Stangeria paradoxa. The cone had been sent under the name of Lomaria eriopus, picked by Gueinzius at Port Natal, and details in regard to it and the plant have been recently given by Mr. Smith in Hooker's "Kew Miscellany." The leaves have a Fern-like appearance, and are very like those of a Lomaria or Danæa. The venation is inflexed and involute, and the forked veins come from a true mid-rib. Mr. Smith remarks that the latter circumstance shows the untenable nature of the characters distinguishing fossil Ferns and Cycads.—Professor Fleming noticed the occurrence of a remarkable white fungoid production on the roof of a dark cavern excavated for fire-clay in the sandstone quarry at Joppa, near Edinburgh. It seemed to be the mycelium of a fungus originating in the wood which propped up the roof of the mine. The white mass was 7 feet in diameter. Some of the threads were pendant from the roof, and others had dropped on the floor of the mine. Dr. Macbean had examined the substance with a microscope, and found it to be composed of numerous cells arranged in a bead-like manner, but he was not able to detect fructification or spores.—Mr. G. Lawson exhibited under the microscope preparations of the colouring matters of the flower of Strelitzia Reginæ, and drawings of the same. This plant is interesting, as presenting examples of both the xanthic and cyanic series in the same flower, but still more remarkable in the microscopical peculiarities of its colouring matters, which are referred to by Mohl in the "Vegetable Cell," p. 44. Mr. Lawson stated that in the blue (or purplish-blue) part of the flower, the colouring matter entirely consists of spherical granules of an intense blue or bluish purple colour, with occasionally cells containing similar shaped granules of bright crimson. All the granules of any one cell appear to be constantly of the same colour. In the yellow part of the flower, the colouring matter appears in a very different form. Instead of spherical granules, we have slender filaments, which are more or less spirally twisted and rolled up in various ways in the cell, resembling in their twisting the more delicate spiral fibres in the external cells of the roots of Epiphytal Orchids; but they are in many cases short, and form small round coils, giving the outline of globular bodies, which likewise, however, occasionally occur. While red and blue colouring matters usually occur in the vegetable kingdom diffused in the cell sap, we find them both in Strelitzia in a globular form. Although deceptive appearances often presented themselves, Mr. Lawson felt inclined to believe, from the examination of numerous specimens, that diffused colour did not at all occur in the flowers of Strelitzia. When the flower has attained its maturity, however, the cells are often so completely filled with the deep blue granules that they appear as a dense mass of blue, apparently homogeneous, matter in the interior of the cell. The flower should, therefore, be examined in the young state, not only before it has expanded, but long before the spathe has opened to expose it to the action of the light; even then the colouring of the flower will be found to have far advanced, but the cells not so completely filled with the blue globular granules as to disguise their character, and they are therefore distinctly seen. The cells containing the yellow filaments are generally of larger size, and more elongated in form than those containing blue or red globules.—2. On a species of Potamogeton from Lough Corrib, and other plants. By J. Kirk, Esq.—3. On the flowering of plants in the Royal Botanic Garden. By Mr. M'Nab. Mr. M'Nab communicated the following register of the flowering of certain hardy plants in the garden, as compared with the flowering of the same species during 1851 and 1853:—

	1854.	1853.	1851.

4. Illustrations of the application of "Nature Printing" to the copying of botanical specimens. By W. Lauder Lindsay, M.D.—William Milnethorpe, Esq., was elected an ordinary Fellow of the Society.

Reviews.

On the Atmospheric Changes which Produce Rain and Wind, and the Fluctuations of the Barometer. Second edition, with additional Essays and Diagrams. By Thomas Hopkins. London: Weale, 59, High Holborn; and Simms, Manchester.

The author observes, that at present the industry of meteorologists seems to be directed almost exclusively to the collection of facts. The great number of these, however, already furnished, justifies and invites an effort to discover the laws which govern the facts; this, he states, has been the object aimed at in the present work.

The theory of the winds, originally advanced by Hadley, and adopted by Dalton, Malte Brun, and now treated by Professor Forbes, and others, as the established theory, is not acknowledged by the author as being adequate to produce those strong winds which blow in some parts towards, and in others from, the tropics. "The heating of the surface of the globe and of the air near it, by the sun, is not a sufficiently powerful cause to produce those winds, though, like the law of diffusion, such surface heating may, and no doubt does, to a certain extent, bring into active operation another and a more powerful cause, and, as we shall see hereafter, one that is fully equal to their production.

"Unequal temperature is undoubtedly the great cause of the movements of the various portions of the atmosphere which constitute wind, but inequalities of temperature in our atmosphere are not produced merely by the partial heating of the surface of the globe, and of that portion of the air which is in immediate contact with it. The heat of the sun acts in two ways on the surface of the globe; one is by attaching itself to the matter of the earth's surface and increasing its temperature, which increase of temperature is, to some extent, communicated to the air which rests upon it, as stated in Hadley's 'Theory of Winds.' But there is another way in which the heat of the sun acts: it unites with water, and, by evaporation, forms aqueous vapour, without raising the temperature of the surface where the evaporation is carried on to the same extent that the temperature of dry land is increased; and the heat, thus united to the water, moves away from the part in the vapour, and through the operation of certain causes, is carried to a greater or less distance, where it is liberated, and produces effects which appear to have been, in a great degree, overlooked by writers on this subject, but which effects must be duly estimated if we are to understand the causes of the winds which are found to prevail in various parts of the world.

"In treating of the condensation of vapour and the heating of gases, it is observed, that supposing the dew point to be at 56°, an ordinary height in our summers, we shall find that the vapour will constitute not more than 1-100th part of the whole atmosphere, the remainder being formed of non-condensable gases. And as the vapour and gases are intermingled, and diffused through each other, the liberated heat produced by condensation would be attached to the gases, and only one part of it to the remaining vapour. The gases (constituting the atmosphere) would thereby have their elasticity increased; they would expand and rise to a greater elevation, and the remaining vapour being entangled with them would be carried by them to a higher and, consequently, to a colder region. In that higher and colder region, the same process would be repeated, vapour would be again condensed, heat liberated, the gases warmed and expanded, and another similar process commenced; and these processes would be carried on so long as there was a sufficient supply of vapour from below to feed them. The rapidity and energy of the process will depend on the extent of the supply of vapour, and of the power of cooling it. When the supply of vapour was small, and the higher part of the atmosphere warm, the process would be slow, and a mist or stratus cloud would be formed; when the vapour was more abundant, and the higher part of the atmosphere colder, the process would be more rapid, and cumuli might form, and rain fall. And if the supply of vapour was great, and the higher parts of the atmosphere very cold, the process would be violent, and heavy rain would be produced."

The different laws of cooling of the non-condensable gases and of vapour, produce important effects in the atmosphere. On the removal of incumbent pressure, and permitting expansion to take place, the gases cool, say 5°, whilst the vapour would cool only 1°. Through the operation of these different laws of cooling, the non-condensable gases, in their ascent to a height of, say 500 yards, will cool 5°, whilst the vapour that is within them is disposed to cool, by its own expansion, not more than 1°; but, as the different gaseous substances are intermingled, the cold of the former (those constituting the atmosphere) is communicated to the latter, and the vapour is condensed, not by the cooling consequent on its own expansion, but from that which results from the expansion of the (atmospheric) gases. Vapour, as it is formed, rises by its elastic force into the atmosphere, and would, by its own law of cooling, have its temperature reduced only 1° for every 500 yards of height, to which it ought to ascend; but it has to expand into, and pass through the interstices of the gases, which have a temperature that is found lower by 1° for every 100 yards of height. The vapour, in rising, is consequently cooled by the cold gases into which it has to expand, and thus condensation commonly goes on at some moderate elevation in the atmosphere, whilst evaporation is proceeding on the surface below. The condensation forms cloud, and warms the atmosphere in the part, and generally it will be found that the temperature in the newly-formed cloud will be only about one-half as much reduced by altitude as that of the neighbouring air, which has been undisturbed by condensation. When the atmosphere is thus heated, raised, and expanded in a particular locality, the adjoining more dense air presses into the comparative vacuum, and being in its turn heated, and a continuing ascending current created, more distant air rushes in, and thus a horizontal current of air is produced, and a *wind* is the result, and this wind is feeble or strong, according as condensation is moderate or energetic.

According to the author's theory, it appears, therefore, that the force of the wind does not depend so much upon the rarefaction of the air, by the direct influence of the sun's rays, as it does upon the condensation of vapour.

The principal feature of the work is the frequent recurrence to the condensation of vapour, for explanation of meteorological phenomena. Twenty-two essays are added to the present edition, and among them those on the Formation of Dew, Quantity of Vapour in the Atmosphere, Rain at Different Elevations, Pressure of the Aqueous and the Gaseous Atmospheres, Origin and Nature of the Causes that Produce Storms, on Climate, &c.

The concluding paragraph on dew is deserving of notice, especially as so much has been written on that subject by authors who have advanced very different theories respecting the cause of its formation:—

"We may then say that *Falling Dew* is produced by the descent of the cumulus or day-cloud, which, cooled by evaporation in a higher part of the atmosphere, sinks in the evening to the surface of the earth. *Floating Dew* is found in parts which have much vapour in the air in proportion to the temperature, along with a clear atmosphere, and when, consequently, radiation from the surface cools the atmosphere contiguous to it, and condenses a portion of the vapour which the air contains into minute globules of liquid, which are sustained by the elastic force of the air; whilst *Dew*, properly so called — that which is found attached to various substances in the form of drops—is a result of the cooling of certain bodies below the dew point of the atmosphere by radiation of heat from those bodies, and a consequent condensation and abstraction of some of the vapour which the air resting on them contained. And the more any body is thus cooled the greater will be the quantity of dew deposited on it. In the two last mentioned modes, dew supplies to a certain extent the place of rain. Where clouds are freely formed, rain falls to the earth to some extent; but when rain is absent, and the sky is cloudless, radiation of heat, by cooling and condensing vapour, gives some moisture to the earth. Thus the sands of Africa and Asia, which are never visited by rain, have their scanty vegetation supplied with a certain amount of that moisture which is so essential to the life of organised beings."

The work contains much interesting matter on the subject of Meteorology; and if not directly, yet certainly indirectly, much that may prove some day useful to mankind.

Garden Memoranda.

Royal Botanic Garden, Regent's Park.—The exhibition of American plants held here under canvas is scarcely so good this season as we have seen it in former years. Individually the plants may have flowered well, but as a whole they have certainly not been remarkably effective or striking, owing to the successional way in which the different varieties have come into bloom, of which there has never been so great an amount at one time as there was wont to be in more favourable seasons. The Azaleas are nearly over, while the broad-leaved Kalmias are scarcely yet in flower. Of Rhododendrons there is, however, a fair display, and any of the large standard specimens from Mr. John Waterer, of Bagshot, are of themselves well worth a journey of many miles to see, independent of the masses of smaller plants contributed by Messrs. Standish and Noble, of the same place, and Mr. Baker of Windlesham. The most brilliant by far in the first named group is "John Waterer," a variety remarkable for the very large heads of glowing deep crimson flowers which it possesses. It has also the advantage of being a free flowerer, and is reported to be sufficiently late to be out of the reach of spring frosts. Blandyanum is also a very brilliant kind, but it is scarcely late enough. Erectum, which is a shade lighter than John Waterer, is likewise a valuable kind. Blatteum, a variety bred from the last named sort, is one of the best of the Victoria family. It is a free bloomer, its trusses of flowers being very large. Lady Eleanor Cathcart resembles a Pelargonium more than anything else with which we can compare it. Its flowers are pink, with a dark blotch in the upper petals, and the trusses are large and handsome. Atro-sanguineum is good in colour; but the truss is somewhat loose, and it does not flower sufficiently late. Duke of Norfolk is a medium-sized pleasing rosy pink kind, without spot; and Elegans is a good rosy crimson, with apparently much of the Catawbiense breed about it. Omer Pacha, a new variety, very dark, and with a deep velvety tinge, is a seedling from Waterer's Victoria; it is, however, many shades darker than that sort, and is certainly more singular than beautiful. Among light-coloured kinds, Everestianum still holds a prominent place, not only on account of the beauty of its flowers, but the abundance with which they are produced. Cyaneum is a good dark kind, with a bluish tinge. Of spotted sorts, Leopardi, or perhaps more properly "the Leopard," is the best, and it is a very late kind. Waterer's Delicatissimum is a handsome light variety, as are also Album elegans, and Luciferum. Sherwoodianum is a good pale rose with a dark blotch. Duc de Brabant is new; it has white flowers slightly tinged with violet, and spotted with brown in the upper petals. It is in the way of Pictum, and perhaps scarcely so handsome.

The gem of Messrs. Standish and Noble's group is a new Belgian kind called Concessum. It has rosy pink flowers of the most vivid description, and excellent in shape and substance. The brilliancy of the pink in each floret is relieved by a pale centre, by which the general appearance of the truss is much improved. This is certainly a great acquisition, and one which cannot fail to be everybody's favourite. Among other sorts not mentioned above, a light kind called Ruth, and multimaculatum, were perhaps the most remarkable.

In Mr. Baker's collection the small lilac-flowered semi-double Hyacinthiflorum was in good condition. This makes a charming standard. A kind called Kalmioides has rosy lilac flowers, and foliage much resembling that of the broad-leaved Kalmia; maculatum grandiflorum is one of the best of the Victoria family. Versicolor is a pleasing sort; but it is not seen here in good condition. Nivaticum is a pretty white kind tinged with pink, and spotted with yellowish brown in the upper petals. Catawbiense splendens is also worthy of attention, as is also C. elegans. Baker's Delicatissimum is a handsome light variety, with more violet in it than Waterer's. Wilsoni and Ignescens, two brilliant new crimson kinds, are said to be very striking and handsome, but of these we only saw single flowers. We remarked a Kalmia in this group, with very deep coloured blossoms, and a prettily flowered plant of the dwarf Rhododendron ferrugineum.

FLORICULTURE.

Culture of the Dahlia.—I need scarcely remind amateurs that in order to be "well up" for exhibition purposes, the Dahlia should be planted in good strong soil, enriched by a liberal admixture of well rotted dung, and that the plants will be greatly benefited by placing a substantial mulching of the same material round their roots, which will feed on the fertilising liquid, washed down by every shower of rain with which they may be favoured. In order to be successful it is also indispensable that the young plants be strong and healthy, by being hardened and grown on slowly, but without receiving any check, for at least a month before planting, in a cool frame, to which air has been constantly and liberally admitted. The operation of staking should be performed either before planting or immediately after it. Though these conditions are, to some extent, known, and, what is better, acted upon, yet I have obtained such satisfactory results from their application, that wherever the Dahlia is cultivated I have no hesitation in recommending their adoption. In planting care should be taken to keep the ball entire, and to sink it but a trifle below its upper surface. I do not think that it is a good plan to form a basin or small trough for holding water, round the roots of the young plants. This should only be resorted to in very dry seasons, and, even then, not until the plants have made considerable progress towards completing their growth, for in a wet season like last summer, for instance, this method of planting induces a too rapid and, therefore, unnecessary growth, a condition which materially interferes with the quality of the flowers. From careful observation I am convinced that in proportion to the ripeness or otherwise of the trunk and laterals, are the chances that each variety will, or will not, maintain its true character. The fact that many of the leading varieties of last year failed to produce blooms of even average merit, ought to warn cultivators against the practice of furnishing their plants too copiously with an artificial supply of that element, from which, during a wet season, their succulent nature is but too susceptible of injury. The result of such treatment invariably is the production of a profusion of rank long-jointed shoots, instead of short-jointed thoroughly matured wood, from which alone anything approximating to good show flowers can be expected. *R. M.*

Royal South London Floricultural Society, *June* 13,—The weather on this occasion was very unpropitious, and the attendance small. One tent was wholly occupied with Pelargoniums, of which there were some good collections. The best came from Mr. Turner, of Slough, who had admirable plants of Esther, Queen of May, Mochanna, Magnet, Exactum, Medora, Astrea, and Arethusa. The same exhibitor had also six fancy kinds, consisting of Richard Cobden, Jenny Lind, Triumphant, Miss Shepherd, Madame Sontag, and Electra. Mr. Robinson, who was first in the amateurs' class, had Portia, Optimum, Exactum, Salamander, Star, and Novelty. This cultivator's fancies were Celestial, Delicatissimum, Jenny Lind, Princess Maria Galitzin, Fairy Queen, and Magnum Bonum. Some Pinks were shown, but they were stated to have been forced, to get them into bloom in time, and therefore they were not in very good condition. J. H. Baker, Esq., had Ruby and Koh-i-noor (Bragg's), Titus (Edwards'), Mary (Phillips'), Laura (Wilmer's), Prince Albert (Kirtland's), Countess Rosse (Read's), Sarah (Turner's), A. Morrison (Coster), Teddington (Bottle's), Colchester Cardinal (Norman's) and Mr. Cousins (Cousins'). Mr. Turner produced Rubens (Henbrey's), Pandora (White's), Prince Albert (Kirtland's), Arthur, Sarah, Optima, Esther, Hebe, and Perfection (Turner's), Rose Empress (Carter's), Mrs. Maclean (Maclean's), and Medora (Looker's). The following Pansies were also shown by Mr. Turner, viz., Duke of Norfolk, Earl of Mansfield, Flower of the Day, Mrs. Marnock, Pomona, Miss Talbot, Victory, Euphemia, Charles Turner, Royal Albert, Thisbe, Queen of the Isles, Lady Emily, Blanche

Memnon, Marian, Attila, Fair Rosamond, Satisfaction, British Queen, Monarch, Mr. and Mrs. Beck, Royal Visit, Pandora, Lady Carrington, Emperor, Caroline, Aristides, Royal White, Sultan, Miss Stuart, Sovereign, Mrs. Hamilton, Egon, and Sir J. Cathcart. Cut blooms of Pæonies and Irises were furnished by Mr. Salter, of Hammersmith, and there was a whole tent filled with stove and greenhouse plants. Seedlings chiefly consisted of Pelargoniums. A first-class Certificate was awarded to Phaeton, a vivid orange-scarlet with a bluish white throat, and upper petals blotched and edged with crimson, shape good; also to Serena, which we have described before. Other seedling Pelargoniums were Vesper, a white kind, blotched on all the petals with purplish crimson; Petruchio, Pandora, and Lord Raglan; the last a brilliant free-flowering sort, which, although not quite perfect as a florist's flower, will, nevertheless, make a good market plant. These were all from Mr. Turner, of Slough. Among Calceolarias, only one received a Certificate. It was named Pandora, a straw coloured ground kind, with mottled orange-scarlet blotch, and tolerably good shape, except that it was too large in the throat. It was shown by Mr. Clarke.

HAMMERSMITH PANSY SOCIETY.—At the late meeting of this Society the following prizes were awarded:—Class I., Nurserymen: 1st Prize, Mr. C. Turner, with 36 blooms, viz, Marion, Monarch, Euphemia, Flower of the Day, Royal Standard, Gliffe, Mrs. Hamilton, Memnon, Mrs. Talbot, Comet, British Queen, Lord Palmerston, Earl Mansfield, Satisfaction, Climax, Sir J. Cathcart, Blanche, Emperor, Uncle Tom, Pandora, Miss Stewart, Victory, Mrs. Mills, Pomona Superb, Royal Visit, Duke of Perth, Caroline, Mr. Beck, Fair Rosamond, Sir J. Paxton, Royal White, Lord John Russell, Marchioness of Bath, Thisbe, National, and Fearless. Class II., 2d Prize, Mr. W. Bragg, Slough, with Ophir, Post Captain, Hercules, Georgiana, Sampson, Marchioness of Bath, Lucida, Duke of Perth, Timour, Royal White, Polyphemus, Miss Talbot, Pandora, Royal Visit, Sir J. Paxton, Kate, Monarch, Velvet, Grace Darling, Mrs. Hunt, Androcles, Queen of England, Mr. Thompson, Bragg's Amelia, Great Western, Euphemia, Alfred the Great, St. Andrew, Dreadnought, Caroline, Mrs. Beck, Lady Carrington, Masterpiece, British Queen, Fearless, and Criterion. Class III., Amateurs: 1st Prize—Mr. Lane, Wycombe, with 24 blooms, viz., Royal Visit, Aristides, Mrs. Hamilton, Ophir, Euphemia, Egon, Emperor, Climax, Polyphemus, Aurora, Nonsuch, National, Queen of England, France Cycole, Exquisite, Duke of Perth, Duchess of Rutland, Timour, Addison, Keepsake, Lucy Neal, Marchioness of Lothian, Sambo, and Androcles. 2d prize, Mr. August, Beddington, with Duke of Norfolk, Queen of England, Joe Miller, Duke of Perth, Sir J. Paxton, Miss Talbot, Aurora, Commander-in-Chief, British Queen, Royal Visit, Mrs. Beck, Marchioness of Bath, Sir J. Cathcart, Maria Dickson, Master Lacon, Mrs. Hamilton, Ibrahim Pacha, Monarch, France Cycole, Ophir, Thisbe, Lucy Neal, Pandora, and St. Andrew. 3d Prize, Mr. Holder, Eton College, with Lucida, Mrs. Rouse, Sampson, Marchioness of Bath, Duke of Perth, Royal Visit, Kate, Alfred the Great, British Queen, Ophir, Mr. Thompson, Great Western, Ibrahim Pacha, Optima, Post Captain, Euphemia, Sir J. Paxton, Mrs. Coleridge, Mrs. Hunt, Fearless, National, Androcles, St. Andrew, and Monarch. Open Class, Seedlings:—First Class Certificates were awarded to Mr. Turner for Lord Palmerston, Memnon, and Satisfaction. Extra Prizes:—For the best six Yellow Grounds, 1st Prize, Mr. August, for Sir J. Cathcart, Duke of Norfolk, Robert Burns, Mr. Beck, Thisbe, and Pandora. 2d, to Mr. Holder, Eton College, for Timour, Pandora, Sir J. Paxton, Alfred the Great, Duke of Norfolk, and Mr. Thompson. For the best six White Grounds, 1st, Mr. Holder, Eton College, for National, Mrs. Rouse, Marquis of Bath, Royal Visit, Climax, and Queen of England. 2d, Mr. Lane, of Wycombe, for Aurora, Exquisite, Queen of England, Duchess of Rutland, Euphemia, and Climax. For the best flower in the exhibition the prize was awarded to Mr. Lane, Wycombe, for the variety called Egon.

Miscellaneous.

Kilmarnock Weeping Willow.—This beautiful weeping plant having lately attracted attention, its history may not be uninteresting. There lived, in a sequestered corner of Monkwood estate, near Ayr, an aged botanist, named James Smith, an enthusiastic lover of plants, and a zealous collector. From him Mr. Lang, nurseryman, Kilmarnock, purchased one plant, about 10 years ago. Afterwards Mr. Lang procured a few more plants from Mr. Smith; and as the old gentleman died shortly after, he never had an opportunity of ascertaining where he procured the variety. It is probable, however, that he found it growing wild, as the species, Salix caprea or Palm Willow, is one of the most common plants in the country. Mr. Lang has since been engaged in propagating the plant, and nearly 1000 have been sold. Sir W. J. Hooker received two plants of it in spring, 1852, and having observed, during last summer, how exceedingly ornamental it was, he gave Mr. Lang a decided opinion, stating that he thought very highly of it, and that it was much admired in the Royal Gardens at Kew. The tree flowers freely in the month of April, has broad glossy leaves, every branch is curved gracefully downward, and it is as hardy as the most hardy plant we have, being in fact a native of the country, and not, like the Salix Babylonica, introduced from a foreign clime. The name of Kilmarnock Weeping Willow was bestowed upon it to distinguish it from the common Weeping Willow, the Napoleon Weeping Willow, and the American Weeping Willow; it is quite distinct from either of these varieties, having leaves 2 inches broad. *Abridged from the Kilmarnock Journal.*

Vine Disease.—A M. Sainctelette announces that he believes that iron-salts applied to the roots of the Vine cure the disease. This is the result of four years' experience. He uses sulphate of iron in solution. *C. R.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—The beds of this house (if they have been properly made) will now require a large supply of water to keep them in a sufficiently moist state; and the soil should be occasionally examined, especially near strong growing plants, for the amount of moisture absorbed by these at this season is greater than many persons imagine. Whenever water is applied the beds should be thoroughly soaked to the bottom, and where it can be done without annoyance to the family, &c., manure-water should be given to such plants as are known to enjoy it. This should be furnished, however, in moderate quantities, and, after well soaking the soil with clean water; for to give it in large quantities would probably cause it to reach and injure some adjacent plant. If red spider makes its appearance upon any of the specimens growing in the borders the pot plants in flower should be moved as soon as possible, and the infested subjects given a thorough washing with the engine, and this should be repeated at short intervals until the enemy is thoroughly subdued. STOVE.—See that the specimens here are afforded plenty of space, for there is nothing more injurious than huddling growing plants together. The inmates of this house are mostly plants of easy propagation and rapid growth, and in many cases advantage is taken of this to grow too many for the accommodation at command, and the result is that there is hardly a respectable specimen produced. There can be no doubt that a moderate quantity of well managed specimens will be more valued than a larger number of half starved miserable looking subjects. Keep a sharp look-out for insects, and apply the proper remedies in time to prevent their injuring the plants. Attend frequently to the regulation of the growth of twiners, and prevent their getting into a state of entanglement. Maintain a brisk temperature with plenty of moisture in the atmosphere, and give plenty of weak clear manure-water to anything that is found to be benefited by it. ORCHIDS.—The shading of this house, during such weather as we have experienced of late, requires considerable attention to avoid extremes. Now, however, that the plants are mostly in free growth and very susceptible of injury from bright sunshine, it will be safer to err in the way of using the shading too much than to allow the plants to suffer from the want of it. Aim at securing rapid growth by keeping the house warm, and maintaining a regularly humid atmosphere, sprinkling the paths, &c., sufficiently often on bright days to keep them continually moist; but be careful not to get the plants too wet at the roots by using the syringe too freely over the foliage. See that specimens in baskets or on blocks are kept sufficiently moist, these will enjoy a slight dewing with the syringe morning and evening, whilst in a growing state.

FORCING DEPARTMENT.

PINERY.—Where Pines are grown on the Hamiltonian system (which, although it is undoubtedly the best where there is plenty of houses devoted to the culture of this fruit, is, in our opinion, altogether unsuitable where the accommodation is but limited, and a regular supply of fruit expected, because the individual plants are not sufficiently under control), a close watch must be kept upon the most likely plants for immediate fruiting, so as to keep them dry at the root, or otherwise, as circumstances may dictate; and those showing fruit must not be syringed over-head to the extent of causing water to lodge in the centres of the plants, for this would probably cause the fruit to be deformed. Young stock growing in dung pits must be allowed plenty of air, to prevent their making weakly growth, and must not be over-watered, which, through the greater amount of moisture in the atmosphere, is more apt to be the case here than in houses heated by any other means. Encourage recently-potted stock with plenty of warmth, and a corresponding degree of humidity in the atmosphere, but water carefully until the roots get hold of the fresh soil. The most certain method of obtaining a regular supply of fruit is by securing and potting a limited number of suckers at short intervals throughout the growing season; therefore attend to this, which will save much trouble and disappointment as compared with the old practice of doing this but once, or at the most twice in the year. VINERIES.—Where Grapes are intended to be kept until next January the berries should be thinned, so that they will scarcely touch after they are fully swelled, for it is hardly possible to prevent their damping off during winter, when the berries are left as thick as is usually done for summer and autumn use. Muscats and St. Peter's will be benefited by a little fire-heat at night until the weather becomes warmer than it is at present. Spare no trouble to preserve the foliage of the early house in a healthy state, for, at least, the next two months; and also see that the border is not allowed to become too dry. Give air freely, and early in the morning where the fruit is colouring, and avoid an undue amount of moisture in the house by removing plants, &c., at any inconvenience. FIGS.—Immediately the first crop of fruit is gathered, give the borders a thorough soaking with soft water, for if these are allowed to get very dry at the roots at this season, it will be extremely difficult to preserve the foliage from the attacks of red-spider. Those growing in pots can hardly have too much manure water, except while the fruit is ripening. Give air freely in the fore part of the day, but shut up early in the afternoon, after syringing and thoroughly moistening the borders, passages, &c.

FLOWER GARDEN AND SHRUBBERIES.

On light dry soils many things will be greatly benefited by a thorough soaking of water, especially coniferous plants, most of which make but one growth during the season, and should be encouraged at the proper season, where rapid growth is wished. This attention will be especially necessary in the case of young specimens growing on lawns; one of which we have just removed to-day, and found the soil very much drier than we were prepared to expect. If Stocks, China Asters, &c., are not already planted out where they are to flower, take advantage of the present cool, showery weather to do this; and attend to them with water, &c., for a few days, until they become established. See that Dahlias, Hollyhocks, &c., are properly staked and kept tied up, to prevent their being broken by sudden storms. Stir the surface of the soil among the "bedding-out stock," which will prevent the growth of weeds, and greatly encourage the growth of the plants. Select a few plants from the reserve stock of the more difficult to winter kinds of bedding things, pot them in 7-inch pots (using rather poor sandy soil), and plunge them in a bed of sand. These, with an occasional stopping, will make nice little plants in course of the summer, and will be very easily carried over the winter, and may come in very useful next spring for supplying cuttings.

HARDY FRUIT AND KITCHEN GARDEN DEPARTMENT.

Where the quantity of Peas already sown is not considered sufficient for the autumn supply, sow an early variety on deep, heavily-manured soil. Fairbeard's Surprise we have found an excellent variety for planting at this season; it is a vigorous grower, and good in quality. After the showers which we have had, the ground is in a good state for planting out winter greens, &c.; therefore, get the Brussels Sprouts, Snow's Broccoli, German Greens, and a small breadth of Savoys, &c., planted out as soon as possible; and do not forget Couve Tronchuda, which is the best of all our autumn greens. Also get Leeks planted, if sufficiently strong for removal, affording them an open piece of very rich deep soil. Attend to keeping up a succession of salad. Where it can be done, Lettuce should be planted on a north border at this season, as it is difficult to have these crisp and tender in hot weather, if they are fully exposed to the mid-day sun. Sow Endive for Autumn use; also Onions to draw young for salading, and take care to provide plenty of Parsley for winter use, by sowing a good breadth on light rich soil. Celery, if not already strong, must be carefully attended to with water, so as to have the main crop ready for planting out early next month. Persevere in the destruction of weeds, and endeavour to keep every corner clean and neat.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending June 15, 1854, as observed at the Horticultural Gardens.

June.	Moon's Age.	Barometer.		Temperature. Of the Air.			Of the Earth		Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean	1 foot deep.	2 feet deep.		
Friday 9	13	29.961	29.929	64	46	55.0	54	55	N.W.	.00
Satur. 10	○	29.908	29.881	66	40	53.0	55	56	W.	.00
Sunday 11	15	29.8[illegible]0	29.654	65	55	60.0	55	55½	S.W.	.01

Thurs. 15	19	29.720	29.662	60	50	55.0	56½	57	E.	.04
Average.		29.781	29.706	64.7	48.0	56.3	55.3	56.1		0.23

June 9—Overcast throughout.
— 10—Cloudy and fine; clear and fine at night.
— 11—Fine; rather windy; cloudy; uniformly overcast.
— 12—Densely clouded; very clear at night.
— 13—Rain; clear at night.
— 14—Cloudy; very fine; partially overcast; rain.
— 15—Drizzly; hazy and drizzly; dusky haze in afternoon.
Mean temperature of the week, 4½ deg. below the average.

RECORD OF THE WEATHER AT CHISWICK,
During the last 28 years, for the ensuing week, ending June 24, 1854.

June.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 18	72.8	51.1	61.9	15	0.30 in.	2	2	2	2	4	6	8	2
Mon. 19	71.0	49.6	60.3	14	0.37	1	3	1	2	1	4	10	6
Tues. 20	72.3	51.0	61.9	12	0.21	1	4	1	1	1	7	7	1
Wed. 21	74.1	51.2	62.7	12	0.68	2	3	1	3	1	13	4	1
Thurs. 22	72.9	49.0	60.9	12	0.59	2	1	1	1	2	10	8	3
Friday 23	73.6	49.3	61.5	12	0.44	1	1	3	10	3	2	5	3
Satur. 24	73.7	50.3	62.0	11	0.49	—	2	4	1	2	11	7	1

The highest temperature during the above period occurred on the 19th and 22d, 1846—therm. 93 deg.; and the lowest on the 23d, 1851—therm. 35 deg.

Notices to Correspondents.

BOOKS: *T M.* M'Intosh's "Book of the Garden," and Sweet's "Greenhouse and Hothouse Cultivator."—*H H.* The "Manse Garden," with Paxton's "Cottagers' Calendar," or Neill's "Fruit, Flower, and Kitchen Garden," may possibly answer your purpose.‡

CALLA ÆTHIOPICA: *J W.* Where there are plenty of plants this may possibly be had in bloom nearly the whole year round, by forcing some into flower early in spring, and retarding the blooming of others till late in autumn. It will however, require a season's experience to be able to effect this satisfactorily.‡

CUTTINGS: *Petro.* We don't know "what is the most attractive substance for eliciting roots from cuttings of plants."

DISEASES: *Ivenensis.* The Grape leaves are in a complete state of chlorosis. It is quite impossible that there can be such a deficiency of light in your house as to bleach the young leaves so completely, and we therefore conclude that the cause must reside in the roots, whether due to natural decay, constitutional weakness, or, what is equally possible, to some defect in the soil, of which it is impossible to form any correct judgment, except on the spot. That the root is the source of mischief we have no doubt, and to that therefore we should recommend you to direct your attention. *M. J. B.*

GARDEN SEATS, &c.: *Rusticus.* Of the two, stone colour would look best for your garden seats and flower stands. As regards your pond, you must cut off the supply of the water which brings offensive matter into it.‡

HOTHOUSES: *E S B.* The plan of making the front lights all move at once has been fully tested at Frogmore and other places, and has been found to answer perfectly. ‡

INSECTS: *E B.* The fly you have reared from the Dock leaves is one of the nearly 200 species of Anthomyia (Musca pars, Linn.); it is nearly allied to A. fungorum, whose history is given in *Gard. Chron.*, 1853, p. 581.—*Medicus.* From your description the animal you mention is the Gordius aquaticus.—*R V.* Your queries on aphides on the Gooseberry shall be answered next week. *W.*

NAMES OF PLANTS: *J H.* 1, Lastrea dilatata; 2, Pteris aquilina. These are young plants (fronds) of two common British Ferns, drawn up delicate by being in a stove; 3, Adiantum cuneatum. *S. —H G, and another.* Next week.

PINE-APPLES: *Sub.* If you will refer to p. 324 you will find that your question has been answered. ‡

STRAWBERRIES: *S B.* The fruit of your seedling is very large; in appearance it much resembles the Elton, but the flesh is not so solid, and the flavour of the specimens received is not sufficiently rich to justify a recommendation of the sort; it, however, deserves further trial in the open ground. ‡

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

TO AMATEUR FLORISTS, GARDENERS, ETC.

H. COLES & CO. beg to inform Floriculturists, &c., that their celebrated POT MANURE, which has given general satisfaction for so many years, may be obtained of the following Agents in packages, at 20s., 10s., 5s., 2s. 6d., 1s., and 6d. each. For Amateur Rose, Fuchsia, and Chrysanthemum Growers, it will be found one of the best Manures yet introduced.

Agents:—Mr. G. Lawrence, Seedsman, Piccadilly; Mr. Hooper, Centre Avenue, Covent Garden; Mr. Gaines, Herbalist, Covent Garden; Mr. Wood, Seedsman, High Street, Marylebone; Mr. J. H. Tuck, Florist, Sloane Street, Chelsea; Mr. Rickets, Corn Chandler, Victoria Road, Pimlico; and Mr. Gibbs, 14, Portland Road.—Depôt, Albert Wharf, 10, Wilton Road, Pimlico.

THE "ECONOMICAL MANURE."

All orders for this valuable Manure promptly executed. Delivered free on to the Railways in LONDON, MANCHESTER, or BIRMINGHAM, at 12s. per cwt., packages included.

B. COVENEY, Manager.

British Economical Manure Company's Offices,
No. 10, Mark Lane, London.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.

WM. INGLIS CARNE, 10, Mark Lane, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.

Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4l. per ton, and in quantities less than half a ton, at 5s. per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London: and from all the other Agents of the Company.

GUANO (PERUVIAN) AND CHEMICAL FERTILISERS.—NITRATE OF SODA; PERUVIAN GUANO; SUPERPHOSPHATE OF LIME; AGRICULTURAL SALT; AND CONCENTRATED MANURE FOR TURNIPS.

The above articles are supplied on the lowest Cash Terms, for best qualities only, on application to Mr. JOHN CLARANCE, Agriculturists' London Agent, 1A, Bishopsgate Street Within.

TURNIP SOWING.

SUPERPHOSPHATE OF LIME, made from Bone, which is the best Manure for Root Crops (see the Royal Agricultural Society's Journal, Vol. vi., part 2). PERUVIAN GUANO, NITRATE OF SODA, BONE DUST, SULPHURIC ACID, and all other Manures of known value. The PEAT MOSS CHARCOAL COMPANY have appointed the undersigned Sole Agents for the Sale of this fixer and distributor of Ammoniacal matter. They are also Sole Agents (in London) of the Patent Sanitary Company for the sale of their "Nitrogenised Carbon."—Apply to MARK FOTHERGILL & Co., 20A, Upper Thames Street, London.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

SCYTHES.

BOYD'S PATENT SELF-ADJUSTING SCYTHE will last out three of the ordinary sort, and is always ready for use.

"We have seen this Scythe at work, and can strongly recommend it."—See *Mark Lane Express*, May 16, 1853.

To be had of every Ironmonger and Nurseryman in the kingdom; and wholesale and retail of WM. DRAY AND CO., Agricultural Implement Makers, Swan Lane, London.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

SAMUELSON'S PRIZE FORKING or DIGGING MACHINE, as applied to Spring Cultivation, serves to thoroughly pulverise land which has been trodden by sheep or autumn ploughed, deepening the staple, leaving no pan, dragging up the Couch Grass, and preparing a finely divided seed-bed.

Extracts of Testimonials and references to persons using it.

"Answers thoroughly; brings everything to the surface."—*E. W. Wilmot, Congleton.*

"The very best a man can have upon a mixed or stiff soil, it so thoroughly pulverises it."—*Joseph Cooper, Acton Burnel, Salop.*

"I inform you, with the greatest satisfaction, of its success."—*Francis Hamilton, Friars Place, Middlesex.*

"Attached horses at half-past 8, on 5½ acres, finished at a quarter past 3, making first-rate work."—*J. Kirby, Bodicott, Oxon.*

"Has been working every day."—*T. Cardus, Barwell, Surrey.*

"Will do a given amount of labour, not only cheaper but better than the plough."—*J. J. Mechi, Tiptree, Essex.*

"Let me have one at your earliest convenience."—*Earl of Essex, Cassiobury, Herts.*

"Send to Exton Park one of Samuelson's Forking Machines for *Earl of Gainsborough, Oakham.*"

"Besides improved tillage, economises ploughmen."—*P. Gener, Cuba.*

"Been digging all the week; the *champion* of all implements in England; should be very sorry to be deprived of it."—*Thomas Lawrence, Thurlaston, Dunchurch.*

"Well satisfied last year. Turnips were a superior crop."—*C. Brickwell, Overthorpe, Northamptonshire.*

Price 24l. 10s., the general purpose size; and 27l. 10s. large size, Cash: at the Works, Banbury.

TESTIMONIAL TO J. B. LAWES, ESQ., OF ROTHAMSTED.—The Acting Committee beg to direct the attention of Gentlemen interested in Agricultural Improvement to their Advertisement in the *Gardeners' Chronicle* of April 8, and to the Editorial notice in the same Journal of April 22.—Further information may be obtained by application to St. Albans, June 17. W. KERL, Hon. Sec.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.

PROFESSORS, &c.

Chemistry—J. A. C. Voelcker, Ph D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S.; F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.

The next SESSION will begin early in AUGUST. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40l. per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

The GUIDE TO THE ROYAL AGRICULTURAL COLLEGE FARM may be obtained of HAMILTON, ADAMS, & Co., Paternoster Row, London; and EDWIN BAILY, Cirencester. Price 1s.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.—The Society's SHOW AT ARMAGH, in the Province of Ulster, will take place on the 9th and 10th of AUGUST next, when Premiums and Cups to the amount of 1200l. will be offered to competition for Farm Stock, Implements, &c. All entries must be lodged not later than 19th July.

Prize Sheets, and Forms of Entry, to be had on application to ROBERT COCHRAN, Esq., Secretary to the Local Committee, Armagh; or, to me, at the Society's Offices, 42, Upper Sackville Street, Dublin. THOMAS HARKNESS, Secretary.

YEOVIL POULTRY SHOW.—This Show will be held on Wednesday, the 20th of September next. On receipt of a postage stamp the Prize List will be forwarded on application to Mr. JOHN GLYDE, Solicitor, Yeovil, Hon. Sec.

The Agricultural Gazette.

SATURDAY, JUNE 17, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, June	21	Agricultural Society of England—Professor Way's lecture.
THURSDAY,	—	22—Agricultural Imp. Society of Ireland.
WEDNESDAY,	—	28—Agricultural Society of England.
THURSDAY,	—	29—Agricultural Imp. Society of Ireland.

WE learn that the Wheat on the south coast (Sussex and Hants) is very much affected with "rust." No remedy is known for its attacks; but so long as they are confined to the leaves, they are not often seriously injurious. In the Eastern Counties we hear that the crop is suffering from a mould or mildew for a few inches up the stem from the root. We shall be much obliged for information on this very important subject, from those of our readers who have on previous occasions kindly given us reports.

IN another column will be found a short official report of the lecture on Charcoal and other Deodorising Substances, delivered by Professor WAY, at the rooms of the Royal Agricultural Society of England, on Wednesday. The main points insisted on were—(1), the distinction to be observed between the process of deodorising and that of retaining the volatile products of the putrefactive process—(2), the absorptive power of charcoal as dependent on its porous structure, and on these pores being open to the gases thus absorbed—(3), and, lastly, the peculiar structure of animal charcoal as compared with that of vegetable origin, to which it owed its greater power as a decoloriser for the sugar refiner.

On the first point it was remarked that the loss of the material of which the sense of smell took cognisance was not necessarily of any importance. A grain of musk was undiminished in weight after it had filled the room with its odour for years. And, so, the mere fact of manure smelling was not, in itself, proof of any material loss. Nevertheless, it was found that, if the gases resulting from the process of putrefaction were fixed, the peculiar odoriferous matter of the manure appeared also, in a great measure, to lose its volatility; and so smell became, if not exact testimony, at least, a tolerably trustworthy index to the loss of valuable matter.

The second remark had this important practical bearing, that while in air charcoal absorbed many times its bulk of many gases—that of ammonia, for instance—in water this power was altogether lost. Charcoal will absorb ammoniacal and other gaseous products of putrefaction, and these are rapidly decomposed in its pores, but fill those pores with water, and their gaseous occupants are at once expelled; and the only power which it then possesses will be that of a sponge holding so much liquid with whatever matter may be dissolved in it. To pass liquid through charcoal, in order to its ammonia being detained, is therefore most mistaken; the liquid will come out of it of the very same composition in every respect as it had before entering it.

The third point had only an indirect agricultural bearing. The peculiar porosity of animal charcoal is due to the separation of the charcoally by the mineral particles of the bone. This has been very ingeniously attempted to be imitated by Mr. WAY, by saturating the now well-known silica rock of Mr. PAINE'S estate at Farnham (which rock is exceedingly light and porous) with tar, and exposing it to destructive distillation, by which means the resultant charcoal is distributed amongst the mineral substance of the rock, much as it is in the case of animal charcoal amongst the mineral substance of the bone. And the decolorising effect of the charcoal in that state is very materially increased. Whether or not it may compete with animal charcoal for the purposes of the sugar refiner seems doubtful; but, if by its use it should reduce the value of animal charcoal below the price at which farmers could afford to purchase, it is clear that the ingenuity of Mr. WAY and Mr. PAINE will have proved, in this as in other more important instances, agriculturally beneficial.

ADULTERATION OF GUANO.—In a lecture recently delivered before the members of the Royal Agricultural Society of England, I had occasion to remark that the adulteration of guano had this year reached a height to which it had in no previous season attained. You will understand that I did not speak without knowledge on this subject, for the number of analyses of manure necessarily passing through my hands enables me to form a very fair opinion of the state of the manure market at any particular time.

Several circumstances have conspired to offer this spring to the adulterators of guano a more promising field of exertion than usual. In the first place, from causes into a consideration of which I need not enter, the supply of guano from Peru was, especially at the early part of the season, very limited. The importers could not meet the demand, and were obliged to refuse orders. Even at this moment I find that guano is selling in many places in the country at 13l. to 14l. per ton. In ordinary years the demand for one kind of manure bears some relation to the supply of manures in general. Thus if one article upon which the farmer is wont to rely is not forthcoming, he turns to another. If he cannot get guano for his green crops he will try superphosphate of lime, or *vice versa*—there is, in fact, a certain equivalency in different manures which regulates the demand for them. After guano, superphosphate of lime is perhaps the artificial manure of greatest consumption. It has happened, however, this year that there has been a particular scarcity of the raw materials of this manufacture. Bones have been scarce—guanos of the phosphoric kind, which at other times have been most valuable to the superphosphate maker, have all but disappeared; whilst the supplies of coprolites, which form really our natural source of phosphoric acid, have so fallen off that the price has been more than doubled; and they were at one time, from their excessive cost, almost out of reach of the manure maker. The dealer in superphosphate of lime, as well as the guano merchant, has found himself this year in the enviable or unenviable position, as it may be, of refusing orders. Here, then, was a glorious opportunity of making money, which the dealers in adulterated manure were not likely to let slip: farmers rushing to the manure market, only too

glad to get supplies of manure, and not over-careful, if the truth must be told, to ascertain whether it was good or bad; and, on the other hand, the nefarious dealer, not even driven to the necessity of adopting a low price to obtain a sale, but revelling in a ready market and enormous profits. In this way many a ton of good guano becomes 3 or 4 tons of a manufactured article. For my own part, I feel convinced that the demand for artificial manures is increasing, and will increase to an enormous extent. No one can well form a notion from the demand this year, what it may next year become; but it is precisely this circumstance, coupled with the fact that the supply does not increase in anything like proportion with the growing requirements of agriculture, that should point out to us the necessity of looking very closely after those who are entrusted with the trade in manures.

As I have before had occasion to show, the dealer in manufactured guano has three or four principal raw articles, to one or more of which he has recourse in his trade. Undoubtedly his favourite ingredient is gypsum—more especially that which in several manufacturing processes is artificially produced—this variety of gypsum, being precipitated, is in fine powder, so that it mixes readily with the guano, and is not liable to the awkward exposure of its presence in the mixture by an accidental crystal, which has escaped the vigilance of the manufacturer. Besides, it does not want crushing, and herein is an extra economy. The chief recommendations of gypsum, however, are, first, that it *burns white*; secondly, that, even when quite dry, it contains water, which burns off at a red heat. Now, good guano burns white when heated sufficiently long; gypsum does not interfere with this whiteness. Good guano loses much weight by burning, and the farmer might perchance have resort to this mode of learning whether or not he has been honestly served; but as gypsum accommodates itself to these circumstances by losing weight when burned, the proof is not so easy.

These are quite sufficient reasons why the guano adulterator should cherish gypsum as his most useful and indispensable ally. Common salt is another resource of the refined adulterator; it also burns white, although it does not, as gypsum, lose weight on burning. Sulphate of soda has lately, I find, been used, and it has, unfortunately, some advantages to recommend it. Coprolites finely powdered form another source of adulteration, and inasmuch as they contain phosphate of lime, one of the natural ingredients of guano, the dishonest dealer may perhaps soothe his conscience by persuading himself that he is not, after all, doing his customers so great an injury as we would have them believe. I need not occupy the time of your readers by answering such sophistry as this (which I have, in fact, heard put forth on more than one occasion), for, independently of the fact that coprolites in their natural state are of no earthly use to vegetation, and that they can at all times be bought for less than one-third of the cost of guano, I say, quite apart from these circumstances, adulteration is adulteration all the world over, and nothing can make those who practise it other than dishonest and disreputable persons.

As matters stand now, coprolites are not likely to be used largely in adulterating guano, on account of their price; neither are they so much esteemed in the adulterating trade, because they burn red, and their presence is more likely to be discovered.

But if the dealer is of an ambitious go-a-head character—if, scouting the refinements of his competitors, and relying, as he frequently may do with perfect safety, on the blind confidence and penny-wise policy of the farmer, he is determined to make the largest amount of profit in the shortest time, he straightway betakes himself to the nearest sand or loam pit.

Sand, I believe, unless very fine, is not well suited to the adulterating dealer's purpose; he prefers a clay, provided that it be so mixed with sand that it will dry and work well. Your readers will remember that two years ago an organised factory, with drying stoves, reverberatory furnaces, and grinding mills, and all the requisites of a large manufacture, was in full work at, or near, Bow Common, for the sole purpose of preparing clay or loam for the use of the guano manufacturer. Here you might have bought every variety of dry loam, with shades of colour to suit the adulterator and the market, whose tastes he had to study. Has this manufacture been discontinued? Have we any reason to suppose that what was profitable then is less so now? I cannot say; but this I can speak with certainty about, that large quantities of guano are still adulterated with loam, wherever it may come from.

I do not propose to discuss the question of the loss which the agriculturist individually and the community at large suffer by these frauds. If this truth is not present to every one's mind without explanation, I feel that I do not possess powers of argument to make it so. I will therefore simply give you a few results of the different forms of adulteration that have come before me this spring. I shall, however, first of all give the analyses of some half dozen good specimens examined this year, to show that the average composition of Peruvian guano has suffered no alteration, and that no diminution of value has, in the last few years, occurred with this valuable manure.

The following are the analyses of six samples of guano received from different parts of the country, and taken at random from my laboratory book.

ANALYSES OF PURE PERUVIAN GUANO, EXAMINED IN THE SPRING OF 1854.

	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.	No. 6.
Moisture	12.02	14.70	15.37	16.75	22.26	8.29
Organic matter and salts of ammonia	51.82	52.09	49.69	50.66	46.99	57.31
Sand, &c.	2.45	1.19	1.25	2.29	1.28	1.12
Phosphate of lime and magnesia	27.69	21.72	22.38	18.50	21.52	21.93
*Alkaline salts	6.02	10.30	11.31	11.80	7.95	11.35
	100.00	100.00	100.00	100.00	100.00	100.00
*These alkaline salts contain phosphoric acid, making the total phosphate of lime	33.21	31.39	30.00	26.11	27.21	33.28
Nitrogen	13.98	14.61	14.34	13.68	12.69	14.17
Equal to Ammonia	16.91	17.74	17.41	16.61	15.41	17.20

The sample No. 5 is certainly below the average composition of best guano, but this arises evidently from the dampness of the sample; it was obviously a cargo or a portion of a cargo slightly injured by sea-water.

I am justified, therefore, by the result of recent experience in the composition of genuine Peruvian guano, in saying, as I did several years ago, that it *averages* fully 17 per cent. of ammonia. From this composition it has not varied in the course of several years—a circumstance which is of the utmost importance, as furnishing us with a standard of comparison wherewith to try sophisticated samples.

I will now give you the analyses of a few adulterated specimens in which the chief or only addition has been gypsum.

ANALYSES OF GUANO ADULTERATED WITH GYPSUM.

	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.	No. 6.
Moisture	8.97	11.30	11.67	11.57	11.22	8.41
Organic matter and salts of ammonia	29.49	30.65	23.66	18.65	22.36	18.58
Sand, &c.	1.97	2.00	2.01	2.97	1.64	1.65
Phosphate of lime and magnesia	19.51	26.48	23.02	18.09	24.24	14.20
Hydrated sulphate of lime (gypsum)	35.81	20.91	31.97	38.42	37.19	53.53
Alkaline salts	4.25	8.66	7.67	7.02	3.35	3.63
Carbonate of lime	...	...	...	3.28	...	...
	100.00	100.00	100.00	100.00	100.00	100.00
Nitrogen	7.70	7.54	8.85	5.06	6.23	5.83
Equal to Ammonia	9.35	9.15	10.74	6.14	7.56	7.08

Here you will observe that the adulteration has ranged from 20 to more than 50 per cent. of gypsum; and it is difficult to say why the whole composition of the guano is not altered in precise relation to the adulteration—that is to say, if 50 per cent. of gypsum be added, the ordinary substances—phosphates, ammonia, &c., should be present in just half the usual proportion. This is not exactly the case, although there is an obvious relation between the ammonia and the gypsum—the one going down as the other increases in per centage. I am inclined to think that, in many cases, the adulterators get hold of damaged guano, which would account partly for the discrepancy; or that they, perhaps, add a portion of a naturally inferior guano, not of the Peruvian type. But the facts, as they stand, are near enough for all practical purposes; these analyses indicate a value in the case of Nos. 4, 5, and 6, of about one-half, and in the other samples of six-tenths of real Peruvian guano.

The following are analyses of adulterated guano, in which sand and clay have been employed in addition to sulphate of lime:—

SAMPLES ADULTERATED WITH GYPSUM AND SAND OR CLAY.

	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.	No. 6.
Moisture	5.50	9.12	8.53	19.45	7.45	9.93
Organic matter and salts of ammonia	16.42	14.19	18.89	7.10	8.62	20.87
Sand and clay, &c.	27.80	48.87	26.80	18.67	35.53	13.89
Phosphates of lime and magnesia	12.24	16.10	16.19	24.17	6.04	19.68
Hydrated sulphate of lime (gypsum)	11.86	7.97	25.00	20.66	29.12	29.08
Alkaline salts, &c.	11.23	3.75	4.59	9.95	13.24	6.55
Carbonate of lime	14.89	...	...	...	...	...
	100.00	100.00	100.00	100.00	100.00	100.00
Nitrogen	2.91	3.14	4.48	1.82	1.11	4.83
Equal to Ammonia	3.53	3.81	5.44	2.21	1.34	5.86

You will see by this table that you are far better off with the gentlemen who only use gypsum, than when you come to those who use clay or sand as well; for the character of the manufactured article in these last instances is infamous. The sample No. 5 is not worth, at the highest estimate, 2*l.* a ton; whilst no doubt, if the truth could be got at, it was sold *a bargain* at 11*l.* per ton.

I could add very many to the number of these analyses, but your readers will be already sufficiently disgusted with the detail. I shall simply state that, although for obvious reasons I give no names or particulars in respect to these analyses, they could in each case be authenticated if necessary. The samples have come to me for analysis in the ordinary way of business, and without any seeking or solicitation on my part.

If you should be able to afford me the space, I will, in a future number of your Journal, point out how far the agricultural public possesses a remedy for this most crying evil. J. THOMAS WAY.

ON SOWING MACHINES.

(*Concluded from page* 347.)

THE fourth method of delivery is adopted in a good many sowing machines, such as some of our dibbling machines, Vingoe's seed planter, and others. It consists in the oscillating movement of a false bottom to the seed box. The holes in the true bottom are covered by a thin false bottom, in which, however, there are also holes of similar size, and of a depth corresponding to the thickness of the material; these holes become filled with the seed in the box, and when, in their lateral sliding movement, they coincide with the holes below them, of course the seed falls out to the ground. There would be an escape of more than the mere contents of the hole, were it not that close upon the upper sliding piece, and immediately over the holes in the lower fixed piece, there is a brush or other impediment to the escape of the seed; so that the sliding holes do in effect come from under these brushes, get filled with the seed, and then pass under the brushes again, where the holesful of seed escape through the bottom of the box.

In some machines this motion of what I have called the false bottom is a lineal oscillating movement; in others, it is a rotatory movement, the upper plate revolving over the lower fixed one, and the seed falling through the latter into tubes, conducting it to its place on or in the ground. In all, the quantity sown depends upon the size of the moveable holes, and the frequency of that coincidence between them and the fixed ones, on which the exit of the seed depends; and, as both of these circumstances are easily under control, this would seem to be an efficient method of delivery; its fault, however, is that the seed is often cut by it, the edges of the sliding pieces coming into work scissors-fashion in a very undesirable manner. Where the coincidence of the holes is produced by a rotatory motion, it is easy to imagine how that of the driving wheels, at right angles to the ground, can be communicated to the horizontal circular plates by bevel wheels; where it is by an oscillating movement, it is effected either by a crank movement, just as the oscillation is given from the driving wheel of a winnowing machine to the riddles, or by a zig-zag flange upon the shaft of the driving wheel of the machine, which guides a stud upon the oscillating piece, and, of course, insures its to-and-fro movement. Of all these four styles of delivering seed, the third is believed to be the best for the safe, uniform, and easily regulated manner in which it performs its work.

I now refer to the second part of sowing machines—that by which they conduct the seed to its place in or on the ground. It does not need many words to describe this. In broadcast sowing machines, the holes in the bottom of the long seed box being equidistant, and the delivery from each being uniform, the even spread of the seed on the surface of the land is insured by the box being sufficiently elevated above it, and the seed being left to find its own way unguided. The broadcast machine has, in fact, no part corresponding to that which we are now considering. In drilling machines the seed is not left thus unguided, but each hole delivers it into a funnel, by which it is guided to a single row on the surface of the land, parallel, of course, to the forward motion of the machine; and this funnel terminates in a heavy coulter, which, sinking in the ground by its weight, or being forced in by pressure, opens a channel on the surface, into which, as the seed falls, it is thus placed in a row beneath the surface, and being then covered by a harrow, the operation of sowing is completed. These funnels and coulters need to be lifted now and then, either to enable them to surmount obstacles, or for the purpose of cleansing them from weeds, or to enable the machine to be turned at the land's-end; and for this purpose they are generally made in pieces, cup-shaped, fitting into one another, and hanging the one from or on to the other, so that the whole is easily lifted, the lowest, when it is pulled up completely, containing all the others, and yet permitting a free passage through all. This absence of rigidity enables not only this lifting of the whole at the land's-end, but permits every coulter to accommodate its position to unevenness in the land. Latterly, tubes of India-rubber have been to some extent used by Mr. Hornsby, of Grantham, in place of these funnel-shaped cups, and only the bottom coulter then needs to be lifted. One objection to these cups, to meet which, indeed, Mr. Hornsby's flexible tubes were employed, arises from their shallowness. A lateral gust of air thus could find its way into them, and disturb the

uniform delivery of the seed. The lower edge of one cup too would sometimes get over the upper edge of the cup immediately below it, and thus not only destroy the flexibility and telescope-slide character of the apparatus, but spill the seed outside the proper line of delivery. This objection has been obviated by Messrs. Garrett, by means of the greater depth of tube with which each cup is now furnished, and by which its continuity with the others is now insured. Messrs. Marychurch & Son, of Haverfordwest, have insured the same thing, and done away with the need of the suspending chains, by which the tubes are held together when hanging fully extended, by spreading the lower edge of each cup, and contracting the upper edge of each, so that on being lifted the former catches the latter. The cups are of course made in parts, which are put together when the whole series is being connected, for when once made they are not separable except by breakage; and if stretched as when at work, they form a tube which wind cannot enter, and whose continuity cannot be broken. I mention this modification of the delivery tubes, as it was exhibited at the last meeting of the English Agricultural Society, although I do not know how it has stood the test of experience in the field, where, by the way, the apparent complexity of chains, and other jingling pieces in a Suffolk drill, is not, in practice, found so real a hindrance or misfortune as might have been expected.

But there are machines which do more than merely conduct the continuous stream of seed, and lay it thus in lines beneath the surface of the soil—we have dibbling machines, which cut this continuous stream in portions, as it were, depositing every separate portion not only in one line, but in distinct and equidistant positions on that line; and the method by which this drop-drilling and dibbling are effected comes under this part of our subject. Drop-drills, generally speaking, act by catching the continuous stream of seed, or whatever it be, flowing down the funnel, at the bottom of it, in a revolving pinion, or hollow cylinder with cells of sufficient size, and, by a slow revolution of this, cause each separate cellful to be delivered in a lot as soon as it comes opposite the exit hole.

It is proper here to mention the principle of Mr. Garrett's drop-drill, which, though drop-drills are not much in fashion—and it is not desirable that they should be so—is probably as worthy of adoption, and has obtained as general favour, as any other of the kind. The principle is simply this:—The material sown is delivered down a jointed tube, and the lowest joint has a pendulum or oscillating position given it over a suspended platform, which closes it altogether when at rest. The material caught upon that platform, inside the tube, accumulates there, of course, only so long as the tube is at rest; for, as soon as it moves towards the other end of the arc in which it vibrates, all the contents carried with it are dropped bodily upon the ground. It will easily be seen how this oscillating movement has the effect of breaking the continuity of the line at which the manure and seed would otherwise be delivered, so that in place of such uniform delivery, the whole is broken up into detached portions, placed at intervals upon the ground.

In the whole class of dibbling machines, the seed is not merely laid at intervals in a continuous channel, but it is deposited at intervals in cup-shaped cavities on the surface of the land. The mode of their action will be best described when discussing the merits of the different machines. *J. C. M., in No. 25 of Blackie's Cyclopedia of Agriculture.*

Home Correspondence.

Meteorology.—My proposition regarding the "storm's eye," or "calm in the centre" of rotatory and progressive storms is a very simple one. A calm in such circumstances could not exist. If any portion of the air actually ceased to revolve round a centre, still it must have motion. The storm surely takes its "eye" along with it, or it would fall into the rear and throw the whole into confusion. If the rate of progression of a storm is 40 miles an hour, its "eye" will be dragged along at that rate, and produce a strong current of wind over the line of its tract. It appears to me this is a self-evident proposition. I may also be allowed to point out that my friend "F. P. B. M." is slightly deserting the views of Mr. Redfield and Sir Wm. Reid. He maintains that the atmospheric fluid has an "upward" instead of a downward tendency in the centre of storms; they both, on the other side, maintain that the effect of rotation is to lower the upper atmosphere in the centre, and actually to bring down portions of air from the colder regions. I do assure him that it is no matter of assumption that the winds, which are regarded as rotating round a centre, are often confined to a very limited depth of the atmosphere. Only let "F. P. B. M." observe the next S.E. wind with a falling barometer, and he will no doubt corroborate the remarks which I made on this subject. *R.*

The judicious Management of Labourers' Friend Societies is a subject of great importance, and it is to be hoped that its discussion will be continued in your columns, in consequence of the impulse given to the enquiry, by Mr. Morton's paper, at the Farmers' Club. I would call the attention of your readers to a cognate subject; namely that of Friendly Societies or Benefit Clubs for Labourers. These institutions are supported, in a great measure, by the contributions of the labourers themselves, and it is the more desirable, on this account, that they should be managed with economy and judgment. Unhappily, the reverse is, more frequently, the case. The meetings of these societies are often held at public-houses; the members are subject to fines for non-attendance at periodical meetings, and compelled, by the rules, to spend a certain sum in refreshments if they attend. Assuming the compulsory sum not to be exceeded (I need hardly point out how little probability there is of this at a public-house), I find that it amounts, in many cases, to one-third of the total amount of the receipts, and, consequently, to more than that proportion of the expenditure. In other words, the members of these clubs who are in health are bound to spend in refreshments about one half as much as they distribute in relief to those who are afflicted, and probably do expend quite as much as they distribute. I will not pursue the subject farther, as any one acquainted with the habits of agricultural labourers, and of the unskilled workmen in towns, will readily conclude how much greater than the direct expense the incidental loss to these poor men must be. No doubt there are many exceptions to this state of things—I should be glad to find it the exception—but I fear it is the rule. My object in drawing attention to it is, that it may be corrected by the aid of those who take an interest in the welfare of the labourers, and more especially of those who are asked to contribute to such societies as honorary members. *B. Samuelson.*

Societies.

ROYAL AGRICULTURAL SOCIETY.

Weekly Council.—Mr. Raymond Barker, V.P., in the chair.—The names of 14 candidates for election, received during the previous week, were read. Prof. Schilthuis, of Groningen, presented to the Council a copy of his essay "On the Relations of Agriculture to the Soil and Population, and on the Condition and Improvement of the Agricultural Classes in the Netherlands;" to which the Gold Medal of the Dutch Society of Sciences at Haarlem had been awarded, and which the author offered to the Council on this occasion "as a token of his homage to the merits of England in agricultural science, and as a proof of his esteem for the Royal Agricultural Society, also much valued in his own country." The Council received this present with a vote of their best thanks.—Mr. Miles, M.P., having expressed his own views, and those of Mr. Pusey, on the importance of an early settlement of the prizes to be offered by the Society for the Essays and Reports of next year, it was arranged that a special council should be summoned for that purpose.

Peat-Charcoal.—Prof. Way then proceeded to deliver a lecture on peat-charcoal and other deodorising substances. He remarked that, independently of the noxious gases resulting from the putrefaction of animal matter generally, and which consisted principally of sulphuretted hydrogen and sulphuret of ammonia, each particular animal substance, excretionary or otherwise, had its *peculiar* odour, which, although abundantly perceptible by the senses, and, in many cases, as in musk, almost inexhaustible, was inappreciable in weight; therefore, by deodorising a large amount of odour, it was not to be inferred that a large amount of manuring matter was thereby secured. He then enumerated the various single and double deodorisers that had been employed. He referred to Sir William Burnett's excellent application of chloride of zinc, and to the ordinary chloride of lime; to gypsum (sulphate of lime), and its conversion in ammoniacal atmospheres into sulphate of ammonia and carbonate of lime; to the agreeable odour of pure ammonia, and its power of giving intensity to odours of a disagreeable character, which intensity was lost when the ammonia was withdrawn; to sulphate of iron (green copperas), which when powdered and thrown into tanks turned black, on account of the sulphuret of iron formed on the decomposition of the sulphuretted hydrogen present. He then proceeded to the consideration of charcoal as a deodoriser. He gave an interesting statement of the peculiar action of charcoals in general, arising, he believed, from the great amount of surface their spherical interstices presented, and of the particular action and superior value of animal charcoal over all others. He referred to the theory he had been led to form of this peculiar difference, and to a very successful imitation of animal charcoal, which he and Mr. Paine had made, in reference both to deodorising and decolorising properties, from the light porous silica-rock, found on Mr. Paine's estate in Surrey, which when broken up and steeped in heated tar, was put into a gas-retort, where the tar was burnt off in the state of very pure gas, and a residuum left of the new silicated charcoal in question. He explained that in charcoals it was not the amount of carbon they contained that constituted their value, but the mode in which the carbon was distributed; that animal charcoal contained only 10 per cent. of real carbon, while wood charcoal contained 90 per cent. He referred to the large amount of water, 50 or 60 per cent., which peat charcoal took up, and to the fallacious dry state of the manures with which this water-carrier was mixed. He feared this mode of introducing water in a latent state into manures in many cases gave a turn of the scale more in favour of the manufacturer than of the farmer. He doubted whether peat charcoal could be used economically for the purpose of soaking up tank water; if not, he feared it would prove of no advantage in other respects as a remunerative agent to the farmer. It had been long before the public, but had not progressed in market value, as it would have done had its application been successful. He considered it to lead to much error in practice, that the exact nature of the action of charcoal on ammonia was not better understood by the public. Fresh-burnt charcoal would absorb a large quantity of ammoniacal gas, but it was a mistake to suppose that it would consequently abstract ammonia from a liquid impregnated with it; on the contrary, water had the power of displacing from charcoal the whole of the ammonia it had received in a gaseous state within its pores. Peat charcoal did not either make manure or separate it from sewage; it simply rendered manure portable. He exhibited a striking experiment, showing the power of *dry* peat charcoal to arrest odours. Two open tumblers were half-filled with the most offensive sewage-matter Professor Way could obtain, and the surface of each mass covered with a film of thin paper, and a thin bed of powdered peat charcoal resting upon it. These tumblers were in this state handed round to the members, who ascertained the perfect manner in which the sewage-matter was thus rendered no longer offensive to the smell. He then gave an interesting account of the process of Mr. Stothert, by which sewage-matter was reduced, by a double action of purification, into clear water and inodorous precipitate—a process admirably adapted for sanitary purposes, although not for those of agriculture, as the more valuable manuring matters were held in solution and carried off in the pellucid liquid, while the precipitate was comparatively an inert mass. Remarks, bearing on the questions then brought before the meeting, were then offered by Mr. Paine, Dr. Calvert, Sir John Johnstone, Major Wollaston, Mr. Caird, and the Rev. L. Vernon Harcourt; and the thanks of the members were unanimously offered to Prof. Way, on the motion of Mr. Miles, M.P., seconded by Mr. Parkins.

Messrs. Stassen and Pernollet had leave to exhibit the operation of their apparatus for sorting grain and removing from it all extraneous matters. This operation was effected by passing the grain through a revolving metallic plate cylinder divided into compartments having apertures of different size and shape, the grain (freed from its extraneous accompaniments of small seeds, dirt or stones) passing out at the end of the machine in a state fit for sowing.

The Council adjourned to Wednesday, the 21st of June, at 12 o'clock, when Prof. Way would deliver his Lecture on the Absorbent Nature of Soils.

Flax Society, Belfast.—At the last monthly meeting of the committee it was considered very important, owing to the derangement caused by the war in the supply of Russian Flax, that an early estimate should be formed of the quantity sown in Ireland. A rough calculation had been made, by which it was estimated that the breadth, this year, was about 145,000 statute acres, against 175,000 last year; but as the other data were insufficient, it was thought very desirable that Government should supply a return earlier than the usual period of publishing the yearly statistics. The meeting proceeded to discuss a subject of much importance, arising out of the uncertainty of the duration of the Russian war—viz., the means of obtaining a supply of Flax-seed for next year's crop in Ireland. Should the war continue until the close of the Baltic navigation, the usual supply from Riga would be entirely wanting, or only in part available through Prussian ports; and it was evident that the only other sources of foreign supply would be materially contracted, owing to the necessity of Holland, Belgium, France, and Germany, retaining the seed for their own sowing which they might otherwise export. It was, therefore, of the utmost consequence to the Irish farmer, and to the whole Irish linen trade, that more certain means should be devised for meeting the probable deficiency. The committee were unanimously of opinion that the simplest and most practicable way would be, for every Irish farmer to save a portion of his present crop, by ripening the seed on the straw, and reserving it for sowing next spring; and it was arranged that the most energetic means should be taken, at the pulling season, to bring this advice before the farmers in all the Flax-growing districts of Ireland.

Bath and West of England.—Last week this Society held its third annual meeting at Bath. The report of its proceedings was pressed out of our columns by the length of the report of the London Farmers' Club. It was a most successful gathering—the implement department of the show especially was the best which that Society has hitherto gathered. The following is the list of prizes awarded under this head:—

Plough for deep ploughing, 3*l.*; Eddy, Exeter. Plough for general purposes, 3*l.*; Howard, Bedford. Paring plough, two horses, 2*l.*; Silcock, Chippenham. Subsoil plough, three horses, 3*l.*; Carson, Warminster. Turnwrest plough, 2*l.*; Eddy, Exeter. Heavy harrow, 3*l.*; Cambridge, Bristol, and Howards, Bedford. Light harrow, 2*l.*; Cambridge, Bristol. Best cultivator (wide), 2*l.*; Hart, Wantage. Ditto (narrow), two horses, 2*l.*; Coleman, Chelmsford. Roller, 2*l.*; Wightman and Denning, Chard. Clod-crusher, 2*l.*; Fowler and Fry, Bristol. Corn drill, 5*l.*, Hornsby and Son, Spittlegate; 2*l.*, Fowler and Fry, Bristol. Turnip and Manure drill, 5*l.*, Hornsby and Son; 2*l.*, Holmes and Son, Norwich. Economical small-occupation seed and manure drill, for flat or ridge work, 5*l.*, Bowhay, Modbury, Devon; 2*l.*, Holmes, Norwich. Horse hoe for green crops on the ridge, 2*l.*; Busby, Newton, Bedale. Ditto on the flat, 2*l.*; Busby. Machine for setting out Turnips on the ridge or flat preparatory to singling, 5*l.*; Hackvale, Chipping Norton. Haymaking machine, 2*l.*, Smith and Ashby, Lincoln; 1*l.*, Wightman and Denning. Horse rake for hay or corn, 2*l.*; Howards, Bedford. Portable steam-engine, 4-horse power, 10*l.*; Hornsby and Son, Spittlegate. Portable threshing machine, with straw shaker, to be driven by steam, 4-horse power, 5*l.*; Humphries, Pershore. Portable threshing machine, with straw shaker, four horses, 5*l.*; Webber, Newton Abbott. Straw shaker, 1*l.*; Brinsmead, St. Giles, near Torrington, Devon.

Portable threshing machine, not requiring more than two horses, 5*l.*; Cambridge, Bristol. Clover seed drawer or sheller, 2*l.*; Holmes, Norwich. One-horse cart, for general purposes, 3*l.*; Busby, Newton Bedale. Two-horse waggon, 3*l.*; Milverton, Thorverton, near Collumpton. Rick stand, 2*l.*; Cambridge, Bristol. Chaff cutter, horse or steam power, 5*l.*; Barrett and Co., Reading. Chaff cutter, worked by hand, 2*l.*; Cornes, Nantwich. Turnip cutter for sheep, 2*l.*; Marychurch and Son, Haverfordwest. Corn and pulse bruiser, 2*l.*; Turner and Co., Ipswich—1*l.* to Barrett and Co., Reading. Oilcake crusher, 2*l.*; Hornsby and Son, Spittlegate. Churn, 1*l.*; Burgess and Key, London, Anthony's American churn. Cheese press, 1*l.*; Wightman and Denning, Chard. Draining tools, 2*l.*; Burgess and Key, London.

Special Awards.—S. Rowsell, Buckland St. Mary, 20*s.*, for an American horse rake. W. Pearce, Queen Street, London, 40*s.*, for a vertical Turnip cutter and root slicer. J. Bailey, Nynehead, Wellington, Somerset, 20*s.*, for a Turnip cart and cutter.

It will be seen from this list, and still more was it apparent on the ground, that the Society attracts exhibitors from all parts of the kingdom. Yorkshire, Lincolnshire, Bedfordshire, Essex, Suffolk, were represented in the show yard of the West of England Society, which aims at the improvement of its own district, much more wisely by thus opening its lists to all than if it exclusively patronised and encouraged its own local manufacturers.

In the cattle yard the following prizes were awarded :—

Devons.—Bull, between two and four years old, 12*l.*, Mr. G. Turner, Barton; 5*l.*, Mr. T. Miller, Sherbourne. Bull, under two years old, 12*l.*, Mr. G. Turner; 5*l.*, Mr. J. Quartly, of Molland. Bull, under 12 months old, 5*l.*, Mr. J. Quartly; 3*l.*, Mr. J. T. Davy, of Rose Ash, near South Molton. Best cow in calf, or in milk, 8*l.*, Mr. G. Turner; 4*l.*, Mr. S. Farthing, Stowey Court, Bridgewater. Best heifer, in milk or in calf, 8*l.*, Mr. J. Quartly; 4*l.*, Mr. G. Turner. Best pair of heifers, 5*l.*, Mr. James Hole, of Knowle House, Dunster; 3*l.*, Mr. William Hole, of Hannaford, near Barnstaple.

Short-horns.—Best bull between two and four years old, 12*l.*, Mr. William Fowle, Market Lavington; 5*l.*, Mr. C. H. Abbott, of Long Ashton, near Bristol. Best bull, under two years old, 12*l.*, Mr. R. Stratton, of Swindon; 5*l.*, Mr. W. Hewer, of Sevenhampton. Best bull, under twelve months old, 5*l.*, Mr. R. Stratton; 3*l.*, W. Miles, Esq., M.P., of Leigh Court. Best cow in calf, or in milk, 8*l.*, and 4*l.*, Mr. R. Stratton. Best heifer, in milk or in calf, 8*l.*, and 4*l.*, Mr. R. Stratton. Best pair of heifers, under twelve months old, 5*l.*, Mr. R. Stratton; 3*l.*, Mr. G. Sainsbury, of Corsham.

Hereford, or Cattle of any other Pure Breed.—Best bull, between two and four years old, 12*l.*, Mr. John Feaver, of Wellow; 5*l.*, Mr. W. Melsom, Warminster. Best bull, under two years old, 12*l.*, Mr. Thomas Little, Chippenham. Best cow in calf, or in milk, 8*l.*, Mr. F. Craddock, of Lyppeat, near Radstock.

SHEEP.

Long Woolled (not qualified to compete as Leicester or Cotswold).—Best yearling ram, 5*l.* and 3*l.*, Mr. Thomas Kingdon, Brampford Speke. Best ram under three years old, 5*l.*, Mr. John Radmore, of Thorverton; and 3*l.*, Mr. Thomas Potter, of ditto. Best pen of five ewes, 5*l.*, Mr. Thomas Potter. Best pen of five two-teeth ewes, 5*l.*, James Wentworth Buller, Esq., Crediton.

Leicester and Cotswold.—Best yearling ram of the Leicestershire breed, 5*l.*, James Wentworth Buller, Esq.; 3*l.*, Mr. Thomas Potter. Best yearling ram of the Cotswold breed, 5*l.*, Mr. Edmund Ruck, Crickdale; 3*l.*, Lord de Mauley, Fairford.

Southdowns.—Best yearling ram, 5*l.*, his Grace the Duke of Beaufort; 3*l.*, Mr. John Moore, of Littlecot Farm, Pewsey. Best ram under three years old, 5*l.*, Mr. John Moore; 3*l.*, his Grace the Duke of Beaufort. Best pen of five ewes, 5*l.*, his Grace the Duke of Beaufort; 3*l.*, R. K. M. King, Esq., Taunton. Best pen of five two-teeth ewes, 5*l.*, his Grace the Duke of Beaufort.

Dorsets.—Best yearling ram, 5*l.*, Mr. Thomas Danger, of Hunstile, near Bridgewater; 3*l.*, Mr. George Coombe, of Creech St. Michael, near Taunton. Best ram, not under three years old, 5*l.*, Mr. Thomas Danger; 3*l.*, Mr. George Coombe. Best pen of five ewes, 5*l.*, Mr. George Coombe; 3*l.*, Mr. Thomas Danger. Best pen of five two-teeth ewes, 5*l.*; Mr. George Coombe; 3*l.*, Mr. Thomas Danger.

Mountain Sheep.—Best ram, under three years old, 4*l.*, and 2*l.*, Mr. Nurcombe, Hopcott, Minehead. Best pen of five ewes, of any age, 4*l.*, and 2*l.*, Mr. James Quartly.

PIGS.

Large Breed.—Best boar, not exceeding two years old, 4*l.*, Mr. William Hewer; 2*l.*, the Rev. C. T. James, of Ermington, near Ivybridge. Best breeding sow, 4*l.*, the Rev. C. T. James; 2*l.*, Mr. W. J. Sadler, of Bentham Purton, near Swindon. Best pen of three breeding sows, 2*l.*, and 1*l.*, Mr. Wm. Hewer.

Small Breed.—Best boar, under two years old, 4*l.*, Mr. John Partridge, of Nymett Rowland, near Crediton; 2*l.*, Mr. William Northey, of Lake Farm, Lifton. For the best breeding sow, 4*l.*, and 2*l.*, Mr. William Northey. Best three breeding sows under eight months old, 2*l.*, and 1*l.*, his Grace the Duke of Beaufort.

HORSES.

Best stallion, for agricultural purposes, 15*l.*, Mr. E. Jefferys, of Hill Deverill, near Warminster; 5*l.*, Mr. W. Melson, of Norton Bavant, near Warminster. Best mare in foal, or with a foal by her side, 10*l.*, Mr. H. Bailey, of Woollaston Farm, Berkeley; 5*l.*, Mr. W. Fowle, of Market Lavington, near Devizes. Best two years old colt or filly, for agricultural purposes, 10*l.*, Mr. Robert Hart, of Mark, near Bridgewater. Best thorough-bred stallion, suited for country purposes, 15*l.*, H. D. Seymour, Esq., M.P.

As to the general character of both divisions of the show, we cannot do better than take it from the speeches of those present at the meeting on Thursday —Mr. Miles, M.P., the President, and one of the judges, Mr. Whittaker. Mr. Miles said :—

I have now to say a few words on the animals which were shown, and I am very anxious to do this, because, though I may pass by many classes, still I shall have something to say on one, namely, the sheep. I hope I may be addressing disappointed competitors in this department, because it has been thought necessary that certain rules should be adopted, and that the shearing, not the clipping, should take place at a certain time. Now, the judges thought it their duty, from their determination to carry out the rules of the Society, to exclude many lots of sheep worthy of commendation, and probably worthy of premiums, because they were clipped, and not shorn. I merely mention this to show you that those whom you appointed endeavoured to do their duty. As to the implements, I am indeed proud to say that, however good we may have conceived the exhibition to have been at Taunton—however good we may have conceived the exhibition to have been at Plymouth—this exhibition in Bath exceeds them both; for I find that the number of implements shown at Taunton was 446, at Plymouth 464, those which you have inspected this day are in number no less than 749, showing that the efforts of the Society are appreciated by the implement makers, and that much may be hoped from the trials which have been conducted under the auspices of a gentleman to whom we cannot be too much obliged, Mr. Amos. (Cheers.) I am informed that in the trial of two rival steam-engines, of ten hours' duration, it was found that their merits were so equal that one consumed only two pounds of fuel more than the other, and that the excellence of working was so similar that the only mode which Mr. Amos could adopt for testing their excellence was by taking them to pieces, and awarding the premium to the best made engine (Cheers.) This showed that implements sold with the stamp and authority of being good; and you cannot do better than purchase such when thus assured of their excellence. In conclusion, I am happy to say that through the incessant applications and persevering energy of my friend, Mr. Acland (loud cheers)—and it is right, indeed, that praise should be given where praise is due—we see results in 1854 which we had no reason to anticipate in 1852.

Mr. Whittaker referred to the sheep exhibited. He said :—

That their task as judges had been in some respects a painful one, inasmuch as they had been obliged to disqualify so many of the Down ewes for not being closely shorn, according to the rules of the Society; but that in doing this, they felt they had only done their duty; that they had much pleasure in saying that the whole of the class of horned sheep presented a marked contrast, in being most fairly and closely shorn; that they begged leave to suggest to the society the propriety of removing the restriction as to the time of shearing; that in their opinion the certificates given by exhibitors should contain as few restrictions as possible, as, however stringent they are, the unscrupulous will disregard them, and thus place judges in the painful dilemma of either shrinking from their duty, or impugning the integrity of exhibitors. They consider, therefore, that the question as to the time of shearing should be left to the discrimination of the judges; that the judges also recommend the removal of the restriction as to the age at which rams are shorn, as in restricting them to three years many superior sheep are excluded from competition; besides that, it is open to the objections before stated. They also recommend the Society to extend their premiums to the Cotswold and Leicester classes, to ewes of the two ages, and to old rams, giving the same premiums in these classes as are given for long-woolled sheep, Down, and horned sheep classes. They noticed some very superior rams and ewes, belonging to Lord de Mauley, excluded from competition, and placed as extra stock in consequence of their being shown as Cotswolds, and thus excluded from the long-woolled class.

Mr. Acland, to whom the Society in its present form owes its existence, with great tact referred, in the course of one of the addresses of the evening, to the idea which prevailed in some quarters, that this Society was intended as a rival to the Royal Agricultural Society; and showed that, omitting Middlesex and Yorkshire, there was only one other county in England which had more members of the Royal Agricultural Society than the two counties of Devon and Somerset, and that county was Norfolk—the number of members being, in Middlesex 266, Yorkshire 229, Norfolk 256, Devon 208, and Somerset 187.

The Poultry Show will be found noticed below.

Poultry.

BATH.—The show of poultry in connection with the Bath and West of England Society's show of stock, which took place on the 7th, 8th, and 9th inst., was a very attractive one, and, we believe, gave general satisfaction, as is proved by the fact, that, notwithstanding the insinuating appeals of the fair vendors at the "Fancy Fair" which was held adjoining the poultry show, on the one side, and the capital show of stock on the other, many worthy representatives of John Bull were to be continually encountered in the thronged space between the rows of poultry. The pens were arranged in tents; and unless our amateur could summon sufficient resolution to visit the show early in the morning, as soon as the doors were open to the public, he must have found it utterly impracticable to examine into the merits of the respective coops, and rested contented with a "bird's-eye" glimpse; for, the fashionable world once stirring, to do otherwise than go with the stream was impossible. By far the greater attention was given to what we consider the agricultural class, the Dorkings; and never before have we seen them so fully and justly appreciated. Go where you would their tent was always crowded; every pen of chickens ticketed at anything approaching a reasonable price was immediately claimed. The only way to avoid the crush was by visiting that part allotted to the Cochins; but as everything will find its level, and it is not our wish to assist in drowning a sinking man, for Cochins certainly have some redeeming points, we will merely state that they attracted but little notice, although there were several pens of very superior birds among them. Their reign is over. 404 pens of fowls were exhibited, 27 pens of ducks, 4 of geese, and 8 pens of turkeys; there were also 67 pairs of pigeons. Hon. Director, Jonathan Grey, Esq.; Hon. Secretary, Henry Spackman, Esq.; and to these gentlemen the public are deeply indebted for the care bestowed on the birds, and the attention given to the gratification of the visitors. The judges were Messrs. Andrews, Symonds, and Hewitt; their awards gave great satisfaction, and, from the excellence of many of the pens, and their near approach to each other in merit, the task could not have been a light one. We will now mention a few of the principal pens in the various classes, and will then subjoin the prize list, in which our readers will recognise many well known names. In Class I. (Spanish) there were 22 entries, and a remarkably good and well matched class it was. In Class II. only three entries, and therefore we cannot wonder that Mr. Plummer easily walked over the course. Mrs. George carried off the first prize for mature Dorkings, and Mr. Davies (to whom the greater portion of our readers are doubtless aware the much dreaded Captain Hornby, for so long a time the cock of the walk, has assigned his whole stock) took the second. The birds belonging to Messrs. Pope and Blandford were very superior. The first prize birds were ticketed at 30*l.*, and were, moreover, claimed at that price; *policy* might have lent a hand in effecting the sale, as we understand they were entered for Lincoln, and it seems probable that the first and second prize birds will take the same position there that they have now taken at Bath. In the white Dorking class improvement was obvious, as also in the Malay class, where, of course, Mr. Manfield's name was conspicuous. In the Hamburgh classes the name of Fookes again appears; before these classes are entirely to our liking, the "hen-feathered" birds in the spangled varieties must be put out of the way. The Polands were not anything very remarkable. In the "Game" class there were many excellent pens, although it was not so even a class as many others. The Bantams, Geese, Turkeys, and Aylesbury Ducks were exceedingly good, and the show of "Pigeons" was a pleasing addition.

CLASS I. SPANISH.—1st, Mr. H. D. Davies, Spring Grove House, Hounslow; 2d, Mr. J. G. Rake, Bristol; 3d, Mr. Plummer, Brislington, Bristol.

II. SPANISH CHICKENS.—1st, Mr. Plummer; 2d, do.

III. DORKING: *coloured.*—1st, Mrs. George, Rookery, Croydon; 2d, Mr. Davies; 3d, Mr. Breavington, Vicarage Farm, Hounslow.

IV. DORKING CHICKENS: *coloured.*—1st, Miss Perkins, Sutton Coldfield, Birmingham; 2d, Mr. Davies.

V. DORKING: *white.*—1st, Mr. C. Edwards, Brislington; 2d, Mr. J. Clift, Dorking; 3d, Mr. J. Jennens, Moseley, Birmingham.

VI. DORKING CHICKENS: *white.*—1st, Mr. G. Vivian, Claverton Manor, Bath; 2d, Mrs. J. Longman, Lyde Farm, Yeovil.

VII. COCHIN CHINA: *buff or cinnamon.*—1st, Mr. C. Clark, Glastonbury; 2d, Mr. Fairley, Chevely Park; 3d, Mr. J. Crane, jun., Tolpuddle, Dorset.

VIII. COCHIN CHINA CHICKENS: *buff or cinnamon.*—1st, Mr. J. R. Rodbard, Wrington; 2d, Mr. J. Dorrell, Slough, Bucks.

IX. COCHIN CHINA: *brown, partridge, or grouse.*—1st, Rev. G. F. Hodson, Banwell; 2d, Mr. Fairlie; 3d, Mr. J. F. Chater, Haverhill, Suffolk.

X. COCHIN CHINA CHICKENS: *brown, partridge, or grouse.*—1st, Mr. J. Garrod, Cheveley; 2d, Capt. W. H. Snell, St. Swithin's Lane, London.

XI. COCHIN CHINA: *white.*—1st, Mr. Cyrus Clark; 2d, Mrs. S. R. Herbert, Powick; 3d, Rev. G. Hutchinson, Malmesbury.

XII. COCHIN CHINA CHICKENS: *white.*—1st, Mr. Turner, Northbrook, Exeter; 2d, Mr. Buckley, Llanelly, Carmarthenshire.

XIII. COCHIN CHINA: *black.*—1st, Mr. Fairlie; 2d, Rev. G. H. H. Hutchinson.

XIV. BRAMAH POOTRA.—1st, Mr. Fairlie; 2d, ditto.

XV. GAME: *white and piles.*—1st, Rev. T. L. Fellowes, Aile, Norfolk; 2d, Mr. J. R. Rodbard, Wrington.

XVI. GAME: *black breasted and other reds.*—1st, Mr. John R. Rodbard; 2d, Mr. Charles Edwards.

XVII. GAME: *duckwings and other greys and blues.*—1st, Rev. C. T. James, Ivybridge; 2d, Mr. W. Manfield, Dorchester.

XVIII. GAME: *black and brassy-winged, except greys.*—1st, Mr. H. Shield, Taunton; 2d, Mr. N. N. Dyer, Bredon, near Tewkesbury.

XIX. MALAY.—1st, Mr. W. Manfield, Dorchester; 2d, Mr. J. Oldham, Long Eaton.

XX. HAMBURGH: *golden pencilled.*—1st, Mr. Robert Fookes, Blandford, Dorset; 2d, do.

XXI. HAMBURGH: *silver-pencilled.*—1st, Mr. Thomas M'Cann, Malvern; 2d, Mr. Cyrus Clark.

XXII HAMBURGH: *golden-spangled.*—1st, Mrs. H. Fookes; 2d, Mr. C. Edwards.

XXIII. HAMBURGH: *silver-spangled.*—1st, Mr. Joseph Symonds, Gorwell, Dorchester; 2d, Dr. Rogers, Honiton.

XXIV. BLACK POLAND WITH WHITE CRESTS.—1st, Mr. A. Williams, Reading; 2d, Mr. C. Edwards.

XXV. POLANDS: *golden-spangled.*—1st, Mr. R. H. Bush, Ashton Lodge, Bath; 2d, Mr. C. Clark.

XXVI. POLANDS: *silver-spangled.*—1st, Mr. C. Clark; 2d, Mr. C. Edwards.

Vitality of Eggs.—I certainly have seen, but I cannot now recollect where, the following suggestion for preserving eggs without destroying the vital principle contained in them, so that they could be hatched after a long period and after travelling a considerable distance, say from America. The plan suggested was that they should be coated with a gum soluble in water, which, while on them, would effectually exclude the air, but which could be completely washed off for the purpose of hatching them. *J. E. H.*

Calendar of Operations.

JUNE.

BERWICKSHIRE MERSE FARM, *June* 13.—Turnip sowing is now all but completed, and the first sowings of Swedes and Yellows look very well indeed, a considerable extent being in the rough leaf, thanks to the rain in the end of last month. Throughout the season we have easily obtained a fine mould, such as the young plant loves; and the clay lands have not been known to work so well for years. Wheat continues healthy, and, with the exception of late spring breaks, is forward. Barley and Oats, the latter especially, were much retarded by long drought; and, even since the rain came, have made but little progress, owing to the unseasonably cold weather accompanying it. During the past week, however, it has become much milder, and, with a return of kindly showers, we may yet hope that the Oat fields will assume a more regular aspect where at present but too much "red land" is visible. Beans and Peas are strong, and some preparing to bloom. Pastures, from being so early stocked, have in many places been for a long time very bare. Young Grass fields I have seen without a green blade, to the certain injury of the plants. Now, however, they are rapidly improving; and this, in conjunction with good prospects for the Turnip crop and the present price of fat, has raised the price of lean stock to an extravagant pitch. Stackyards contain next to nothing; and the local demand keeps our district corn markets above the rates current in the metropolis. Sheep shearing is mostly over, except some flocks of ewes; and the wool is very fair, both as to quantity and quality. Lambs are a small crop, and will be much sought after at weaning time. *J. T.*

BORDER OF THE FENS, *June* 13.—Turnip sowing is now the most important object in hand. Everywhere great efforts have been made this season to clear the land thoroughly from Twitch and root-weeds; granted, then, that a clean tilth has been prepared, the quantity and quality of the manures are the next subjects of consideration. 1st. How has the manure been made—under sheds or in open yards? If under sheds, it will most probably be well trodden and saturated with urine, and, after undergoing a slight fermentation, be of great value; but the quantity will, under the ordinary circumstances which prevail in farmsteadings, be found lamentably deficient; and, indeed, to provide sheds for wintering all the live stock under cover would demand an immense outlay, much of which, after all, might be unnecessary. Sheds, with yards attached, are found to answer all purposes for store stock, and even for forward beasts; they are calculated to make a great bulk of good manure, if the food be generous; nor is the access of moisture, in my opinion, so objectionable as is by some correspondents of the *Agri. Gazette* made to appear—witness the incompleteness of the manure made this year, owing to the long-continued drought of the past spring. We are of opinion that all the straw, or the greater part of it, produced on a farm should be converted into manure, and returned to the land. This is not a very novel or startling idea, and yet it seems strange that contrivances should be in request to divert straw to other purposes, and substitute weeds, ditch scrapings, and rubbish of all kinds, to make up a tolerably-sized heap of so-called manure. Neither will the expensive and oft-repaired apparatus of Mr. Mechi fulfil the conditions supplied by well-made manure. Liquid manure forms an excellent stimulus; but we may be permitted to doubt (where the shape of the farm, or the abundance of water or other facilities are available) whether any mixture can be,

applied sufficiently strong and plentiful, economically to sustain the growing produce of a farm; though prepared at the same time to admit the usefulness of such an addition to other fertilising agents available for the attainment of high and remunerative cultivation. Dovecotes, poultry-houses, calf-sheds, pigsties, lambing-yards, and every other corner where ammonia or phosphates may be suspected to lurk, have been all pressed into the service; and, lastly, we have employed a fair quantum of artificials, among which our treatment of "bones and acid" alone seems to call for notice. We have a "widish" sort of an oil-pipe into which we put 8 or 10 bushels of bone-dust, over which is poured sufficient water to be seen standing an inch or two inches below the top of the bones; to this we add about 2 gallons of strong sulphuric acid (from 36 lbs. to 40 lbs.), and stir it with a long staff for half an hour, until it forms a sort of paste; it is then emptied upon a floor of ashes, and so on until the whole quantity is completed. After remaining in a heap for two or three days, guano or any other dry manure may be added, when it is twice turned over, and should be found then well mixed for use. A moderate amount of attention is required throughout to burn the ashes; separate any lumps or tufts and mix the ingredients thoroughly, the result will reward your care by providing some solid and substantial nutriment for the root and subsequent corn crop. The second week in June is here the favourite time for sowing Turnips; if sown before, they are apt to mildew. The first or second week in July for Coleseed, which, of course, should be treated with a large measure of muck, as well as Turnips. Some persons, however, omit acid with Coleseed, on the ground that although it may enable the bones to act speedily upon the first growth of Coleseed, yet that this growth is not prolonged or so successful as when bones alone are applied; this should be ascertained. Fen land, where Coleseed is chiefly grown, is supposed to be much weaker than it used to be, excepting where "clayed;" therefore it is desirable that whenever practicable, whether with green or corn cropping, every opportunity should be seized for carting heavier soils to be spread over the land—even silt is an improvement; clay is generally so, but road-scrapings, where limestone is used, will be found most advantageous. Salt is another cheap material that seems to assist in retaining moisture on the land, always a good indication of fertility; and, lastly, town manure is a capital auxiliary, though heavy of carriage, and often encumbered with useless refuse. Yesterday we were favoured with a heavy rain, which was extremely acceptable for all purposes, the hay crops being thin and backward, the pastures getting very bare, and some of the spring cropping going off for want of moisture. The Wheat is in many places thin, but everywhere looks healthy, and a few straggling ears may be seen emerging from the sheath; Beans are thin; Peas remarkably healthy and forward; Potatoes looking well; Clover will be a good crop, but that last sown was sadly injured by the late frosts. Labourers' wages continue 13*s.* a week; women earn 1*s.* a day, and children in gangs of 30 are paid 12*s.* per score per day, including the gangman, and, with a good man to manage them, they are happy enough, and their work not hard; and to a couple with a large family the addition of 3*s.* or 4*s.* a week to their income, for each boy or girl able to pick up Twitch or weeds, is very acceptable, and serves to keep the pot boiling, the garments whole, and the young ones from mischief. In conclusion, we are ready to bear testimony to the exemplary conduct of the recipients of prizes for skill in draining, ploughing, &c., given by our local society, which conduct we are also willing to attribute, in a great degree, to a previously well-established good understanding between the masters and men; the latter are improving fast, appearing to be awakened to the folly of anticipating their wages at beershops, excepting when they are left altogether to themselves or where a bad example is set by those who ought to know better; then, alas! are produced applicants for relief at every opportunity, a shifting and disorderly cluster of "eye-servants" (late at work and soon home, with pipes in their mouths, while pretending to be busy), dissolute, saucy, ignorant, and discontented—their existence is only recognised by the stain they leave on society; and whether high wages, education, or agricultural societies, are to rescue these loose countrymen of ours from their degradation, we shall welcome any influence that may give them an honest pride to outshine the town and manufacturing population, as well by their intelligence as by their orderly habits and robust bodily vigour. Wheat continues very steady at 81*s.* per qr., of 18 stones per coomb; 11 stone Oats, at 32*s.*; Barley, malting, at 34*s.*; 19 stone Beans, at 52*s.*; Turnip seed, at 1*s.* and 1*s.* 2*d.* per lb.; Wool is declining, at from 26*s.* to 28*s.* per tod. *J. W., Peterborough.* [Thanks.]

West Sussex, *June* 13.—Wheat has looked anything but well, some of it has got very brown, almost as if it was turning off for harvest; but we must not yet be alarmed, as it has appeared to recover during the past few days, and the ear, which is now coming out, looks healthy, but not so large as we were led to expect during its progress in the spring. Here we have had the white Wheat most affected, and I believe that is generally the case; and as it is a practice hereabout to sow white and red mixed (or what is called white and white strawed), perhaps the white being affected gives the fields generally the appearance of being hurt. There are various opinions as to the cause; most attribute it to the frosty nights and cold winds that have prevailed; but this I cannot do, as I have not been able to find it prevail less in situations that were well sheltered from frost and cold. I am inclined to think it is some mysterious blight, resembling that which affects the Potatoes, only that it has shown itself in Wheat before it has appeared in the Potatoes. But it has, I am sorry to say, appeared in them now, with unmistakeable signs, both in haulm and root. I have seen several pieces affected, and some of the Potatoes half rotten. Nettles also show the same symptoms, and, so far as I am aware, before it appeared in the Potatoes. As it has come earlier, I fear there is little chance of the late crops being heavy. Barley and Oats still look healthy; Mangold Wurzel is up, and looking as well as we can expect with the cold weather that has been so ill-suited to its tender nature. We have some sown in a piece of very heavy, mostly clay, land, where if we do succeed in getting a crop, I think we need not fear trying them anywhere; and they look well, except in some spots where they do not like to show up very quickly. Swede sowing is generally begun, and, in some instances, finished; the first sown are up, and look fresh. Turnip sowing will be finished early. Hay-making is begun, and will be a very light affair; but though the hay crop will be light, pasture is very good, and stock do well. *G. S.*

Notices to Correspondents.

Beet-root: *W B Hurnard* says:—I shall feel greatly obliged to any of your correspondents, if they will kindly inform me whether or not their experience leads them to approve of Beet-root as food for pigs, of course with an admixture of more solid food—viz.: Is it good for sows in pig, for sows after pigging, and for young growing pigs during the spring and summer months? As a root, is it considered equally nourishing as the Swede Turnip? [Not during winter and early spring.]

Books: *G J C.* The principles of account keeping are the same for agriculture as for commercial concerns. See article "Accounts" in "Blackie's Cyclopedia." We should prefer adopting the day-book, journal, and ledger system of ordinary book-keeping, to any of the published forms intended to simplify this matter for agriculturists.

Small Farm: *D. Copland.* Of course the whole thing was absurd enough. Our "endorsement" of it, written without much thought, related merely to the possibility of attaining the main results indicated on a rental of 600*l.*, as for instance on a farm of 400 acres. No one could understand from it any sanction of the absurdities involved in the details.

Weazels: *P F.* The common steel trap baited with a small bird or young rabbit will take them. It is said they are attracted to the trap by the bait being scented with musk.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cliveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom, as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The Machine is made to cut the breadths of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

Further particulars, with prices, may be had on application.

BUDDING'S LAWN MOWERS, with Samuelson's registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

BALANCE OF FACTS IN FAVOUR OF

RICHMOND AND CHANDLER, who have, in competition with the best selected CHAFF CUTTERS of the most celebrated makers in the trade, carried off the highest prizes against all comers.

COPY OF TESTIMONIAL.

"Early Court, Reading.

"Gentlemen,—I beg to hand you a cheque for your Corn Crusher; I must add, at the same time, that nothing can exceed the goodness of the Machine. I have found in it all I can wish, and, moreover a very superior finished Machine, and a pattern for other makers. (Signed) "Geo. Shackell.

No. 14	„ 30 „	„	45	„	...	5	18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21s.; Plain Syringes from 10s. 6d. upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

REDUCTION IN PRICE.

No. 11.
No. 14.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists, for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour himself. Syringes are economical only for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

BARTON'S PATENT STABLE FITTINGS AND ENAMELLED MANGERS.—These Fittings have all the newest improvements, and are the only patented invention of this description.

JAMES BARTON, Iron Founder, Smith, &c., 370, Oxford Street, a few doors East of the Pantheon.

MORNING FROSTS.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Removing to 112, Regent Street, London.)

PRIZE MEDAL—1851.

AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON AND BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c Circulars sent on application.

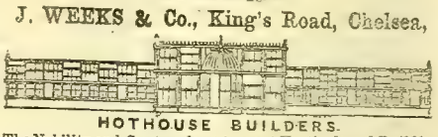
N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER, and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, begs to solicit the attention of the Gentry to his prices for cash. Good substantially built Greenhouses, fixed in any part of the kingdom, 42 feet long, 13 feet wide, 90*l.*; 21 feet by 13 feet, 50*l.*; 12½ feet by 10 feet, 30*l.* A large assortment of Melon and Cucumber boxes, summer houses, &c. Estimates for any branch in the above line either in iron or wood, or park fencing.

HORTICULTURE IN ALL ITS BRANCHES.

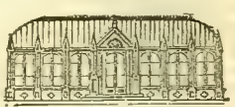
J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.



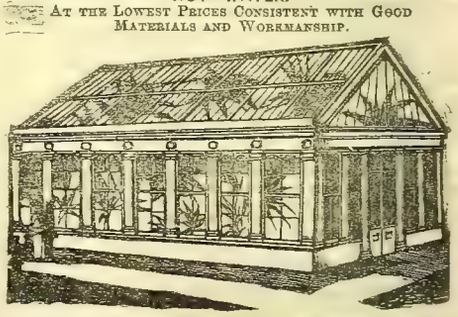
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

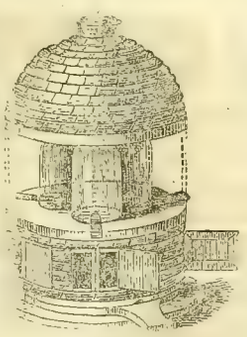
Warehouse, 87, Bishopsgate Street Without—same side as Eastern Counties Railway.

BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.



This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, F. & A. DICKSON & SONS, 106, Eastgate Street; Glasgow, AUSTEN & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

SUMMER HOUSES IN WOOD AND IRON FOR GARDENS, from 50*s.* each, all made portable, so that they can easily be erected by any ordinary labourer. Drawings of 28 sent free. Small Rooms, 6 feet square, price 5*l.*, with doors and windows, and painted.—R. RICHARDSON, 21, Tonbridge Place, New Road, London. N.B. Maker of Iron and Wood Houses for Emigrants; drawings of 21 sent free.

SUBSTANTIAL POULTRY HOUSE, 12 feet by 4, for 4*l.*, consisting of House 4 feet square, and covered Run for Fowls 8 feet by 4. The above is painted, and delivered free within four miles of London. Drawings of several sent free. Large Enclosures for Fowls and Pheasants very cheap.

R. RICHARDSON, 21, Tonbridge Place, New Road, London.

N.B. The above are portable, and can be erected by any ordinary labourer.

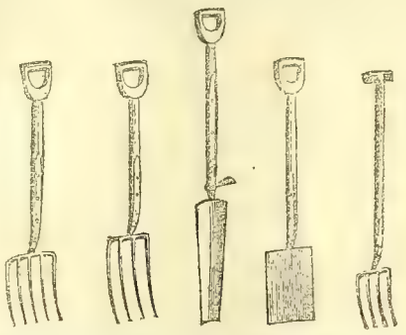
TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have ways in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement J. B. WHITE & BROTHERS, Millbank Street, Westminster.

RIPE FRUIT, STRAWBERRIES, AND SEED BEDS.—New Twined Netting (tanned if required), 1 yard wide, 1½*d.* per yard; 2 yards wide, 3*d.* per yard; 4 yards wide, 6*d.* per yard; ½-inch mesh do., 2 yards wide, 6*d.* per yard. The Elastic Hexagon Garden Netting, 76 meshes to the square inch, effectually excludes birds, wasps, flies, &c, from fruit trees, flower or seed beds, 4½*d.* per square yard. Tanned Netting, 2 or 3 yards wide, 1½*d.* per yard; 4 or 6 yards wide, 3*d.* per yard, exactly the same as advertised by others at double the above prices. Coir or Hemp Sheepfolding Net, of superior quality, 4 ft. high, 4*d.* to 6*d.* per yard. Lamb Net, 6*d.* per yard. Rabbit Net, 1½*d.* per yard, 4 feet wide; each edge Corded, 2*d.* per yard, suitable for fowl fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for fencing against fowls, cats, &c.

The largest, cheapest, and best stock in the world, at W. CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond Road, Kingsland, London; and at the Crystal Palace, South West Gallery, Sydenham. The Trade supplied. Orders by Post punctually attended to. Fishing Nets of all kinds in stock.

MILDEW AND RED SPIDER.

BAINBRIDGE ALKALINE EXTRACT.—We can confidently recommend the above as a sure remedy, having used it successfully for many years both on Vines and Peaches, &c. &c. Pints, 3*s.*; quarts, 5*s.* A quart is sufficient for 20 gallons of water applied with the Syringe.

BAINBRIDGE GUIDE TO THE CONSERVATORY, 5*s.* each. Sold wholesale and retail by R. BALDWIN, Paternoster Row. Gentlemen can procure the above in any part of the country through their Bookseller, in their Monthly parcels.

Sold also by BAINBRIDGE & HEWISON, 7, Bridge Street, York.

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, MOUSTACHES, &c.?—ALICE MELVILLE'S PALMAPILLA in all cases strengthens weak hair, prevents its falling off, checks greyness, produces a thick and luxuriant growth, dispels scurf and dandriff, and makes it clean, soft, curly, and brilliant in appearance. For baldness from any cause it is certain and effective; and for the production of Whiskers, Moustaches, Eyebrows, &c., in three or four weeks, it can be fully depended upon. Price 2*s.* 6*d.*, sent post free (anywhere) on receipt of 30 penny postage stamps, by Miss MELVILLE, 25, Argyle Square, King's Cross, London. —"My whiskers are growing very thick." R. Mede, Esq.—"It restored my hair, which I had lost in patches." W. Sturt.—"It has quite checked the greyness." Miss Ellis.—"My Moustache is greatly improved." Capt. Ross.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.? If so, use Miss GRAHAM'S NIOUKRENE, the most efficacious Hair generant ever introduced. It reproduces the Hair when lost either by disease or decay, prevents its falling off, effectually checks greyness, strengthens weak hair, and is guaranteed to produce those attractive ornaments, Whiskers, Moustachios, Eyebrows, &c., in three or four weeks. For nourishing and beautifying the hair, and sustaining its curling powers in all weathers, it has no equal. Price 2*s.*, and sent post free to any part of the kingdom, on receipt of 24 penny postage stamps, by ELLEN GRAHAM, 3, New Road, Hornsey, Middlesex.—"My hair is quite restored." Miss ORME.—"I have a full pair of Whiskers, thanks to your Nioukrene." H. ROBE, Esq.—"It has checked the greyness." Mrs. JONES.

NEAR FARNHAM, SURREY.

Sales by Auction.

FANCY POULTRY—PERIODICAL SALE.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, June 20, at 12 o'clock precisely, very purely bred COCHINS and BRAMAH FOWLS and CHICKENS, from the renowned yards of Dr. Gwynne, Messrs. Sparham, Gilbert, Johnson, of Farnham, Fisher, &c.; and some Prize Coloured DORKINGS from the Rev. F. Thursby—upwards of 200 lots—many of the birds being very choice, and well deserving the attention of breeders of first class stock.—May be viewed on the morning of sale, and Catalogues had by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

ORCHIDS FROM NEW GRANADA.

MR. J. C. STEVENS begs to announce for Sale by Auction, at his Great Room, 38, King Street, Covent Garden, on FRIDAY next, 23d inst., at 12 for 1 o'clock, an importation (just received per steamer Avon) of Orchids collected in New Granada, and certainly the finest that have yet reached Europe from that district. The plants are in capital condition, and the following very rare species are included: Odontoglossum Pescatorei, Halli, nævium, Schlimi, nebulosum, &c. Uropedium Lindeni in fine masses, Miltonia pulchella, Barkeria elegans, Anguloa macrantha, a beautiful new species, and many other choice varieties.—May be viewed the morning of sale, and, if it is possible, Catalogues will be forwarded as usual.

ORCHIDS.

ESTABLISHED PLANTS OF THE GREATEST RARITY.

IMPORTANT TO AMATEURS.

MR. J. C. STEVENS is directed to Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on THURSDAY, June 22, at 12 for 1 o'clock, Magnificent SPECIMEN PLANTS from a Gentleman's collection, including amongst others the following very great rarities:—Aerides Larpentæ, Schröderi, quinquevulnerum, and maculosum; Vanda suavis (Veitch's true), Saccolabium guttatum splendens, Cymbidium eburneum, Cypripedium Lowi, Odontoglossum nævium, and many choice Phalænopsis, Cattleyas, Anguloas, Dendrobiums, &c. Also, a small importation from the East, containing a distinct new Aerides, and some recently imported plants from Guatemala and Venezuela.—May be viewed on the morning of Sale; and Catalogues, which are preparing, will be forwarded in due course.

WINDING-UP SALE FOR THE SEASON.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew Lane, on FRIDAY, June 23, at 12 o'clock, a first-rate Collection of DAHLIAS, comprising all the newest kinds; choice FUCHSIAS, VERBENAS, PETUNIAS, Climbing and other ROSES, a selected assortment of GERANIUMS, and other Plants in bloom; with a variety of Plants for Bedding.—On view the morning of Sale; Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

DOWN COTSWOLD RAM LAMBS.

MESSRS. GODWIN AND SON are instructed by Mr. J. T. Twynam to offer for Sale by Public Auction, at the Corn Exchange, Winchester, on MONDAY, July 17, at 2 o'clock precisely (the day previous to the Great Overton Hampshire Lamb and Sheep Fair, about Forty prime RAM LAMBS, and Three Four-teeth RAMS, of the above valuable breed, now so rapidly rising in public favour. These Lambs are of great size, of one uniform brown or dark colour of face and legs, and possess the most complete amalgamation of the Down and Cotswold symmetry, fleece, and flesh. The sire is (chiefly) Mr. Druce's (of Ensham, Oxford) No. 7 Down Cotswold Ram, a sheep of beautiful mould and thick flesh; the dams descended from the well-known flock of Down Cotswolds, established by Mr. J. T. Twynam, at Whitchurch, in 1835. Mr. Druce's wethers took the first prize at Smithfield at the last Christmas Exhibition for Crossed Sheep, in class 23. Winchester offers every facility and convenience for gentlemen and dealers who intend visiting the Fair at Overton on the following day.—The Lambs can be seen and particulars obtained on application to J. P. TWYNAM, North Walls, Winchester.

LYELL'S PRINCIPLES OF GEOLOGY.

London: Published at the Office, National Library, Milford House, Strand; and by W. S. ORR & Co., Amen Corner, Paternoster Row.

ON MARRIAGE.

Just published (to be had free, by enclosing 1*s*. or Twelve Postage Stamps, to Mr. WATSON, Clerical Agent, Robert Street, Adelphi, London).

MATRIMONY.—A Pamphlet on Matrimonial Alliances, which merits the attention of those who wish to settle honourably in life. By a Clergyman.

NOTE.—The letters received daily at the Offices from this year's customers fully support the high character this Manure obtained last year. A few are subjoined.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

THE "ECONOMICAL" MANURE,

SO CALLED, BECAUSE

1¼ TO 1½ CWT. PER ACRE, COSTING 15*s*. TO 18*s*., IS AMPLE, AND FULLY EQUAL TO 3 CWT. OF THE BEST PERUVIAN GUANO: THUS SAVING AT LEAST 50 PER CENT., BESIDES CARRIAGE, &c.

THIS quantity is quite sufficient, and must on no account be exceeded, as injury instead of benefit arises if more is used, the Manure having been purposely manufactured in a highly concentrated state.

N.B.—The following dozen Testimonials (more were given in a recent week's Paper), taken from some hundreds contained in the Company's pamphlet, embracing all parts of the United Kingdom and the Continent, show that this is the cheapest and most efficient Manure the farmer can possibly employ; and although they refer only to its use for Turnips and Root Crops, it produced the most wonderful results last year on every kind of crop, and on all soils, far surpassing the expectations of the purchasers. This, no one reading the pamphlet can doubt, as in fair comparative trials with guano, dung, and other long recognised fertilisers, it will be seen the "ECONOMICAL" was superior; that it is most valuable for fruit trees, shrubs, and garden purposes, and produces the most astonishing effects upon manure heaps, applied in solution, decomposing in 15 days all vegetable matter, peat included, and that it is a perfect deodoriser for liquid manure, besides enhancing its fertilising properties.

It is a chemical compound in a highly concentrated state, providing the plants with a large proportion of ammonia, which it has the property of attracting from the atmosphere and fixing in the soil, as well as the carbonic acid—two of the most energetic agents of vegetation. It is sold in a dry powdered state, and is the result of many years' labour of an eminent Foreign Agriculturist, the Director of the Government Schools of Agriculture in his own country, and of high reputation as a chemist. It is patented, and is one of the most useful and greatest discoveries of the day.

Orders received at the Offices of the BRITISH ECONOMICAL MANURE COMPANY, 10, MARK LANE, LONDON, where a pamphlet, containing hundreds of Testimonials from all parts of ENGLAND, SCOTLAND, and WALES, FRANCE, BELGIUM, and SPAIN, with directions for use, samples, and all particulars, may be had, or will be sent gratis on applying to

BENJAMIN COVENEY, *Manager*.

GOOD AGENTS WANTED.—AN ALLOWANCE TO THE TRADE.

Extracts from the Testimonials, the Originals of which can be seen.

1. That at a cost of 12*s*. per acre the Turnips were "a most extraordinary crop."—JOHN HASSELL, Agent to the Right Hon. the Earl of Chesterfield, Shelford Manor, Bingham, Notts. Nov. 8th, 1853.

2. With 1½ cwt. per acre they (the Turnips) "are equally as good as where I applied 3½ cwt. of superphosphate of lime per acre."—R. H. WALPOLE, West Bilney, Swaffham, Norfolk. Oct. 13th, 1853.

3. An expense of 23*s*. per Scotch acre for this manure produced Turnips "equally as good as those growing in the same field with 6 cwt. per Scotch acre of guano, at 12*s*. 6*d*. per cwt.;" making 3 guineas against 23*s*.—WILLIAM MORRISON, Mungalhead, Falkirk, Stirlingshire, N.B. Oct 14th, 1853.

4. "I can see little difference in the two, where 1 cwt. per acre of this Manure was used against 3 cwt. of guano."—JAMES CAERFRAE, Farm Manager to James Stewart, Esq., Cairnsmore, Newton Stewart, Wigtownshire, N.B. Oct. 21st, 1853.

5. 7½ cwt. to 6 acres gave Mr. John Graham, Farmer, Beaumont, near Carlisle, "a splendid crop of Turnips," from the Economical Manure alone, which cost 15*s*. per acre.—THOMAS BLACKLOCK, Carlisle. Dec. 5th, 1853.

6. "I used it against two others, and have a splendid crop of Turnips, beating both the others."—THOMAS CUBITT, Witton, North Walsham, Norfolk. Nov. 1st, 1853.

7. "Where I applied it the Turnips are much finer than usual."—JOHN POLES, Alwalton Lodge, Peterborough, Northamptonshire. Nov. 30th, 1853.

8. "The fly has not taken them (the Turnips) so much as where guano was used."—THOMAS HATFIELD, Albion Foundry, Rugeley, Staffordshire.—July 1st, 1853.

9. On Mangold Wurzel, 1 cwt. per acre produced "the best crop I have ever grown."—WM. C. PEEK, Soham, Cambridgeshire. Oct. 4th, 1853.

10. In 1½ cwt. per acre against 3 cwt. of superphosphate, "the 'Economical' was superior."—GEORGE PYE, Cublington Madley, Hereford. Jan. 2d, 1854.

11. Where guano and the Economical Manure were used, "it is impossible to tell one from the other."—WM. BOWER, Moorgate House, East Retford, Notts.—Feb. 14th, 1854.

12. "My Swedish Turnips are capital—the best people tell me, in the whole parish."—EDWARD MEADE, North Walsham, Norfolk. Oct. 26th, 1853.

TESTIMONIALS FOR 1854.

The Company have the satisfaction to state that they are in receipt of most favourable reports of the effect of the Manure this year—two or three are subjoined. The first is from Mr. William Bennett, who may be considered a practical authority on these matters, and whose opinion must have some weight.

To Mr. COVENEY.—SIR,—You are aware, I think, that I applied some of your Economical Manure to various crops this spring—on two different fields of Wheat, a piece of Barley, 2 acres of Clover, and on some autumn-set Cabbages. All I can say (and as it is the first year of my using the article) all I ought to say, is, that so far, the improvement in all the crops is most manifest, more especially in the Clover. But even on the Wheat and Barley, although applied invariably where the crop was weakest, its effects are so striking that a person riding along the road cannot but perceive it. I have used it for Mangold Wurzel, and shall do so for Turnips; but as yet, in the former instance, the Mangold is not up, and therefore nothing can be said of it. It is but fair also to add that I have applied it to two compost heaps; in reducing Twitch, Cabbage-stalks, and such like, to a useful compound for the land, with layers of horse dung, and, with the exception of the windward side of the heaps, where the Couch Grass or Twitch was laid quite on the outside, the heaps in three weeks became excellent manure. So far, I have never expended 18*s*. per acre on any crops, after 40 years' experience, with so much effect. I think the agriculturists, to whom I am known, will give me credit for not intentionally misleading them. I write only the result of my own experience. You will immediately send me another ton for my own use, and one for a neighbouring farmer.

Yours truly,

Cambridge, May 15th, 1854. WILLIAM BENNETT.

P.S.—I find 2 heaping bushels per acre of the Manure, with the like quantity of ashes, seems to cost about 18*s*. per acre, and in this manner we have so far used it.

Manea, near Chatteris, Cambs., May 17th, 1854.

To Mr. B. COVENEY.—SIR,—I beg to enclose an order for 24*l*. 19*s*., the amount of your account against me for Manure. I should have forwarded this a little earlier, but having used the Manure on 12 acres of Hemp, I waited to see if it had any immediate visible effect. I am happy to say I think it has, as the plant is vigorous and strong.—Yours obediently,

MICHAEL L. SEARS.

Halvergate Mills, Acle, near Norwich, May 18th, 1854.

SIR,—I am happy to give you an excellent account of the Manure. Mr. Smith, of Reedham, top-dressed a field of Wheat in the beginning of April; it was very thin and weak; he did not expect a quarter of a crop. The other day he was telling me it was wonderfully improved, and he did not think there was any in the parish looking better; so well satisfied is he with it that he has given me an order for half a ton more for top-dressing Barley, also an order for a friend of his. You are quite at liberty to advertise this, as you cannot speak too highly of it. I shall require two tons instead of one.—Yours faithfully,

B. COVENEY, Esq. JOHN HEWITT.

Eastrea, Whittlesea, Cambs., May 19, 1854.

SIR,—I have to inform you that the Wheat is going on well. On part of the ground I used your Manure, on the other part Farm-yard Manure; your Manure is quite equal to the other. I think it a very good application for Wheat. I shall like to try one ton more in the autumn for Wheat.—Yours obediently,

Mr. COVENEY. JOHN HUGHES.

N.B.—For Turnips and Root Crops generally, where the seed is sown, or the plant out of the ground, and in cases where from any cause it is weak, this Manure, mixed with about its own quantity of earth or ashes, may be put on the surface with great effect, and will be found to speedily force the growth of the plant, and give it an extraordinary vigour; or, as it quickly dissolves, it is not too late to apply it as a top-dressing for Grain Crops, where the plant is sickly or the crop patchy.

Delivered Free on to the Railways in London, Birmingham, or Manchester, at 12l. per Ton, Package included.—All orders promptly executed.

CRYSTAL PALACE, 1854.

GENERAL PUBLICATIONS.

KENILWORTH.—A Grand HORTICULTURAL and FLORICULTURAL EXHIBITION will be held (by permission) among the RUINS OF KENILWORTH CASTLE, on WEDNESDAY, July 5, when Prizes to the amount of nearly 80l. will be awarded for collections and single specimens of Stove and Greenhouse Plants, Cut Flowers, Fruits, Vegetables, &c. This Exhibition will be open to all Exhibitors without entrance fee, limitation, or other restriction, subject only to such conditions as seem necessary to secure order and equal opportunity of reward and distinction to all competitors.

Schedules and every particular may be had on application to J. CHEYNE, Secretary, Offchurch, near Leamington Spa.

NORFOLK AND NORWICH HORTICULTURAL SOCIETY.—The ROSE Show will be held at the BRACONDALE GARDENS, Norwich, on WEDNESDAY next.

Amongst others, Prizes of 3l., 2l., 1l., 15s., and 10s. will be offered for collections of 36 varieties, open to all Nurserymen and such Amateurs as are Subscribers. No entrance fee.

Norwich, June 24. ARTHUR PRESTON, Hon. Sec.

MANCHESTER BOTANICAL AND HORTICULTURAL SOCIETY.—The third Exhibition of PLANTS, FLOWERS, FRUITS, AND VEGETABLES, will be held at the SOCIETY'S GARDENS, OLD TRAFFORD, on WEDNESDAY next, June 28th, when productions may be exhibited from any part of the kingdom. Schedules of Prizes to be obtained on applying to the Secretary.

(By order), JOHN SHAW, Secretary.

Council Room, Princess Street, June 22d.

WILL CLOSE ON FRIDAY, JUNE 30.

THE EXHIBITION OF THE WORKS OF THE STUDENTS OF THE SCHOOLS OF ART, both Local and Metropolitan, now open Daily at Gore House, Kensington, WILL CLOSE on June 30.—Admission Free.

NEW BEDDING CALCEOLARIAS.

EDWARD GEORGE HENDERSON & SON, of the Wellington Nursery, St. John's Wood, London, are now sending out their splendid Bedding Calceolarias—Loveliness, Masterpiece, Matchless, Superba, and Surprise. These (the finest and most distinct in this class) were purchased of Mr. Constantine, who exhibited them at Chiswick in 1853. Price 7s. 6d. each, or 30s. the set, with the usual allowance to the Trade. The Plants are fine bushy stuff.

CINERARIA SEED.

EDWARD GEORGE HENDERSON AND SON, Wellington Nursery, St. John's Wood, London, are now prepared to forward, by post, new Cineraria Seed saved this season. More than usual care has been bestowed in gathering from the choicest named varieties, including the new ones sent out last year; all the light varieties have been discarded, consequently from the above seed we anticipate none but high coloured flowers. Per packet, 2s. 6d. and 5s. each.

Our beautiful collection of CALCEOLARIAS can now be seen in flower at the Nursery, and orders for seed booked, to be sent when ready. Per packet, first quality, 5s.; second quality, 2s. 6d.

MARKET FOR EARLY POTATOES, PEAS, FRUIT, &c.
A CARD.

HUGHES AND NEWBURY'S (Salesmen, Covent Garden Market) present prices are, Round Potatoes, 16s. and 17s. per cwt.; Kidneys, 18s. and 20s. Peas 3s. 6d. per bushel. H. & N. find basket for Potatoes consigned to them (carriage free to any railway station) at an extra charge of 7s. 6d. per ton; or guarantee the return of growers' baskets.—June 24.

BENJAMIN R. CANT begs to offer the following new FUCHSIAS and VERBENAS at the reduced prices annexed, package and carriage free to any station on the Eastern Counties Railway when the order amounts to 1l. New Fuchsias at 2s. 6d. each, or 20s. the set of nine:—Autocrat, Clio, Duke of Wellington, Elegans, Omega, Queen of Hanover, Trentham, Vanguard, and Standish's Perfection.

New Verbenas at 1s. 6d. each, or the set of 18 for 21s.:—Arlosto, Attraction, Annie Laurie, Bridesmaid, Beauty, Beauty of the Garden, Diadem, Ida, Mrs. Gerrard Leigh, Mrs. D. Tysson, Matchless, Madonna, Marie Antoinette, Ne Plus Ultra, Robin Hood, Rouge et Noir, President, and Orion.

[St. John's Street Nursery, Colchester.

CHIVAS'S ORANGE JELLY TURNIP.

SUTTON AND SONS, Seed Growers, Reading, can supply new Seed direct from Mr. Chivas at the same price as at Chester; they have also themselves grown some excellent Seed from selected Orange Jelly Turnips raised last year from seed received of Mr. Chivas, which they can strongly recommend. Purchasers of large quantities will be supplied liberally. Particulars, on application.—Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

THE FORWARDEST TURNIP KNOWN.

SUTTON'S EARLY SIX WEEKS TURNIP should now be sown for feeding off early. Excellent new Seed 1s. 3d. per pound, or 7s. per gallon.

Mr. K. HICKMAN, of Brompton House, near Newbury, in a letter dated February 1st, says:—

"*I must mention the 'Six Weeks Turnip' as the best sort I have ever seen for earliest and latest sowing. I have grown them several years, and have invariably found them to produce more feed in less time than any other Turnip. I have had them after Wheat of a good size, within six weeks from the time of sowing.*"

N.B. Carriage free, except parcels under 20s. value.—Address, J. SUTTON and SONS, Seed Growers, Reading, Berks.

CHOICE CINERARIA
AND
CALCEOLARIA SEEDS.

LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior

CINERARIAS AND CALCEOLARIAS,

which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias and Calceolarias have given for several successive years enables them to recommend their Seed of the present season with much confidence.

Packets of each, sealed and warranted by them, at 2s. 6d., free by post.—Exeter Nursery, Exeter, June 24.

BEAUTIFUL HARDY PLANT,
GYNERIUM ARGENTEUM.

LUCOMBE, PINCE, AND CO. have now for sale a few strong established specimens of this highly ornamental plant. The leaves, which are more than 6 feet in length, grow in tussocks, thereby producing a very fine effect, and from the midst of these numerous flower-stems arise to the height of from 6 to 8 feet, surmounted by graceful panicles of inflorescence nearly 2 feet long, which resemble beautiful waving plumes of silvery feathers; few plants are more elegant than this gigantic Grass, which, being perfectly hardy, is certainly a great acquisition to the ornamental grounds of this country, and it is also exceedingly easy of culture.

Size and price may be had on application to L. P., & Co., Exeter Nursery, Exeter.—June 24.

ROSES.

A. PAUL & SON respectfully invite the attention of Amateurs and Lovers of ROSES in general to the unrivalled collection growing at the CHESHUNT NURSERIES, which will be in finest condition the first and second weeks of July. Trains of the Eastern Counties Railway, from Shoreditch to Waltham or Cheshunt, almost hourly.

OSBORN AND SONS have the pleasure to acquaint the public that they are now prepared to send out the following new plants:—

OXYLOBIUM OSBORNI.

This beautiful new Oxylobe obtained the Large Silver Medal at the Chiswick Exhibition in June, 1853. From its graceful habit, and bearing its bright orange-coloured flowers in such abundance, it will, we have no doubt, become a general favourite. Price 10s. 6d. each.

LYSIMACHIA LESCHENAULTI.

An exceedingly pretty plant, with dense heads of pink flowers, raised from seeds received from the Neilgherry Hills; it is a most abundant bloomer, and easy of cultivation. It was awarded the second prize for new plants at the Regent's Park, June 1854. Price 5s. each.

PENTAS ROSEA.

A decided improvement on the Pentas carnea, having much darker coloured flowers. Price 3s. 6d. each. The usual discount to the trade.—Fulham Nursery, near London, June 24.

BEDDING PLANTS, &c.—ALL IN POTS, STRONG AND FINE.

To Mr. Tegg, Gardener to A. Prior, Esq., Dover House, Roehampton, for a dish of Black Hamburgh Grapes.
To Mr. Hughes, Gardener to J. Eaton, Esq., Shacklewell, for a dish of Black Hamburgh Grapes.
To Mr. Constantine, Gardener to C. B. Mills, Esq., Hillingdon, Uxbridge, for a dish of Black Prince Grapes.
To Mr. Busby, Gardener to J. Crawley, Esq., for a dish of Muscadine Grapes.
To Mr. Forsyth, Gardener to Baron Rothschild, for a dish of Muscats.
To Mr. Patterson, for a dish of Peaches.
To Mr. Abbott, Gardener to J. Dent, Esq., Wetherby, Yorkshire for a dish of Peaches.
To Mr. Brown, for a dish of Peaches.
To Messrs. Standish and Noble, Bagshot, for 3 New Berberis.
To Mr. M'Ewen, Gardener to the Duke of Norfolk, for 4 Pine-apples.
To Mr. Constantine, Gardener to C. B. Mills, Esq., Hillingdon, Uxbridge, for a box of Nectarines.
To Mr. Hamp, Gardener to J. Thorne, Esq., South Lambeth, for a Pine-apple.
To Mr. Dods, Gardener to Sir J. Cathcart, Englefield Green, for a Queen Pine-apple.
To Mr. Terry, Gardener to Lady Puller, for a Pine-apple.
To Mr. Chapman, Gardener to J. B. Glegg, Esq., Cheshire, for a Green-fleshed Melon.
To Mr. May, Gardener to H. Colyer, Esq., Dartford, for a Scarlet-fleshed Melon.
To Mr. Tegg, Gardener to A. Prior, Esq., Dover House, Roehampton, for a dish of Nectarines.
To Mr. Bore, Springfield, Berks, for a dish of Nectarines.
To Mr. Snow, Gardener to Earl de Grey, for a dish of Black Cherries.
To Mr. Patterson, for a dish of Black Cherries.
To Mr. Davis, Barnet, for a dish of Black Cherries.
To Mr. Snow, for a dish of White Cherries.
To Mr. M'Ewen, for 2 dishes of Strawberries.
To Mr. Iveson, for fruit of Carica papaya.

BRONZE MEDAL.

To Messrs. Fraser, Lea Bridge, for Correct Labels.
To Mr. Bragg, Star Nursery, Slough, for 24 Cut Pinks.
To Mr. Bragg, for 36 Cut Pansies.
To Mr. James, Gardener to W. F. Watson, Esq., Isleworth, for 24 Cut Pansies.
To Mr. Busby, Gardener to J. Crawley, Esq., Stockwood Park, Luton, for 25 Cut Roses.
To Mr. Morrison, Gardener to W. Parker, Esq., Ware Park, Herts, for 24 Cut Roses.
To M. Van Houtte, Ghent, for Aphelandra Leopoldi.
To the same, for Begonia xanthina marmorea.
To F. Wigan, Esq., for a collection of British Plants botanically arranged.
To Mr. Monro, Gardener to Mrs. Oddie, Colney House, St. Alban's, for a Green-fleshed Melon.
To Mr. Frost, Gardener to E. L. Betts, Esq., Preston Hall, Kent, for a Green-fleshed Melon.
To M. Van Houtte, Ghent, for Achimenes gigantea.
To the same, for a Bilbergia sp.
To Messrs. Fraser, Lea Bridge Road, for Gordonia javanica.
To Mr. Gedney, Gardener to Mrs. Ellis, Hoddesdon, for 12 Exotic Orchids.
To Mr Smith, Gardener to J. Anderson, Esq., Regent's Park, for 30 British Ferns.
To Mr. Williams, Gardener to C. B. Warner, Esq., for 1 dish of Black Hamburgh Grapes.
To Mr. Lushey, Gardener to J. Hill, Esq., of Streatham, for 1 dish of Black Hamburgh Grapes.
To Mr. Smith, Gardener to S. Ricardo, Esq., for 1 dish of Black Hamburgh Grapes.
To Mr. Hill, Gardener to R. Sneyd, Esq., Stafford, for 1 dish of Black Prince Grapes.
To the same, for 1 dish of Peaches.
To Mr. Watson, Ealing, for 1 dish of Peaches.
To Mr. Iveson, Gardener to the Duke of Northumberland, Syon House, for 1 dish of Peaches.
To Mr. Smith, Gardener to S. Ricardo, Esq., Totness Park, for a Green-fleshed Melon.
To Mr. McEwen, for a Green-fleshed Melon.
To Mr. Whiting, the Deepdene, Dorking, for a do.
To Mr. Jupp, Gardener to — Headlands, Esq., Woodlands, Redhill, for a Scarlet-fleshed Melon.
To Mr. Constantine, Gardener to C. B. Mills, Esq., Hillingdon, for a dish of Figs.
To Messrs. Mitchell, Brighton, for a dish of Black Cherries.
To the same, for a dish of White Cherries.
To Mr. Hume, Gardener to R. Hanbury, Esq., Ware, for 2 dishes of Strawberries.
To Mr. Busby, for Strawberries.

CERTIFICATE.

To Messrs. Fraser, Lea Bridge, for Correct Labels.
To Mr. Carson, Gardener to W. F. G. Farmer, Esq., Cheam, for Correct Labels.
To Mr. Bryan Whitton, Hounslow, for 36 Cut Pansies.
To Mr. Turner, Slough, for Seedling Pelargoniums Vesper and Phaeton.
To Mr. Dobson, Isleworth, for Seedling Pelargonium Laura.
To Mr. Hume, Gardener to R. Hanbury, Esq., Poles, Herts, for 24 Cut Roses.
To Mr. Halley, Nurseryman, Blackheath, for a Seedling Fancy Pelargonium, Enchantress.
To Mr. Smith, Nursery, Hornsey, for a box of Verbenas.
To M. Van Houtte, for a new species of Acer, from Japan.
To Mr. Smith, Nursery, Hornsey, for Seedling Calceolaria Vesper.
To Mr. M'Ewen, Gardener to the Duke of Norfolk, Arundel, for a dish of Strawberries.
To Mr. Smith, Gardener to G. Elliott, Esq., Benfield, Berks, for 1 dish of Black Hamburgh Grapes.
To Mr. Chapman, Gardener to J. B. Glegg, Esq., Whittington Hall, Cheshire, for 1 dish of Black Hamburgh Grapes.
To Mr. Morrison, Gardener to A. Donovan, Esq., Framefield, Sussex, for 1 dish of Judson's Seedling Grape.
To Mr. Collinson, for a dish of Figs.
To Mr. Iveson, Syon House, for a dish of Figs.
To Mr. Marcham, Gardener to J. Smith, Esq., Hanwell, for a dish of Cherries.
To Mr. Head, Worthing, for a dish of Cherries.
To Mr. Gainsford, Brentford, for a dish of White Cherries.
To Mr. Wortley, Gardener to Mrs. Maubert, Norwood, for 2 dishes of Strawberries.
To Mr. Reid, Sydenham, for 2 dishes of Strawberries.
To Mr. Waterer, Bagshot, for Rhododendron John Waterer.
To Mr. Monro, Gardener to Mrs. Oddie, St. Alban's, for a Cucumber, "Durham Park Hybrid."
To Mr. Salter, Versailles Nursery, Hammersmith, for Iris germanica.
To the same, for Cut Chinese Pæonies.
To Mr. Hill, Gardener to R. Sneyd, Esq., Stafford, for a Green-fleshed Melon.
To Mr. Gardiner, Gardener to Sir T. Phillips, Warwick, for a Green-fleshed Melon.
To Mr. Henderson, Gardener to Sir G. H. Beaumont, for 12 lbs. of Grapes.
To Mr. Solomons, Peckham, for 12 lbs. of Grapes.
To Mr. Spary, Brighton, for 12 lbs. of Grapes.
To Mr. Monro, Gardener to Mrs. Oddie, St. Alban's, for 12 lbs. of Grapes.
To Mr. Head, Worthing, Sussex, for 12 lbs. of Grapes.

NEW SIPHOCAMPYLUS.

W. J. EPPS has much pleasure in offering the following, feeling they cannot fail to give the highest satisfaction. Strong plants are now ready for delivery.

SIPHOCAMPYLUS NE PLUS ULTRA.—Very dwarf habit, with bright green foliage, producing flowers of the most brilliant scarlet in threes and fours at the axle of every leaf; the best of the genus, 10*s.* 6*d.*

BICOLOR ROSEA.—Deep crimson, tipped with pale rose, very distinct and beautiful, very dwarf and compact habit; 10*s.* 6*d.* The usual discount to the Trade.—Nurseries, Maidstone.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21*s.*

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gauffred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21*s.*

THE NEW RHODODENDRONS OF ASSAM & BOOTAN, COLLECTED BY THOMAS J. BOOTH, ESQ.,

AND DESCRIBED IN THE "MAGAZINE OF BOTANY," BY HIS UNCLE THOMAS NUTTALL, ESQ., OF RAINHILL, THE WELL KNOWN BOTANIST AND TRAVELLER.

E. G. HENDERSON AND SON, Wellington Road, St. John's Wood, London, have much pleasure in announcing that they have for Sale these, the most remarkable new species of RHODODENDRONS ever introduced into this country, many of which surpass those fine species from Sikkim, discovered by Dr. Hooker. Amongst these brilliant discoveries from the Bootan Alps, we have the most wonderful sized flowers, delicious fragrance, and distinct colours of any that are known to exist in this most gorgeous tribe of plants, which, combined with the magnificent foliage and distinct habit of growth, will render them indispensable, and a great acquisition both for the garden and conservatory.

The entire stock of all these extraordinary species now growing in the Gardens at Rainhill (June 20th, 1854), have been purchased by Messrs. E. G. HENDERSON & SON; the plants are fine, healthy, and robust; many of the species have been planted out in the open ground, and (with the exception of one or two slightly injured by late spring frosts), have proved quite hardy.

Orders will be executed as soon as the young growth is sufficiently ripened for travelling.

We are now taking orders for the above plants at the prices subjoined:—

Per single plant of each species	2 Guineas.
„ 4 plants of either	6 „
„ 8 „ „	10 „
„ 12 „ „	12 „

RHODODENDRON NUTTALI.—This distinct and magnificent greenhouse species was discovered on the Duphla hills, at Meré Patar, about Seram's village, on the banks of the Pappo, at an elevation of 4000 to 5000 feet above the sea level. Leaves 8 inches long by 4 inches wide, of a very thick coriaceous substance, so as to be quite opaque, oval, and obtuse; smooth above, except when in a young state; very strongly veined and reticulated beneath, and scarcely paler than above; in adult leaves brown, with numerous resinous scales, the young leaves and growth of a bright purple red. Flower cone a little more than 2 inches long by 2 inches wide; the scales thick and coriaceous, with silky margins internally. Corolla (or flower) subcampanulate, the border spreading, five-lobed, white with a tint of rose-red, and yellowish at the base within, 5 inches long, and exceedingly fragrant. The blossoms individually of this magnificent species are much larger than the Sikkim Rhododendron Dalhousieanum. It has been named in compliment to the veteran botanist and traveller, T. Nuttal, Esq.

RHODODENDRON WINDSORII.—A fine hardy species, discovered on the mountains of Bootan, growing at an elevation of 7000 to 9000 feet above the sea, on the ridges and slopes of Roophrye, in exposed and arid situations, with Pines, species of, Cupressus, Berberis, &c. Leaves coriaceous, obovate, lanceolate, and acute, 4 to 5 inches long, by 1½ broad, strongly reticulated and pinnately nerved, shining white and silvery beneath, at length pale brown; heads many-flowered. The bracts dilated and silky; the lobes of the corolla emarginate, the colour a beautiful deep crimson scarlet, much deeper coloured than arboreum; the calyx is minute.

RHODODENDRON LONGIFOLIUM.—A magnificent foliaged plant, discovered in the forest of Bootan, on the slopes of the Oola mountains, at an elevation of 6500 to 7500 feet above the level of the sea. The leaves 12 to 18 inches long, 2—4 wide in the middle; at first pubescent, at length smooth or nearly so, gradually narrowed downwards, obovate, lanceolate, silvery and whitish beneath, strongly reticulated as well as veined. Buds very large, capsule 2 inches long and about 1 inch wide, altogether a very distinct and majestic species. To all appearance nearly hardy in this climate. The adult leaves almost resembling those of Magnolia umbrella.

RHODODENDRON CAMELLIÆFLORUM.—A very curious greenhouse species, discovered in the valley of Lablung, also on the Bootan Alps, at the latter place growing at an elevation of 9000 to 12,000 feet. In foliage it resembles R. Maddeni, 3 to 5 inches long; flower stalks axillary or terminal, very short and stout; corolla sparingly scaly, 1½ inch across, of a very thick texture, pure white with faint rosy tinge, all the segments obtuse and entire, the flower strongly resembling that of a single Camellia, from which its name is derived. A very distinct flower.

RHODODENDRON JENKINSI.—Discovered in Bootan, on the southern slope of the Oola Mountain, at an elevation of about 6000 to 7000 feet above the sea level, but exceedingly scarce even in this locality, accompanied by Pinus excelsa. It has leaves 4—6 inches long by 2 in width, coriaceous and shining above, oblong-lanceolate and acute, usually cuneate below, at first glaucous, but at length brown, from a dense clothing of somewhat resinous scales. Flower-buds very large and broad, corymb mostly six-flowered. This species, according to a specimen in the herbarium of Sir William Hooker, was also found by the indefatigable Mr. Griffith, on the Khasya Hills. It has been named in honour of Major Jenkins, of the East Indian service, who has done so much for the botany of that country.

RHODODENDRON KEYSI.—From the mountains of Bootan, at an elevation of 9000 to 10,000 feet. A perfectly hardy species, growing on the northern ridges of Lablung and its native hills amidst snow 2 to 3 feet deep. The leaves are 2½ to 3 inches long, about 1 inch wide, opaque, coriaceous, smooth, and lanceolate; ovate, almost covered with brown circular resinous scales, corolla apparently tubular or unceolate; rather aromatic from the resinous scales with which the leaves are clad beneath. Corymb compounded of three or four branches each, containing five or six flowers. Calyx five toothed—small; the teeth nearly equal and obtuse. Corolla (judging from the withered remains only) apparently tubular or urceolate; the border five lobed and reflected. The segments ovate obtuse.

PHLOX DRUMMONDI RADETZKI.

JOHN CATTELL has a large stock of this very beautiful PHLOX, which is a great improvement on Mayi, having the white clearer, and the purplish crimson much deeper and brighter; every flower comes as regularly and constantly striped, and the habit of the plant is more robust; it is so very handsome that it must become a general favourite. Good Plants, 3*s.* 6*d.* each, or 36*s.* per dozen; extra fine Plants, 5*s.* each. A liberal discount to the trade. A flower may be had on application, enclosing a penny stamp.

J. C. has also to offer the following very desirable plants, well established:—

	Each.
GERANIUM, crimson ivy-leaved	2*s.* 6*d.*
GERANIUMS OF THE SCARLET HABIT.	
Trentham Rose, beautiful rose	2 6
Rosea superb, beautiful cerise rose, large truss, dwarf, strong habit	2 6
Baronne Hugel, light scarlet, white eye, very dark horse-shoe leaf, extra dwarf habit	2 6
Boule de Neige, white, large truss, horse-shoe leaf ...	2 6
Miss Emily Field, delicate pink, large truss, horse-shoe leaf	2 6
Skeltoni, white fading delicate pink, large truss ...	2 6
Kingsbury Pet, rosy salmon, large truss, horse-shoe leaf	2 6

One each of the above eight, 16*s.*

GERANIUMS WITH VARIEGATED LEAVES.	
Golden Chain	1 6
Kinghorn's Attraction	10 6
„ Silver King ... ... 5*s.* to	7 6
Gaines' Attraction	3 6
„ Mount Hecla	3 6

Delphinium Wheeleri 1*s.* 6*d.*	Delphinium Hendersoni 5*s.* 0*d.*
„ semplex alba plena 3 6	„ magnificum ... 5 0
„ Weltoni 2 6	Petunia MontrealPurple 1 6

Anemone pavonia, brilliant scarlet, double, very hardy, flowers in March and April, Bulbs now ready to transplant, 4*s.* per dozen, or 25*s.* per 100.

A remittance or reference to accompany all orders from unknown correspondents.—Westerham, Kent.

BASS AND BROWN'S NEW POTENTILLAS.—In consequence of the limited stock of King of Crimsons, we regret we must decline receiving more orders. The following are now ready to send out:—

Potentilla Sudbury Gem, each ...	10*s.* 6*d.*	Potentilla Theodore, each	7*s.* 6*d.*
„ Shylock, do. ...	10 6	„ Julia, do.... ...	7 6

The following, 16*s.* the set of seven varieties:—

Floral Beauty	3*s.* 6*d.*	Scarlet Gem	3*s.* 6*d.*
Napoleon	2 0	Primrose	2 0
Defiance...	2 0	Argo	2 0
Negress	3 6		

For descriptions and editorial remarks, see *Gardeners' Chronicle* of March 13, p. 144, and April 1, p. 208.

The Gardeners' Chronicle.

SATURDAY, JUNE 24, 1854.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, June	27—Horticultural	3 P.M.
WEDNESDAY, —	28—Microscopical.....	8 P.M.
THURSDAY, —	29—National Floricultural.....	3 P.M.

UP to the present time Mr. DRUMMOND'S committee on the WOODS AND FORESTS shows little sign of life. Two or three meetings have been held with CLOSED DOORS, and a few rumours have found their way into public. It is said that the committee has resolved to limit its inquiry within the narrowest possible limits, and that all great points at issue are to be carefully avoided. Some of the deputy surveyors appear to have been examined; and whether it is better to saw timber previous to sale, or to sell it in the round, is reported to have been a subject of discussion. If this be all, we may be pardoned for asking why the committee was moved for?

In the meanwhile the administration of the Woods and Forests has been placed in its true light by Mr. KENNEDY himself, who, in a pamphlet just published, has ably and resolutely vindicated his official conduct;* and at the same time shown what that Treasury system is which has ended for the present in keeping incapable surveyors in office, and in depriving the country of an honourable and efficient public servant. We most earnestly recommend the right honourable gentleman's defence to the perusal of all who have the interests of the country at heart, and are independent enough to call trickery by its right name, and to regard jobbing as a crime.

What a hotbed of iniquity the Woods and Forests were not many years ago needs not now be told. The public revelations concerning Chopwell woods, Salcey, and the New Forest, and private scandals which no official dexterity could wholly conceal, excited such universal indignation as to alarm even patronage secretaries, and attract the serious attention of the highest members of Government. At this time it became necessary to secure at the Board of Works the services of resolute and experienced public officers, who were known to be proof against what is called influence. Mr. KENNEDY, who had greatly distinguished himself by a successful public career in Ireland, in a post of very considerable difficulty, and whose important services are acknowledged in a Treasury minute of March 30, 1847, was selected, at the recommendation of Lord JOHN RUSSELL, as one of the commissioners. He tells us that he accepted office with a desire "that its duties should be performed to the utmost for the benefit of the public service," and "with a determination to administer its affairs as the interests of the Crown and public demanded." He assumed his charge with a feeling similar to that which he would have entertained had he been "called upon to administer, as guardian or trustee, the territorial possessions of some great nobleman, for the permanent benefit of the inheritance and for the advantage of the tenant for life." No course of action could have been more mistaken; the "Treasury" soon gave him to understand that they wanted something else.

In what state the Royal forests were at the time when Mr. KENNEDY assumed the control we have long since stated. Every word that we then said is by him confirmed. He found that 100,000 acres had yielded in 1849 6000*l.* less than nothing, and that the net revenue in 1850 was only 159*l.*; and thinking this a very extraordinary state of affairs, he set about trying to improve it. A pleasant task it proved to be.

In the country he found, with one exception, a universal disposition among the officers under him to throw difficulties in his way, so that he had at once to determine whether he would be a passive commissioner or a responsible officer of the Crown; whether he was to be a tool for registering opinions, and carrying on a smooth course of administration, which from its inefficiency and subservience should not create resistance, or to do his duty. In seeking to follow what he considered an upright course of action, he was on almost all occasions met by resistance founded on the consciousness that an altered course of action implied a condemnation of the past. He was unsupported by the Treasury, and thwarted in the country.

It was under these circumstances that Mr. KENNEDY sought in Mr. BROWN, the eminent Scotch forester, that counsel and assistance which was unobtainable from the Treasury or its agents. And thus arose the long series of reports upon the Royal forests, which has been published by Parliament, which we have read with great attention, and which constitutes, in our opinion, a body of sound advice of the utmost practical value. But this did not suit the Treasury, where Mr. KENNEDY found "a latent determination to support the past system of maladministration, sacrificing the public interest to *that system of patronage and favouritism which has been the bane of the affairs of the Royal forests.*" The result was that, in the long run, the Treasury found what they thought a good opportunity of getting rid of a troublesome commissioner, who presumed to believe that he had a higher duty to perform than playing into the hands of a jobbing Government officer; and they used it most unscrupulously.

By means of a packed tribunal, a report was obtained in which the Treasury imagined they saw a capital case for dismissal. We have formerly pointed out the discreditable composition of this tribunal; but Mr. KENNEDY goes more fully into its examination, and so clearly shows the *animus* which led to its appointment that we must give his words almost verbatim.

"Of two of the referees I never before heard the names, and could find no one to whom they were known. As to the third member of the tribunal, Mr. MENZIES, he was once a subordinate under myself, but is now under the Commissioner administering the other branch of the office, *where are also found among* Mr. MENZIES' *superiors the son and son-in-law of* Mr. HIGGINBOTHOM, *of that very deputy surveyor the merits of whose dispute with* Mr. BROWN, *and official reports to me, this jury had to try.*"

In framing the instructions under which the trio were to act, Mr. JAMES WILSON, one of Secretaries of the Treasury, who has evidently been at the bottom of the whole intrigue, by a species of legerdemain, which we admit to be ingenious, and wish we could call honest, contrived to jumble together assertions by Mr. BROWN, as to a class of facts disputed by the deputy surveyor, and a stern reproof by Mr. KENNEDY for his suppression of facts, for which suppression no excuse has been offered or was possible. But we must here allow Mr. KENNEDY to speak for himself.

"I need hardly remind the reader that there was no question of a disputed fact between me and Mr. HIGGINBOTHOM, but that, on a fact asserted by me and admitted by Mr. HIGGINBOTHOM, an imputation was founded by me of his intention to deceive me; and I now learned that it was the determination of the Treasury *to mix up* the question of the justice or injustice of this charge made by me against a subordinate officer, with the question of the accuracy of the facts relating to the condition of the forest reported on by that officer, and by Mr. BROWN; and that the charge made by me was to be converted into a question of simple fact between me and my subordinate officer, and referred as a question involving my *veracity, integrity, and honour*, as well as his, to a tribunal consisting of two professional gentlemen, and the deputy surveyor of Windsor Forest, who but a short time previously had been himself my subordinate officer, and was still a subordinate officer of the Commis-

* Letter to the Right Honourable Lord JOHN RUSSELL, from the Right Honourable T. F. KENNEDY, relative to his removal from the office of Commissioner of Woods, Forests, and Land Revenue of the Crown; with Lord JOHN RUSSELL'S Reply, and Remarks and Correspondence. RIDGWAY.

sioner of Land Revenue. I should mention that the names of the parties who were thus selected to try this cause, so described by the Treasury, *were not submitted to me for remark, or objection, or acquiescence.* Notwithstanding the disputes of recent date which had arisen between the Treasury Board and me as to the mode in which I had conscientiously thought it incumbent on me to execute the duties of my department, their lordships seem to have considered it becoming *to nominate* the jury, and *send my case for trial* before it, not merely *without my acquiescence*, but without informing me of their intention until it was executed; and thus a privy councillor and a head of a department was without notice brought to trial on a question, stated to be one affecting his veracity, his integrity, and his honour, before a jury nominated by those with whom he had recently been *engaged in warm disputes.*"

The referees produced a report in which, so far as Mr. KENNEDY is concerned, they expressly declare that the suppression of fact by the deputy surveyor, of which Mr. K. complained, *had taken place;* all they can say is that they would not themselves have been misled by it, and do not think it culpable—concerning which, we presume to observe, there may be two opinions.

However, the Treasury acted upon the report as if the fact complained of had *not* taken place; and the CHANCELLOR of the EXCHEQUER forthwith proceeded to dismiss Mr. KENNEDY. One would have thought that before adopting so strong a measure as the sudden removal from office of a Commissioner of her Majesty's Woods and Forests and a Privy Councillor, Mr. GLADSTONE would have deemed it necessary to consult the head of the Administration. Not at all; Lord ABERDEEN was not "informed of the circumstances." Lord JOHN RUSSELL, upon whose recommendation Mr. KENNEDY had been appointed, and to whom common courtesy would have ensured some intimation, knew no more than Lord ABERDEEN; he declares that, even on the 9th of June, five weeks after the removal, the circumstances which led to Mr. KENNEDY's separation from the public service were only partially known to him; and we have reason to believe that other members of the Cabinet were equally in the dark.

The very narrow limits within which our observations are necessarily confined compel us reluctantly to shorten our remarks. We have, however, printed at length, in another column, Mr. KENNEDY's letter to Lord J. RUSSELL, and the reply. It is impossible to peruse Mr. KENNEDY's pamphlet without the most painful feelings; for it discloses a system of misgovernment which we had before supposed to be impossible in England. As to the conduct of Mr. WILSON in the matter, we can only say that, if there is one man of spirit in the House of Commons who remembers what was said about Lord DERBY's Government and the Admiralty, he will lose no time in placing the honourable member for Westbury in the position formerly occupied by Mr. AUGUSTUS STAFFORD.

Mr. KENNEDY acquits of all participation in this intrigue the CHANCELLOR of the EXCHEQUER, who we sincerely believe to have acted throughout under false impressions. That Lord ABERDEEN and Lord JOHN RUSSELL should have been concerned in it nobody would have suggested, even in the absence of the precise disclaimers of those noble lords. But somebody is concerned, and Mr. WILSON knows who. It is to him that Parliament must look for information concerning the "persons of great station, in the Government and out of the Government, in Parliament and out of Parliament," who urged him to thwart the Commissioner, to back the deputy surveyors, to palter with his own duty to the Crown, and, finally, to take that line of action which has compromised for ever his official character.

The hon. member for Westbury, after insolently questioning the "veracity, integrity, and honour" of as high-minded a public officer as ever had the misfortune to serve his country, coolly announces the readiness of "My Lords," that is to say of himself, to justify their proceedings in Parliament. Surely some one will give him the opportunity. If Mr. KENNEDY can substantiate his allegations, and no one doubts it, there is here as flagrant an instance of malversation in office as modern history can produce. The right hon. gentleman urges upon Lord JOHN RUSSELL, as leader of the House of Commons, the justice of granting an impartially chosen committee of inquiry to be named by the committee of selection; and his lordship does not object.

In quitting the subject for the present we cannot avoid quoting Mr. KENNEDY's concluding observations as to the manner in which the management of the Royal forests should henceforth be conducted. It is alike valuable as a warning and reproof.

"Before concluding this statement I am desirous to advert to some considerations of a general character, which appear to me to be of the utmost importance in reference to the administration of such a department as the Office of Woods. It is no doubt essential that a commissioner should be under the control of the Treasury on important matters of pecuniary disbursement; but it does seem to me that with reference to the administration of rural affairs, there cannot be a more vicious arrangement than that a commissioner conducting them should be placed under the control of one or other of the political secretaries of the Treasury for the time being. The department is thereby placed in immediate contact with the dispensation of patronage, and directly subjected to all the evil influences which govern that dispensation. But apart from this obvious consideration, a political secretary is an officer constantly changing, and not necessarily qualified to understand or control rural affairs; neither has he time to attend to them with that deliberation on the one hand, or despatch on the other, which various circumstances constantly render indispensable. The result is that most mischievous delays take place, and that the practical power devolves on some subordinate and irresponsible officer in the Treasury, who, assuming the name of 'My Lords,' procures the signature of some high officer, and thus the supreme authority may be and constantly is exercised with very little knowledge, or without the matters to be disposed of having been considered by any competent and responsible officer. I must venture to say, as the result of my experience, that the only safe and satisfactory arrangement for the public service would be that some high, ostensible, responsible, and *permanent* officer in the Treasury should be charged with the department of the Woods, Forests and Land Revenues of the Crown, and that there should not be a constantly changing administration of those affairs; the practical result of the present system being that the real management is to a great extent conducted by subordinates unknown to the public as depositories of power and practical control. I consider the present system to be fraught with the most serious evils in the conduct of the public affairs of a department which has attracted a very unenviable share of public attention, and which must continue to do so until a sound spirit of administration is introduced into it, in all its branches and ramifications."

VEGETABLE PATHOLOGY.—No. XXV.

114. THE grains of pollen, whether separate or combined, when in contact with the moist stigmatic surface, germinate precisely as the spores of many cryptogams insinuating their germinating tubes into the intercellular passages of the loose stigmatic tissue, ultimately arriving at the cavity of the pistil, and entering the open end of the ovules or micropyle. In some cases, however, as in Conifers, the ovules are themselves naked, and there is therefore no necessity for any intermediate stigmatic tissue. In either case, however, the ultimate result is the same, as also the phenomena exhibited by the pollen tube, the tip of which comes in contact with the delicate embryo sac, in consequence of which an interchange between their contents by means of endosmose and exosmose takes place, and an embryo is formed within the embryo sac, at first consisting of a single cell, but gradually progressing to the formation of a true mono- or polycotyledonous embryo, surrounded by its proper integuments, and immersed or not, as the case may be, in albumen. The radical point of this embryo is always essentially directed to the micropyle, though deviations from this direction may take place in the course of growth.*

115. According to Schleiden, the end of the pollen tube pushes forward and finally inverts the upper portion of the membrane of the embryo sac in a way similar to what takes place in the animal kingdom; the sac then closes round the tube, the extremity of which becomes organised and ultimately forms the embryo. This notion is now, however, entirely exploded, except by a few partisans in Germany, and may safely be considered as erroneous. According to Schleiden's view, the embryo sac is a mere receptacle, and in the case of dicœcious plants, the new plant is actually introduced from a distinct stock. This is indeed agreeable to certain theories which have met with favour as to the function of spermatozoa; but careful examination does not confirm the observations which at one time attracted so much attention. The fact of the formation of true embryos in the embryo sacs of Cœlebogyne ilicifolia, without the intervention of pollen, a fact which, however marvellous, is beyond all doubt, alone a convincing proof in the same direction. Spallanzani, indeed, long since noticed the same thing in Hemp, and fertile seeds are often produced in different varieties of Violets, where the stamens are apparently abortive. M. Brongniart has informed me that in the latter case he has frequently found a single pollen grain in stamens otherwise abortive, and it is notorious that a few stray stamens are often produced in the females of dicœcious plants. In the Cœlebogyne, however, not the slightest trace has ever been found of stamens, which if present at all must be tolerably numerous, as the greater part of the pistils bear perfect fruit.

116. In some plants, as in certain Arads, a considerable degree of heat is elicited during the time of impregnation. It is very probable that this may be the case in many instances where it is not easily applicable. The pollen grains, at least, of many plants germinate freely, when the temperature of the surrounding air is but slightly above freezing, especially when there is not much free moisture, and it is possible that their germination may be assisted by some accession of temperature in the stigmatic surface.

117. The cause of the change produced by the contact of the embryo sac and pollen tube will probably remain a mystery for ever. The change is not, however, confined to the mere vivification of one or more cells, for in some plants more than a single embryo is formed within the same sac, but where there is a difference between the plant impregnated and that from which the pollen falls on the stigma, the embryo partakes in some measure, in essence at least, of the nature of that plant. In general this change is not perceptible till the seed has germinated and produced a new plant; but, in the case of Peas, at least, the effect is soon apparent, for if a Pea with a white seed is impregnated with the pollen of one which has a dark seed, the produce often exhibits some intermediate tint, of which a very remarkable instance occurred within our own observation in the mutual impregnation of two varieties of Sugar Peas,* the produce of neither of which in the slightest degree resembled the parent. *M. J. B.*

* In Leszczyc-Suminski's curious treatise on the impregnation of Ferns, the spermatozoids are described as penetrating into the embryo sac, and being there transformed into a new plant. Later observations have not confirmed these views, and a strong *à priori* argument against their justice is the circumstance of the radicle being inferior instead of superior, as in all phænogams.

DESCRIPTIONS OF NEW PEARS CULTIVATED BY M. DE LIRON D'AIROLES, AT LA CIVELIERE, NANTES.—By HIMSELF.

(*Continued from p.* 389.)

Duchesse de Berry.†—This is naturally classed among the Doyennés. In some catalogues it is confounded with the Doyenné d'Été, from which, however, it is very different. The tree is vigorous and very productive. The fruit is middle-sized, somewhat larger than the Doyenné d'Été, or Doyenné de Juillet. Skin smooth, pale green, dotted with brown. Stalk short and thick. Flesh white, crisp, juicy, and sugary. Ripens at Nantes between the 15th of August and the 15th of September. This variety was discovered by M. Bruneau, nurseryman, at Nantes. Among a number of seedling trees at a place called the Barrière de Fer, commune de Saint-Herblain, he observed two trees, the fruits of which appeared to possess merit; to one of them he gave the name of Duchesse de Berry, and to the other that of Saint-Herblain d'Hiver, and introduced them into his nursery in 1827.

Saint Herblain d'Hiver.—The tree does not succeed well on the Quince stock, but on the Pear stock it is tolerably vigorous, and is suitable for standards or pyramids. The fruit bears considerable resemblance to the Easter Beurré, from which it has probably been raised, and at first sight might be mistaken for it. It is of medium size, or rather small when the tree is heavily loaded. Skin smooth, green, sprinkled with small brown dots. Stalk short, deep brown. Flesh fine, white, juicy, and sugary. Although the tree is not so vigorous as many others, yet it appears deserving of cultivation, as the fruit keeps till late in the season.

Marie-Anne de Nancy.—Tree moderately vigorous, and likely to prove a good bearer. Fruit middle-sized, turbinate, about 9 inches in circumference. Skin smooth, green, streaked and speckled with russet, becoming yellowish when fit for use. Stalk scarcely half an inch in length, clear brown, thick and fleshy. Flesh white, very melting and buttery, with abundance of sugary vinous juice. Ripe in September and October. From seed by Van Mons.

Docteur Trousseau.—The tree bore for the first time in 1848. It is entirely destitute of thorns, which is rarely the case with Pear trees that have recently been raised from seed. Fruit large, pyriform, broad near the eye and contracted near the stalk; it is 4 inches in height and 3 inches in diameter. The stalk is strong and woody, about an inch in length, sunk at its insertion. Skin green, spotted with red and sprinkled with gray dots. Flesh fine, white, melting, buttery, with abundance of sugary perfumed juice. Ripe in November and December. Raised by M. Alexandre Bivort.

(*To be continued.*)

ADAMIA VERSICOLOR.

FOR some time after the introduction of this plant it was generally complained of as being a shy bloomer, and some persons still experience the same difficulty in its culture. It certainly cannot be considered a first class plant, the flowers not being high coloured, nor very showy, but with proper management it is a most profuse bloomer, its Hydrangea-like heads of flowers being produced in succession for months, and remain long in perfection; and when seen in the form of a well grown specimen, with every shoot terminated by a head of flowers, it is well deserving of a place in even select collections.

Propagation is readily effected by means of cuttings of the young wood in a rather firm state. These should be selected as early in the season as they can be obtained, and planted in light sandy soil, covered with a bell glass, and afforded a gentle bottom heat. In the course of about a month they will probably be found to have struck root, and as soon as this is the case they should be potted singly in small pots; for keeping them in the cutting pots longer than is absolutely necessary tends to produce a weak habit of growth, and

* The varieties in question were two distributed by the Horticultural Society, under the names of Pois géant sans Parchemin and Pois sans Parchemin Blanc à Grandes Cosses, one of which has purple flowers and maple seeds, the other white flowers and whitish seeds.

† This should be called Duchesse de Berry d'Été, to distinguish it from another Pear lately sold under the name of Duchesse de Berry, and which has proved to be the Uvedale St. Germain.

in all cases this should be avoided as far as possible. The young plants should be placed in a close, warm, moist place, and carefully shaded from the sun for about a fortnight after potting singly, by which time they will have taken to their pots, and may be treated as established. After this they should be placed in a close pit, or moderately warm house, keeping them near the glass and syringing them over-head on the mornings and afternoons of bright days. Being of a very free habit of growth, if all goes on well, a shift will soon be required, and they should not be allowed to suffer for want of pot room in this stage, but should be shifted into pots two sizes larger as soon as they require it, kept moist and rather close until the roots strike into the fresh soil. When this is the case give air freely on every favourable opportunity, in order to induce a strong compact habit of growth, and, if necessary to keep the plants bushy, stop the leading shoot; but if a vigorous root action is maintained, stopping will hardly be necessary. Where the object is to grow large specimens before flowering, the plants should be kept growing as rapidly as possible during the summer and autumn, affording them pot room as may be necessary, and a gentle bottom-heat would be of great assistance towards inducing rapid growth. The best situation for them in winter will be an intermediate house, where the temperature may range about 50°, for they should not be checked either by too low a temperature or the want of water, as this would probably produce a tendency to flowering, and cause some difficulty in getting them to start away freely in spring, and neither should they be kept so warm as to encourage growth. About the beginning of March will be the proper time to place them in growing circumstances, and with suitable convenience and attention fine plants will be easily secured by autumn. They should be placed in a gentle bottom-heat, kept near the glass, and as soon as growth commences, the roots should be examined, giving a liberal shift if necessary. Keep the shoots nicely tied out to prevent their growing too closely together and injuring each other; and make sure of having the specimens well furnished towards the bottom. A second shift will probably be required towards May, and this should be into the flowering pots, the size of which must be regulated by circumstances; a 15-inch pot will be sufficiently large for a fine specimen, and will no doubt be found large enough for plants of but two seasons' growth. Stopping must not be practised later than the middle of August, and the plants should be kept rather dry at the root, and more freely exposed to air from the end of September to the middle of November, which will mature the wood, and prepare it for flowering. By placing them in heat, and supplying them liberally with water, they will soon show flower at the end of every shoot; and if removed to a close part of the conservatory just as the buds begin to assume their blue colour, and protected from damp, they will remain in this state for some three or four months, for they will hardly open in the temperature of the conservatory, and in this state they have a very pleasing appearance. The flowers will, however, open freely in the temperature of an intermediate house, where, if the roots are well supplied with weak manure water, and a moderately dry atmosphere maintained, they will last long, and, on plants that have been properly ripened, will be produced in succession from the side shoots for months. Specimens intended to be grown on for further use, must be cut back in time to allow of their making a short growth before winter, and should be repotted every other year; but by supplying them liberally with manure water, they may be kept in health in good sized pots for several seasons without repotting. The best soil for this plant is three parts good strong fibry loam, and one part peat, or leaf-soil, mixed with a proper quantity of sand and lumpy bits of charcoal, to keep it open and porous; for if grown in light rich soil, the wood is apt to be long-jointed, and the specimens rather inclined to straggle. *Alpha.*

Home Correspondence.

Kennington Park.—"Mr. Spooner wished to know what the sum of 2365*l.* special services connected with Kennington Common meant, in addition to the sum of 753*l.* 13*s.*?"—"Sir William Molesworth said that the item for special services was incurred in laying-out the new park and providing it with new shrubs. This outlay would not occur again, and had no connection with the maintenance of the new park." On reading the above in the *Times* of the 8th inst., I was naturally led to suppose that the new park at Kennington had been not only well and judiciously laid out, but also planted with such trees and shrubs as would indicate that the selection was made by persons of sufficient knowledge and good taste to enable them to choose those only which would be most suitable for the locality, and likely to give the ground eventually a park-like appearance; and my curiosity having been excited by reading the answer of Sir Wm. Molesworth, in the House of Commons, that no such expense would be again incurred with regard to the purchase of shrubs, &c., I accordingly made Kennington Common the subject of a visit a day or two ago; but what was my surprise and disappointment at finding this fine piece of ground stocked with the most worthless rubbish in the shape of trees and shrubs that can possibly be imagined! There does not appear to have been the least judgment exercised in the matter; the whole of the planting forcibly suggesting the idea of the refuse of some nursery stock, which it is evident has been handsomely paid for, and the public money thus wasted for a quantity of stuff that would disgrace the meanest garden patch round London; while, had the trees been properly selected, one-fourth of the number would have sufficed. To show the style and quality of the planting, I may mention that a row of Lombardy Poplars extends all round the enclosure, the trees being at a distance of 5 or 6 yards apart, and as poor and naked as you can well conceive, and worth apparently about 10*s.* or 15*s.* per 100. There are also Hollies without any leaves, and Azalea ponticas in a scarcely better condition planted on raised banks of red earth, with several other kinds of trees which are evergreens in anything but appearance. The 48 or 50 common ponticum Rhododendrons, planted about the model house, are, however, not so bad in quality as the rest. Now, when Sir W. Molesworth said that "this outlay will not occur again," I have not the least doubt that the right hon. baronet believed he was stating the truth; but I beg to assure him that it will "occur again," from the circumstance of his not employing competent persons to execute the work on the one hand, and from his looking for a "cheap" market where only the most despicable articles are to be obtained on the other. In fact I know of no London nurseryman who would suffer such stuff to occupy his ground. I am the more anxious to call public attention to the planting and laying out of Kennington, as it may be a foretaste (if the present system be not speedily reformed) of what we may shortly expect to see at the intended Battersea Park. But in this latter instance such proceedings would be objectionable in the extreme, for here we have a splendid piece of land soon to form a valuable addition to the various places of public recreation, and importance cannot be impressed too strongly on the Board of Works of employing men who are capable of performing the business entrusted to them, and whose arboricultural knowledge is such as will allow nothing to be purchased or planted which will not fully answer the purpose required. In the case of Kennington, we see a deplorable example of culpable ignorance and shameful squandering of public money; and I hope that you will continue to exert your influence on this point, which has already been productive of good results. *M. L. R.*

Amaryllis.—The author of "The Danubian Principalities, &c.," lately printed, in vol. i., p. 33, says that near Grobnick, in Austrian Croatia, "the scarlet Amaryllis grew on the damp soil, where tiny streamlets trickled." What does he mean? *A. H.* [Don't know.]

The Potato Crop and Spring Frosts.—In reply to the inquiry as to the kinds of Potatoes which I consider most able to resist frost, I answer, those which contain most farina. The latter always produce a much more hardy foliage than a waxy or wet Potato, and for the following reason. The mealy Potato pushes a weak, slender, tough stem, on account of the floury nature of the tuber; and in choosing Potatoes to buy for eating this is the best guide. On the contrary, if you see that the Potato is showing a strong bold eye, be sure that it will boil waxy and wet. In my experiments with the Potato I have tried all kinds of sets, but if the sorts are greened and sprouted, as described in my pamphlet, all varieties will be found to endure frost about equally well, on account of the sprouted eyes being all green, tough, and grown slowly before planting out; for be it remembered that when once this tough neck is formed it can never lose that hard consistency, neither do insects touch it. The neck of my Potatoes when dug up is so healthy and hard, that I can scarcely put a pin through it—in fact this is the grand secret in managing the Potato. Until I discovered the following plan of treating Potatoes when cut down by frost, I was as much concerned about the loss as any one. When the haulm gets cut down, as was the case everywhere this spring, it is too well known that all dormant eyes will push a large number of shoots; and if all are allowed to remain, they become over crowded, and an inferior small sized crop of tubers is the result. To remedy this, as soon as all the shoots come above ground a second time, let the work-people go over each row, and pull up all the weakest, leaving only two or three of the strongest; perhaps, upon a large scale, the hoe may do as well; once allow the main shoots the lead, and the flow of sap will be entirely directed to them. The above simple plan places the crop in as good a state as before the frost attacked it, only it is thrown 14 days later. *James Cuthill, Camberwell.*

Aëration.—Your correspondent's remarks on this subject, at page 389, are correct in principle; and, modified, the invention may be useful in certain cases. If the external air was always perfectly still, the ventilating apparatus would doubtless act with great regularity; but when a gust of wind arises, what distinction will it make between the ingress and egress openings?—almost none. It will be exactly that arising from the opposition offered by the ascending warm air to the force of the wind; and the ratio of this resistance would be something like that of a feather to a 10 lb. weight. It may, therefore, be said that the cold air, when in brisk motion, will rush in at both openings, almost indiscriminately. Your correspondent ought to prove or disprove this, and then gardeners will be able to judge of the safety or the danger of his plan. *R. T.*

Gardeners' Royal Benevolent Institution.—As a member of this charity, I was much pleased to see, by the report of the last anniversary, at p. 389, that the subscriptions amounted to 267*l.* 10*s.* Being a poor gardener, I cannot therefore refrain from returning my grateful thanks to the very kind gentlemen who so generously subscribed to its funds. But, as a member of the institution, permit me to inquire whether the gentlemen who contribute to its support do so to encourage the poor subscribing gardeners, or to render support to any gardener of the United Kingdom. If for the latter purpose, I for one cannot see the good of subscribing any longer; for if such allowance is made, it is, as it were, permitting wolves to enter freely into our fold. *A Subscriber to your Paper from the first.*

The Winter in Lancashire.—I. Plants on a Wall facing the East:—Escallonia rubra, small branches killed; E. rubra, var. viscosa, killed to the strong branches; E. pubescens, killed to the ground; Rhamnus alaternus and variety, killed to the main stem. II. Plants facing the South:—Euonymus sarmentosus and echinatus, killed to the ground; E. japonicus and variegatus, slightly killed; E. Hamiltonianus, killed to the main stem; Edwardsia grandiflora, very slightly killed; E. microphylla, the small branches killed; E. chrysophylla, killed; Viburnum rugosum, the ends of the branches killed; Ceanothus azureus, killed to the ground; C. pallidus, killed to the main stem; Solanum crispum, killed; Maclura aurantiaca, small branches killed. III. On a Wall facing the West: Buddlea globosa, small branches killed. IV. Plants in the Open Ground: Viburnum Tinus, very much cut; Bambusa falcata, cut to the ground; Aristotelia Macqui, covering a space of 8 yards, with four or five stems, 4 inches in diameter, in a very sheltered situation, killed to the ground; Arbutus Unedo, very much cut; Laurus nobilis, leaves singed as if by fire; Quercus Ilex, lost all their leaves; Rhododendrons hybridum, all more or less injured; R. ponticum, suffered in some instances; Clethras are all very much cut up. I am not prepared to say what was the lowest temperature. *Henry Shepherd, Botanic Garden, Liverpool, June 5.*—Common Rhododendrons have suffered much—some large plants are quite killed; Laurels, both common and Portugal, have suffered considerably; Sweet Bays are killed to the root; Cupressus horizontalis and Goveniana are killed. The Deodar has suffered much; Azalea indica alba, which has stood in the shrubbery for the last six years, is almost killed; Cistus cyprius is quite killed; as are also Fabiana imbricata and Erica arborea. Lavender has suffered considerably; Dielytra spectabilis has stood the winter without any protection; Calystegia pubescens, in a border against a south wall, is also coming up strongly. Yucca gloriosa has suffered much; Berberis cuneata and Forsythia viridissima have not been at all injured; Buddlea Lindleyana is killed. *H. Winwick, Warrington.*

Kitchen Garden Crops.—The following items are taken from my gardening book. Potatoes planted Dec. 9th, 1853, first drawn April 15th, 1854; Peas (Daniel O'Rourke) sown Dec. 31st, first dish picked May 20th; Potato-Onions planted Dec. 19th, sent to market June 2d. I have had about one quarter of an acre of early Potatoes, which have proved an early and good crop: I have continued drawing from April 15 up to this time. They were planted according to Mr. Cuthill's plan, only earlier, to suit our milder climate. The severe April frost visited my garden, as it was seen on Strawberry leaves close to the Potato plot; but out of the whole quarter of an acre only about 20 plants of the Potatoes were injured. As many of my neighbours who had Potatoes up had their crop seriously injured, I must attribute the escape of mine, in great measure, to their strong growth induced by Mr. Cuthill's plan, which my experience this season (a very trying one) gives me good reason to recommend. My wall fruit trees suffered no injury from the frost, nor did Strawberries, which I began to gather on the 20th of May, and which have proved an abundant crop. *P. V. R., the Lizard, June 20.*

Yew Trees.—I believe the following explanation will solve "Crayon's" difficulties. Yew foliage *is* poisonous to horses and cattle, but only causes death when taken in large quantity upon a fasting stomach. All the fatal cases which have come under my notice have taken place, as in "Crayon's" instance, during refuge from a storm, or during a ploughman's or carter's dinner under the, to them welcome, shade of a Yew tree. In all these instances the horses have been, almost to a certainty, for some time previous without other food. I myself lost a riding horse some years ago from the same cause; he was daily turned out for an hour or two into a field in which were some hedge-row Yew trees, the foliage of which he was often seen to nibble with impunity, but one unlucky day he neglected taking his usual first course of Grass, and was soon past recovery; on opening his stomach, the contents were Yew foliage, with a very trifling proportion of Grass. *Downe.*

Armenia.—Curzon's "Armenia," p. 125, describes a parasite growing on wormwood, with a flower like a Lily, 9 to 12 inches long, including the stalk, and all parts of it resembling crimson velvet. It has no leaves. Is this a fungus? He calls it Ravenea or Philipea coccinea. He also describes a kind of Thistle with flowers all up the stalk, looking and smelling like the Honeysuckle, and called Morena orientalis. Why have we not the plants of Armenia? Are our winters too naked of snow for them to be hardy? *A. H.* [The Phelipæa is a root parasite allied to Orobanche.]

Measurement of Timber.—A long calculation for this purpose was lately given by one of your correspondents, in answer, I suppose, to inquiries on that head; permit me to suggest a shorter, simpler, but equally efficacious mode of doing the same thing, being one by which, in my time, I have disposed of some hundred pounds' worth of oak timber. Let AB be the length of the timber (say 28 feet); BC the girth, or circumference at the middle of the 28 feet length (say 64 inches), then take

"Hoppus's Measurer" (the best book extant), refer to the table wherein is the exact girth of the tree, viz., one-fourth the circumference, = 16 feet, page 52; run the eye down to No. 28 in the first column, being the length of the timber, and the answer in cubic feet is given, viz., 49 feet 9 inches 4 parts; and as 40 cubic feet constitute one load of timber, we have here 1 load 9 feet. Oak timber here being about 3*l.* per load, or 4*s.* per foot square, the value of a timber Oak of the dimensions above is 9*l.* 16*s.* *W. Mason, Necton, Norfolk.*

Anacharis alsinastrum.—On my return from London a few days ago, I got out of the train at the Oxford station to gather some specimens of the Hottonia palustris (L.) which I noticed growing in a ditch close behind the building: with this plant I found abundance of the Anacharis alsinastrum. Not having heard of its appearance in that locality, I have thought it well to send you this notice, as the gradual spread of this water plant is, I know, interesting to many botanists. *Thomas Baxter, Castle Place, Worcester.*

Wasps.—We have killed in my garden 150 wasps during the last month. They were killed on the leaves of Greengage and Orleans Plums. Were all these really queens? They were very large wasps. *Cavanensis.*

Societies.

ROYAL BOTANIC, REGENT'S PARK, *June* 21.—The second exhibition of the season, held under the auspices of this Society, took place on Wednesday last. The weather, though cloudy, kept dry till about 6 o'clock, when rain began to fall, and the remainder of the evening was wet. The exhibition itself was in all respects a good one. The Queen, H.R.H. Prince Albert, and two of the Royal children, honoured it with a visit in the morning before the gates were thrown open to the public.

STOVE and GREENHOUSE PLANTS were numerous, and for the most part in excellent condition. Of groups of 16 plants, the best came from Mr. May, gr. to H. Colyer, Esq., of Dartford. It contained Ixora coccinea, two handsomely bloomed Allamandas, an Azalea and Epacris, both somewhat thin of flowers; two good Everlastings, a large Polygala cordata, the Willow-leaved Ixora, an admirable plant in the best possible condition; the ever-blooming Erica mutabilis, literally a mass of flowers; a huge Erica Cavendishi, the rosy-eyed white-flowered Vinca, and a luxuriant and finely blossomed Clerodendron fallax. Mr. Green, gr. to Sir E. Antrobus, Bart., was second. His plants, with the exception of two, perhaps, were in beautiful condition; among them were two Azaleas, still well flowered; Polygala Dalmaisiana and cordata, Rondeletia speciosa, Kalosanthes miniata and coccinea, both fine specimens and showy; Ixora coccinea, the deep chocolate-flowered Echites atropurpurea, a beautiful Erica Massoni, two Everlastings, Dracophyllum gracile, and the sweet smelling Fortune Gardenia still producing fresh flowers, but evidently very much past its best. Mr. Speed, of Edmonton, had two very good Clerodendons, Dipladenia splendens and crassinoda, both well flowered, but more especially the latter; a charming Stephanotis, Allamanda grandiflora, a small Ixora crocata, the blue Leschenaultia, a fine plant, but insufficiently in flower; a lovely Erica Cavendishi, Phænocoma prolifernm, unusually well bloomed; and Cyrtoceras reflexum. Mr. Gillham, gr. to J. R. Scott, Esq., of Leyton, contributed a beautiful group, taken as a whole; but, individually, some of the plants were past their best. Stephanotis floribunda, Schubertia graveolens, Dipladenia crassinoda, and Statice Holfordi, were all, however, finely flowered, and excellent examples of skilful cultivation, as were also two Allamandas; the Jasmine-like Rhynchospermum, Kalosanthes miniata, and the pink and white Vincas.

In collections of 12 STOVE and GREENHOUSE PLANTS, the first prize was awarded to Messrs. Fraser, of Lea Bridge Road, who furnished, among others, Allamanda cathartica, Stephanotis floribunda, Ixora coccinea, and Statice macrophylla, in excellent order; together with two Everlastings, Leschenaultia intermedia, two Polygalas, and the useful Dracophyllum gracile. Messrs. Rollisson had an admirable Erica ventricosa magnifica, which was not only one of the best plants in their groups, but one of the very best varieties of the class to which it belongs; also Erica Cavendishi; Dillwynia splendens, a bright yellow and brown flowered kind; Dipladenia crassinoda, Dracophyllum gracile, Pimelea Hendersoni, Clerodendron Kæmpferi, and Acrophyllum venosum. The last named two plants were both past their best. Mr. Clarke, of Streatham, had a charming Aphelexis sesamoides; two Leschenaultias, one (intermedia) badly coloured; a pretty little Dipladenia crassinoda, Pimelea hispida, a large Erica Cavendishi, and a Boronia serrulata, with few flowers on it.

Groups of 10 STOVE and GREENHOUSE PLANTS were furnished by Messrs. Frost, Barter, Williams, Carson, Jarvis, Hamp, and Morris. Mr. Frost had an excellent Dipladenia crassinoda, charmingly flowered; Begonia acuminata, measuring nearly 4 feet in height and as much through; but, owing to its naturally dull colour, it made little display; a well-flowered Jasmine-like Rhynchospermum; Erica Cavendishi, a good plant, but with flowers scarcely so bright in colour as they should have been; two Everlastings, Dracophyllum gracile, and Erica tricolor Wilsoni, a very large flowered kind. Mr. Barter sent an excellent Stephanotis, a huge Erica Cavendishi, Epacris miniata, Erica mutabilis, in lovely condition; Azalea præstans, thinly bloomed; Vinca rosea, Dipladenia crassinoda, and a handsome variety of Chorozema varium called elegans. From Mr. Williams (gr. to Miss Traill) came two large Cape Heaths, Azalea variegata nearly out of bloom, a charming Tetratheca verticillata, a large Pimelea decussata, Allamanda cathartica, thinly flowered; and Franciscea acuminata, in but middling condition. Mr. Carson had a lovely plant of the seldom seen Jatropha panduræfolia covered with clusters of small vivid crimson flowers; two Allamandas, an unusually well bloomed Clerodendron splendens, Lemonia spectabilis with very few blooms on it, a pretty Ixora crocata, and a good bush of Aphelexis macrantha purpurea, which is one of the best of the Everlastings. Among Mr. Jarvis' plants were Hoya campanulata, a pretty Dipladenia crassinoda, and good examples of Stephanotis floribunda and Cyrtoceras reflexum. Mr. Hamp sent a specimen of the now rarely seen but rather pretty yellow flowered Reihania squarrosa; Gardenia Fortuni, the white blossomed Xanthosia rotundifolia, Dracophyllum gracile, Clerodendron splendens, Azalea variegata—nearly out of bloom, and a somewhat thinly blossomed Allamanda cathartica. From Mr. Morris came two Allamandas, a huge Pimelea decussata, two Vincas, a Cactus, and an Everlasting.

Collections of six STOVE and GREENHOUSE PLANTS came from Messrs. Taylor, Rhodes, Over, and Roser. In these groups we remarked Ixora crocata, Eriostemon buxifolium, Aphelexis spectabilis, Pimelea Henderson, Leschenaultia formosa, Stephanotis floribunda, Dipladenia crassinoda, Cyrtoceras reflexum, Epacris miniata, various Cape Heaths, Sollya linearis, and Polygala oppositifolia.

IXORAS were furnished by Messrs. Over, May (gr. to H. Colyer, Esq.), and Hamp. The species were javanica, crocata, coccinea, and salicifolia.

Mr. Green had a group of tall Cacti, the varieties in which did not appear to differ from those produced by the same grower at the last exhibition at Chiswick.

ORCHIDS were more numerous and in better condition than they were at this Society's last show. In groups of 20 plants, Mr. Williams, gr. to C. B. Warner, Esq., was first. He had a beautiful specimen of Calanthe masuca in excellent condition; a very finely-flowered Aerides odoratum majus, Epidendrum verrucosum, Saccolabium guttatum, with some 10 charming racemes of flowers; Cypripedium Lowi, Vanda suavis and insignis, and Phalænopsis grandiflora. Mr. Woolly, gr. to H. B. Ker, Esq., had an interesting group, in which the most remarkable plants were Dendrobium Devonianum; Paxtoni, and transparens; Saccolabium guttatum, a fine plant of Phaius albus, and an unusually well-bloomed Peristeria elata. From Mr. Blake, gr. to J. H. Schröder, Esq., came three large and finely-bloomed plants of different kinds of Aerides, Saccolabium guttatum, Dendrobium formosum, a profusely-flowered Cypripedium barbatum, Calanthe veratrifolia, and Phaius Wallichi.

Of groups of 12 ORCHIDS, the best came from Mr. Hume, gr. to R. Hanbury, Esq., the Poles, Hertfordshire. The tops of the pots in this collection were tastefully mossed over, and even stumps of trees, on which were growing Vanda teres and Phalænopsis grandiflora, were covered over with the same material; both these plants were unusually well flowered, more especially the latter, which was the admiration of everybody. Two large and very fine Aerides were growing in square wire baskets, and there was a good plant of Coryanthes maculata with two of its singular blossoms. Cattleya citrina had three blooms on it, and there was also a good Cattleya intermedia, together with Oncidium luridum guttatum, Saccolabium Blumei, and the rare Dendrobium Dalhousieanum. Mr. Carson, who was second, contributed Dendrobium Farmeri in lovely condition, the small purple flowered D. aduncum, Angræcum caudatum, two good plants of different kinds of Aerides, a very dark coloured variety of Cypripedium barbatum, and a good specimen of Dendrobium nobile. From Mr. Gedney, gr. to Mrs. Ellis, of Hoddesdon, came a fine plant of one of the varieties of Aerides odoratum, two charming examples of Phalænopsis, the seldom seen Galeandra Funcki, with greenish yellow flowers, stained at the point of the lip with purple; Sobralia macrantha, Phaius albus, and Epidendrum verrucosum. Mr. Clark, gr. to Mrs. Webb, produced small plants of Oncidium stramineum, a neat Saccolabium guttatum, a highly coloured and beautiful Sobralia macrantha, Cattleya Mossiæ, three Oncids, and as many kinds of Aerides.

Of collections of 6 ORCHIDS there were several. The best came from Mr. Green; it contained very fine specimens of Aerides odoratum, Oncidium Lanceanum, Dendrobium nobile, Stanhopea tigrina, with two flowers on it, and a small Barkeria spectabilis. Mr. Iveson contributed a strong growing Vanda tricolor, with two bunches of flowers on it, Odontoglossum hastatum, Oncidium ampliatum majus, with two spikes of showy flowers; Aerides odoratum, low and spreading, but well bloomed; Cattleya Forbesi, and Saccolabium guttatum. Six small plants were also communicated by Mr. Summerfield and Mr. Jarvis. Mr. Iveson had a most beautiful variety of Cattleya Mossiæ, with pure white sepals and petals, and a purple tipped lip.

ROSES in pots, with the exception of those from Messrs. Lane, were not near so fine as we have seen them on former occasions. Messrs. Lane had finely bloomed specimens of the well known Coupé de Hébe, Paul Perras, Duchess of Sutherland, Chenêdolé, Great Western, Louise Peronny, and Magna rosea. The last is a beautiful Rose, delicate pink in colour, with a rosy centre. Great Western is seldom to be found good, but when it is, it is certainly a valuable variety. Among Mr. Francis' plants we observed Madame Plantier, Chenêdolé, Coupé de Hebé, Richelieu, and Juno, the last a first class sort, which all must admire. Adam and Souvenir de la Malmaison in Mr. Rowland's group (to which the first prize was awarded in the amateurs' class), were both good examples of these favourite kinds. Cut Roses were numerous, and commanded, as they always do, a large share of attention. Of boxes of 50 sorts the best came from Messrs. Paul, of 25 varieties from Mr. Rowland, and of 24 kinds from Mr. Terry.

CAPE HEATHS were contributed in good condition by Messrs. Fraser, Rollisson, Clarke, May, Williams, Roser, Taylor, Over, Jarvis, and Rhodes. Among the different varieties were tricolor Wilsoni and other sorts belonging to this class; metulæflora, dentculata moschata, depressa, ventricosa grandiflora (a fine kind), Cavendishi, Bergiana, Halicacaba, ampullacea vittata, Westphalingia, mutabilis, Massoni, perspicua nana, gemmifera, and tortiliflora.

Of plants having fine foliage, M. Van Houtte, of Ghent, contributed Passiflora marmorea; a small example of a Japan Acer, with reddish foliage; Bilbergia Carolinæ, the bases of whose inner leaves, *i. e.*, those in the centre of the plant, are brilliant crimson; Aphelandra Leopoldi, with beautifully white-veined foliage; an Achimenes, Begonia xanthina marmorea, and B. x. Gandavensis, the former with large leaves, having silvery markings; Reseda microphylla (in this instance scentless), and Canna liliiflora.

Of novelty there was little. Mr. Hume, gr. to R. Hanbury, Esq., had a yellow-flowered terrestrial Orchid, a Eulophia-like plant, from Natal; Mr. Frost, a Begonia, which was stated to be an improvement on Prestoniensis; Messrs. Standish and Noble a large and fine bloom of Clematis lanuginosa, and a plant of C. l. pallida, both fine kinds, from the north of China, and supposed to be hardy; Messrs. Osborn had Lysimachia Leschenaulti, a promising plant; Messrs. Henderson, Pine Apple Place, a white Gompholobium (G. album) whose flowers are, however, pale straw or cream-coloured, not white; and Messrs. Henderson, of the Wellington Road, the yellow Aphelandra squarrosa.

Of FERNS, both exotic and British, there were fine collections from Messrs. Fletcher, Woolley, Gedney, Allchin, Williams, and Smith. Messrs. Standish and Noble had also Lomaria chilensis, a supposed hardy kind. In one of the collections of British sorts we remarked the rare Gymnogramma leptophylla, which was recently discovered in Jersey, and of which some account was given in a former volume.

MISCELLANEOUS subjects consisted of Berberis japonica, Beali, and intermedia; Lilium sinicum, and Embothrium lanceolatum from Messrs. Standish and Noble; Hæmanthus Rooperi, from Mr. Epps; Gordonia javanica, from Messrs. Fraser; a flowering top of Rhododendron javanicum, from Messrs. Lane; a plant of the Rhododendron called John Waterer, from Messrs. Waterer's, of Bagshot; and boxes of Irises and Pæonies, from Mr. Salter, of Hammersmith.

PELARGONIUMS were plentiful, and made a good display. In the class of 12 plants, Mr. Turner was first, with Majestic, Magnet, Ganymede, Topsy, Beatrice, Optimum, Enchantress, Rowena, Splendidum, Juliet, Virgin Queen, and Exactum; 2d, Mr. Dobson, with Ambassador, Arethusa, Harriet, Mont Blanc, Exhibitor, Star, Diadem, Ajax, Rosamond, Vulcan, Delicatum, Neatness; 3d, Mr. Gaines; 4th, Mr. Clark. In the Amateur Class of 10 plants, Mr. Nye, gr. to E. Foster, Esq., was first, with Autocrat, Sunrise, Purple Perfection, Optimum, Ariel, Enchantress, Magnet, Cloth of Gold, Attraction, and Phaeton; 2d, Mr. Holden, gr. to the Rev. E. Coleridge, with Carlos, Pearl, Magnificent, Portia, Mochanna, Norah, Enchantress, Claudiana, Star, and Centurion; 3d, Mr. Robinson, Pimlico; 4th, Mr. Wier, gr. to G. Hodgson, Esq., Hampstead.

Of FANCY PELARGONIUMS there were not so many as usual. Mr. Turner was first with Barbette, Celestial, Perfection, Gaiety, Madame Rosati, and Delicatum; 2d, Mr. Gaines, with Advancer, Clarnevilla, Fairy Queen, Delicatum, Princess Marie Galitzin, and Madame Ugald. In the Amateurs' Collections, Mr. Robinson was first with Cassandra, Celestial, Magnum bonum, Cobden, Fairy Queen, and Princess Marie Galitzin; 2d, Mr. Winsor, gr. to A. Blyth, Esq., Hampstead; 3d, Mr. Wier, gr. to G. Hodgson, Esq., Hampstead; 4th, Mr. Barter, gr. to A. Bassett, Esq., Stamford Hill. A prize was awarded to Mr. Gaines, for his French varieties.

In the class of NEW PELARGONIUMS, 6 plants, the first prize was awarded to Mr. Turner, for Sanspareil, Optimum, Zarea, Mary, Majestic, and Leonora. Mr. Dobson had a boxful of cut blooms, among which were many very fine varieties.

FUCHSIAS were shown in excellent condition by Mr. Bray, of Regent's Park. His varieties were Perfection, Nonsuch, Elizabeth, Princess, Collegian, and Madame Sontag; 2d, Mr. Ward, Regent's Park, with good plants; but disfigured by the conspicuous display of strings of bast, with which their branches were tied in their places.

CALCEOLARIAS.—Mr. Stone, of Hull, sent some very fine herbaceous varieties, the best of which were Celestial, Truth, Rising Sun, Teetotaller, and Mary Ann. Some half-shrubby varieties were also furnished by Mr. E. G. Henderson, of Wellington Road. Of these the best were Aurora and crocea.

VERBENAS.—Some were shown by Mr. Smith, of Hornsey, among which Rival and Triumph were good striking kinds.

Some good PINKS were exhibited. In the Amateurs' Class, the first prize was awarded to Mr. Baker, Woolwich, for blooms of Huntsman, Sarah, Ruby, Colchester Cardinal, Favourite, Arthur, Mrs. Norman, Koh-i-noor, Winchester Rival, Sappho, Kate, and a seedling. In the class of 24 blooms for Nurserymen, Mr. Turner was 1st, with New Criterion, Perfection, President, Narborough Buck, Rubens, Beauty of Salt Hill, Charmer, Adonis, Pandora, Mr. Hobbs, Fanny, Sappho, Ada, Ruby, Sarah, Jupiter, Portia, Arthur, Edgar, Prince Albert, Great Criterion, King of Purples, Glory, and Mrs. Maclean; 2d, Mr. Bragg, of Slough.

PANSIES, 24 blooms.—1st, Mr Holder, gr. to Rev. E. Coleridge; 2d, Mr. James, gr. to W. F. Watson, Esq., Isleworth. 36 blooms, Nurserymen, 1st, Mr. Turner; 2d, Mr. Bragg; 3d, Mr. Bryan, Hounslow. Among these we remarked specimens of Comet, Earl Mansfield, Royal Albert, Emperor, Miss Stewart, Egon, Miss Talbot, Absalom, Father Gavazzi, Ringleader, Samson, and Mrs. Marnock.

SEEDLINGS.—Certificates were awarded to the following: Pelargonium Enchantress; this was exhibited by Mr. Halley,

Blackheath—it is a finely shaped fancy kind, with a good colour; Pelargoniums Phaeton, Laura, and Vesper, all of which have been described before. Pansy, Mr. Phillips, exhibited by Mr. Bragg. The prize for the best scarlet Pelargonium was awarded to Mr. Gaines, for Conqueror.

Of FRUIT, which was shown in the conservatory, there was a fair display; but owing to the crowded state of the place, we only found opportunity to notice some of the best of it. There were 3 miscellaneous collections, 6 Providence Pine-apples, 9 Queens, besides one or two other sorts; 30 green-fleshed and 8 scarlet-fleshed Melons, 27 dishes of Black Hamburgh Grapes, besides 8 trays of 12 lbs. each; 4 dishes of West's St. Peter's, 5 of Sweetwater and Muscadines, 6 of Muscats, 5 of Frontignans, and 1 of Judson's Richmond Villa; 25 dishes of Peaches, and 16 of Nectarines; 4 of Figs, 3 of black Cherries and 4 of white, and 42 exhibitions of Strawberries.

The best collection of FRUIT came from Mr. M'Ewen, gr. to the Duke of Norfolk, at Arundel. It contained 2 dishes of Black Hamburgh Grapes, 3 Queen Pine-apples, the heaviest of which weighed 4 lbs.; May-duke Cherries, 2 dishes of Royal George Peaches, and Elruge Nectarines; 4 dishes of Strawberries, consisting of Eleanor, British Queen, Victoria, and a dark-coloured French sort called La Liégeoise; and 3 Melons, viz., Bromham Hall and Golden Drop.

PINE-APPLES.—The best Queen by far was produced by Mr. James, gr., Pontypool Park. It was beautifully formed, quite ripe, and weighed 5 lbs. 1 oz. Mr. Jones and Mr. Dods, also, both had good fruits of this variety. Providences were, for the most part, but indifferently shaped. The best came from Mr. Collinson, Eaton Hall; and good fruit, though light, came from Mr. Robinson, gr. to Lord Boston, Mr. Bailey, and Mr. Hamp. Mr. Turnbull and Mr. Davis also showed Pine-apples.

GRAPES.—The best tray of 12 lbs. Black Hamburgh was furnished by Mr. Frost, gr. to E. L. Betts, Esq.; and the same exhibitor also deservedly obtained the first prize for three bunches of the same variety. Mr. Henderson, Mr. Forbes, Mr. Mitchell, Mr. Spary, and Mr. Harrison likewise had excellent exhibitions of this sort. The best bunches of Black Prince came from Mr. Bore, of Springfield, Mr. Lushey, and Mr. Constantine. White Muscadines were furnished in excellent condition by Mr. Bailey, Mr. Williams, and Mr. Busby; Muscats by Mr. Turnbull, Mr. Forbes, and Mr. Forsyth; and Frontignans by Mr. Henderson, and Mr. Bain.

PEACHES AND NECTARINES.—From Mr. Collinson came a beautiful dish of Royal George, and Mr. Snow had equally fine specimens of Noblesse. Mr. Wright, Mr. Forbes, Mr. Chapman, and Mr. Ruffet had also fine dishes—the last-named sending Grosse Mignonne. Mr. Evans had beautiful Violette Hâtive Nectarines, and excellent examples of Elruge came from Mr. Chapman, gr. to J. B. Glegg, Esq. Mr. Henderson, Mr. Abbott, Mr. Tegg, and Mr. Bore, also all showed good dishes of this kind of fruit.

Of FIGS the best were Mr. Constantine's examples of Nerii, and Brown Turkey came from Mr. Collinson and Mr. Iveson.

CHERRIES.—Of black kinds the best was a beautiful punnet of Circassian from Mr. Snow; and another of Elton, from the same grower, also obtained the first prize in the class of white sorts. Mr. Mitchell, of Brighton, showed good fruit in both classes.

The best STRAWBERRIES came from Mr. M'Ewen. They consisted of British Queen and Eleanor. Mr. Reid, of Sydenham, also showed good fruit in this class.

MELONS.—Mr. Chapman, gr. to J. B. Glegg, Esq., obtained the first prize for a green-fleshed kind, and Mr. May, gr. to H. Colyer, Esq., sent the best scarlet fleshed. Mr. Monro and Mr. Jupp also each sent good Melons.

Messrs. Lane showed some dwarf standard Cherry and white Currant trees in pots, both extremely well fruited for their size.

CHELTENHAM HORTICULTURAL EXHIBITION.—It is a source of gratification to observe the yearly improvement in the management and success of provincial horticultural exhibitions. A few years since they were almost invariably got up and managed by interested parties; *i. e.*, by proposing exhibitors, whose object was not the advancement of horticulture, and the collateral arts and sciences connected with it, but to so arrange the prize and censor lists as to ensure to themselves the lion's share of the awards. As a natural consequence of such injudicious management, societies of the kind have always proved very ephemeral; and considering the little good and the large amount of bad feeling they engendered, such a result was little to be regretted. In some few instances, however, a different end has been aimed at. Perhaps no provincial exhibitions have equalled (certainly none have surpassed) those of Cheltenham. Not contented with throwing them open to the United Kingdom, they have opened them to all the world; and, by offering liberal prizes, encourage competition, and make it worth while for first-rate growers to bring their productions from a distance. An exhibition took place at Cheltenham on Tuesday and Wednesday last, which would have done no discredit to London. The stove and greenhouse plants were numerous and fine; Heaths good; Orchids choice, healthy, well grown, and in respectable quantity; and of plants with ornamental foliage there was quite a legion. The only drawback was in the Pelargoniums, which, though abundant in quantity, were, with one or two exceptions, very poor and ill-grown. On the first day, the plants were exhibited in the usual way, classed according to their kinds; but, on the second, a new feature was tried, which was evidently a step in the right direction. The plants were all rearranged, each exhibitor's in one great mass by themselves. Prizes were offered in five classes, and the exhibitors had the option of showing their plants in any one of the classes they pleased. The appearance of some of the groups, which were tastefully arranged, was very good; and we observed some very happy effects produced by combinations of Orchids with Pelargoniums, and the judicious admixture therewith of Ferns and other ornamental-leaved plants. The exhibition took place in the grounds of the old Wells, which, besides a very handsome and well-stored museum, contains, as an additional attraction for the season, a crystal palace on a small scale, containing a very nice little exposition of arts and manufactures. All together, a spirit quite up to the present day has been displayed by the inhabitants of Cheltenham. We recommend their doings as an example to other towns, and in their future trials heartily wish them success. *W. D.*

Notices of Books.

Handbooks to the Crystal Palace. Bradbury & Evans.

THIS series consists of seventeen duodecimo volumes, remarkably well got up by the gentlemen connected with the building, skilfully illustrated by excellent woodcuts, and admirably printed. They vary in price from 1*s.* to 3*d.*, and furnish a complete guide to the palace and grounds. One of them, written by Mr. Phillips, and illustrated by Mr. Philip de la Motte, is a condensation of the others, with additions, but by no means a substitute for them. We have so frequently described the garden and its decorations, with which alone this journal has to deal, that little remains to be said, except that, in Mr. Phillips' volume, are very clever views of what the scenery will become, when the works shall have been completed.

Russia, the People, Country, and Government; Turkey, the People, &c.—by G. T. Horton, each with 30 illustrations (Mason & Co)—form a pair of well printed volumes upon the countries whose name they bear, treating concisely of their history, religion, climate, commerce, and defences. The woodcuts are very cleverly executed, especially a full-length portrait of the Sultan.

FLORICULTURE.

THE RANUNCULUS is admitted to be the *ne plus ultra* of floral perfection, and yet it is a singular fact that its culture is all but neglected by florists in general. Let us hope, however, that its present limited cultivation may soon be extended, and that all may become more familiar with its appearance. Few flowers can be grown in so limited a space and with so small an annual cost; and when in bloom what surpasses it in beauty! Among southern growers, Messrs. Tyso, Costar, Airzee, Reeves, and Hook stand prominent; but these are not enough, and our midland florists seem to be quite as neglectful of its culture as our metropolitan friends. I trust that these remarks may be the means of inducing a few new growers to enter the field; and with a view to accelerate this desideratum, I venture to point out to the uninitiated the best modes of cultivation, and which are to be found in Tyso's little treatise on this flower. I have carried out the following instructions as to soil, formation of beds, and planting, fully, and with such excellent success, that I feel convinced the drawing attention to them here even thus early in the season will be doing a real service. "The foundation of all good culture is the adaptation of the compost to the natural habitats of the plant. Experience teaches that the Ranunculus delights in a rich hazelly loam. If, therefore, the natural soil of the garden be unfavourable, procure the top spit of a pasture, of rather heavy and tenacious but not clayey qualities, with the turf, and lay it in a ridge some months, and turn it two or three times before use. To give precise and accurate directions in print for selecting a suitable soil is difficult, but it is deserving of remark, that a pasture abounding with, and luxuriantly sustaining the British varieties of Ranunculuses, or Butter-cups, as they are usually called, has also been found congenial to the Asiatic species. The addition of fertilising agents to maiden soil is of paramount importance. Many composts have been recommended to the amateur, the proportionate ingredients of which have been prescribed with the precision of a physician's formula. The secret of vigorous foliage and enormous blooms has been a mixture of powerful chemical stimulants, or a substratum of cow-dung a foot thick, or some other equally unnatural process. Our advice is to avoid quackery. Many valuable collections have been ruined by excessive applications of suitable manures, or the use of such as are destructive rather than nutritive. Decayed stable and cow-dung, in equal quantities, constituting together about one-third, added to two-thirds of loam, will, when mixed and thoroughly incorporated, form a compost for the main depth of the bed; reserving a portion of loam sufficient to make a top layer of soil 2 inches deep, to which about half the above-stated proportions of well decomposed manure may be added. It is of importance that the tubers should not be placed in contact with fresh manure, as it engenders disease in the roots, and consequent injury to the plants. Having chosen an open but not exposed part of the garden, which will admit of the beds being laid down about east and west, remove the earth a foot deep, and from 3 feet to 3 feet 4 inches wide, and fill the bed with the prepared compost, to within 2 inches of the surface; leave it thus a month, and then add the reserved top soil. These operations are best done in autumn, that time may be allowed for the earth to settle. The surface of the beds should be level, and not more than an inch higher than the paths, in order that the roots may be kept regularly cool and moist; and as the Ranunculus thrives on a firm bottom, the compost should not be disturbed at the time of planting, more than is just needful for that operation. During winter the surface may be pointed up rough to take the benefit of frosts, but in no case should this be done more than 2 inches deep. The beds may be neatly edged with inch boards painted lead colour, and in case named sorts are planted, should be numbered with white paint to correspond with the numbers entered in the amateur's list. As a bed, well constructed at the commencement, will admit of several successive plantings with an annual addition of fertilising materials, it is worthy of the particular care of the cultivator, though the preparation at first may involve some little trouble and expense. The best season for general planting is the last fortnight in February—the plants have not then to contend with the severities of the winter. In some favourable seasons roots may be planted with advantage in October; they will have more time to vegetate, and establish themselves; will make stronger plants, and will bloom more vigorously, and about a fortnight earlier than if planted in spring. Considerable hazard, however, attends autumn planting, and it is not recommended, except by way of experiment, to those who possess a large stock and can afford to risk a portion. In fine weather, towards the close of February, rake your beds perfectly level, and divide them into six longitudinal rows for mixed roots, allowing 4 inches from the outside row to the edge; or for named sorts, mark your rows transversely at distances of 5 inches asunder, and plant six roots in a transverse row. Draw drills one inch and a half deep, and plant the roots with the claws downwards, with a gentle pressure to secure them in the soil, so as to be one inch and a half from the crowns to the surface. When planting on a small scale a dibble with a shoulder at the precise depth may be used, but in large quantities it is an inconvenient method; and planting at the bottom of a drill with slight pressure, and without disturbing the subsoil, is attended with similar advantages to the use of a dibble, and in practice will be found to have some points of preference. If the top soil is light after planting, it may be gently beaten with the back of a spade; this operation, however, must be only done in dry weather." *C.*

Miscellaneous.

CORRESPONDENCE BETWEEN LORD JOHN RUSSELL AND MR. KENNEDY.

25, Lowndes Square, 5th June, 1854.

MY LORD,—I am induced to address this letter to your lordship at the present time, from two considerations—1st, You are Leader of the House of Commons; 2d, It was to you, to whom I have been intimately known throughout my life, that I owed my appointment as Commissioner of Woods, Forests, and Land Revenue of the Crown. You were also a member of Lord Melbourne's Government in 1837, when he was pleased to appoint me to the office of Paymaster of Civil Services in Ireland, an office created at that time, and substituted for the ancient Treasury and Exchequer, and I was selected as a person qualified to introduce a new system in financial affairs in that country. At the close of 10 years' service, a letter was addressed to me by command of the Lords Commissioners of her Majesty's Treasury, bearing date April 3, 1847, transmitting to me a Treasury minute of March 30, of both of which documents I beg leave to annex copies for your lordship's information, respecting the manner in which I was considered to have performed my duties.

From the office of Paymaster of Civil Services, it was proposed to me by your lordship, that I should be transferred in the autumn of 1850, to the Department of Woods, Forests, and Land Revenue, for the purpose, as I believe, and cannot doubt, of assisting to introduce an improved system of management with regard to the property of the Crown, which in many most important particulars had been notoriously mismanaged and neglected, and which in public estimation loudly called for amendment. This view is fully and emphatically confirmed by the language of her Majesty's speech from the throne, on August 8, 1851, when her Majesty was graciously pleased to state that, "I have willingly given my consent to a bill relating to the administration of the Land Revenues of the Crown, which will, I hope, conduce to the better management of that department, and at the same time tend to the promotion of works of public utility."

Your lordship is aware that very recently a letter was addressed to me by the Chancellor of the Exchequer, dated April 29, informing me, "that after what has taken place it is plainly impossible that the affairs of the department can remain in your hands with advantage to the service of the Crown and of the public," which decision has been subsequently confirmed by a Treasury minute, bearing date May 10, 1854, going at large into the subject (but omitting a letter which I addressed on May 2 to the Earl of Aberdeen), and to which minute I beg leave to refer your lordship. This minute makes a temporary arrangement for the transaction of the business previously performed by me, but my patent of appointment remains at the present time unrevoked, and can be cancelled, I apprehend, only by the issue of a fresh commission, which has not yet taken place.

When I received the Chancellor of the Exchequer's letter of April 29, I had no reason to doubt that the decision which the Chancellor of the Exchequer announced to me in it, was also the decision of the Government, and I treated it as such, but on May 2 I felt it to be necessary to address a letter to the Earl of Aberdeen, as First Lord of the Treasury and Prime Minister; and when I received his lordship's reply, dated the 9th, informing me, "that not having been informed of the circumstances to which you advert, I felt it incumbent upon me, before expressing any opinion, to examine the voluminous documents explanatory of the case;"—I, for the first time, became aware that Mr. Gladstone's decision was not the act of Government, but of the Chancellor of the Exchequer individually.

As Lord Aberdeen had not been consulted, so I take for granted that your lordship equally, was at the time uninformed, and in ignorance of the decided step taken by the Chancellor of the Exchequer, your colleague in the administration, with respect to an individual whom you, as Prime Minister in 1850, appointed to the office, from which he was removed by the act of the Chancellor of the Exchequer alone. Whether, if I had been aware, from the first, of all these circumstances, I should have taken all the steps I did take, I will not now stop to discuss; but the moment I received the letter of dismissal I could not help feeling indignant at the hasty injustice with which I was treated, and I was anxious (as I had been during the whole of the past year), that my management of the department entrusted to me, and also the causes and justification of my dismissal from the public service, should be inquired into.

Both these subjects are no doubt of great public importance, but the latter partakes of a private and personal character, involving, as the Treasury minute of March 31 *unwarrantably* states, my "veracity, integrity, and honour," as a public servant.

For the investigation of the first subject, a notice of motion for a committee has been kept floating on the Notice Book of the House of Commons during almost the whole of the present Session of Parliament, manifestly in a spirit of inculpation as affecting my management, and the terms of the motion have been somewhat singular, restricting the objects of the committee to "present" management, thereby excluding "past" management (or mismanagement as the case might be), and thus excluding a fair inquiry into the *present*, which must necessarily depend on the *past*; and I have been informed, and should suppose correctly, that the Treasury consented to this committee, on the condition of controlling in a great degree the nomination of its members.

But for the investigation of the second, and personal question, a different tribunal seems in fairness to be required, as contra-distinguished from a committee originating in disapprobation of my administration of the Royal Forests; and from the last letter which I have received from the Treasury, of which a copy is annexed, I cannot help believing that your lordship, as Leader of the House of Commons, will at once see the justice of granting, *as an unopposed motion*, the appointment of an impartially chosen and select committee, *to be named by the Committee of Selection* In the justice and fairness of the Committee of Selection I should have entire reliance.

I beg leave thus briefly to state to your lordship that my object is to free my public character from the imputations cast, as I think most unjustly, but with much dexterity upon it, a dexterity which is entirely unsupported by the facts of the case, and to show to an impartially-chosen tribunal of high-minded gentlemen, that my "veracity, integrity, and honour" are in no way involved or implicated, as has been unscrupulously asserted in the Treasury minute of March 31.

A signal instance of the manner in which I have been treated as regards the administration of the affairs for which I was responsible, is made manifest in a case in the department of the Land Revenue in Ireland, which relates to the Crown's estate of Kilconcouse, in the King's County, where Mr. Wilson, at the instance of Mr. Sadleir, and, I apprehend, without the knowledge of a single Cabinet Minister, reversed by an act of authority, as I think unjustifiably, a course of proceeding which I considered the public service (and set forth in public documents) imperatively to require, and which I, as the responsible administrator, after personal consultation with the Lord Lieutenant of Ireland, had deliberately pursued. It was first sought to accomplish this object by verbal communication with me, which would have left no trace behind, but I declined to make myself responsible for an act which I strongly disapproved. *The command*, however, was eventually issued, and instantly obeyed by me, and because I had not submitted to perform an act of subservience in this matter, I felt ever after that the displeasure of the Treasury was visited upon me, and so it has been ever since.

I could say much more, but will beg leave to refer your lordship to a statement more at large, which I am about to make public, and trust that, in the meantime, your lordship, as Leader of the House of Commons, may see fit to intimate to me that a Committee will be conceded forthwith, to be nominated by the Committee of Selection, to enter on an impartial investigation of the grounds of my dismissal from office. I undertake to show before such a tribunal, that, under colour of an inquiry, an act of enormous injustice has been committed, by means wholly subversive of the principles on which justice and law are administered in this country.—I have the honour to be, my lord, with great respect and regard, your lordship's obedient humble servant,

(Signed) T. F. KENNEDY.

The Right Hon. Lord John Russell.

Chesham Place, June 9, 1854.

SIR,—It is with much regret that I contemplate the circumstances, only partially known to me, which have led to your separation from the public service. The high character you bear for integrity and honour, the long and useful career which you have pursued in the service of the Crown, and the zeal for the reform of abuses which distinguishes you, make it a matter of deep concern to me that you should no longer be in charge of the department hitherto entrusted to you.

Not having at this moment a seat in the House of Commons, I cannot give you an answer as to the course which I may think it my duty to pursue in reference to Parliamentary enquiry; but should I be re-elected, I shall be ready to communicate with any member who may move for a committee upon this painful subject. —I remain, sir, your most obedient servant,

(Signed) J. RUSSELL.

The Right Hon. T. F. Kennedy.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—At no season should the plants be crowded in this house, and this is especially to be avoided at the present, when mildew is unusually active, and most things in such a state as to be speedily injured by it. Endeavour to grow every plant well, and to bring nothing but fair specimens here, and then there will be no temptation to huddle them together for the purpose of making the one hide the defects of the other. In the case of soft-wooded stove plants, or such things as are grown in a season, it is not of much consequence if they receive a little injury by being placed close while in bloom, but all valuable specimens of hard-wooded plants should stand quite clear, so that every part may receive plenty of light and air. Indeed most conservatories are so constructed and managed as to be very unsuitable for many of our finest summer-blooming greenhouse hard-wooded plants, as Ericas, Leschenaultias, &c.; and if these must be brought here they should while in flower be placed near the glass in the coolest part of the house, where air can be freely admitted during the day; and a little left on at night, when the weather is warm, will greatly assist in preventing etiolation. And such things as are known to be impatient of a confined atmosphere should on no account be allowed to remain too long in a situation which is at the least unsuitable; for fine specimens are not grown without much time and care, and many of them do not soon, if ever, get over an injury which at the time, save to the practised eye, may be hardly perceptible. The Camellias and Azaleas for early flowering will have set their buds, and should be removed to a sheltered shady situation out doors; for if kept in heat they will be apt to make a second growth, which must be avoided, as it prevents their flowering so freely as would otherwise be the case. Give every possible attention to plants for autumn and early winter flowering, as Lilium lancifolium, Chrysanthemums, Salvia splendens, Globe Amaranths, Tree Carnations, Scarlet Geraniums, Cinerarias, Gesneras, Begonias, Euphorbias, &c. Let these have plenty of pot room, good rich compost, a moist atmosphere, and plenty of space for the perfect development of their foliage, regulating the temperature according to the nature of the plant, and they will make very rapid progress. Selago distans is an exceedingly useful winter flowering plant, requiring merely a cold pit to grow it, and flowering through a long season. But we have nothing that surpasses the Epacris, the winter-blooming Ericas, and the Cytisus, and these should not be overlooked in the crowd of suitables. Among comparatively new plants, Sericographis Ghiesbreghtiana is a really good thing for the decoration of the conservatory in winter, as also the blue Conoclinium, and the singular looking Thyrsacanthus rutillans is first-rate for a rather warm house; but I have not found it to answer for winter use in the conservatory. The atmosphere of plant houses can hardly be kept too moist at this season, but it is very easy to err in the opposite direction; therefore sprinkle every available surface frequently, and syringe growing stock lightly twice a day during bright weather, Avoid a too free use of the shading, and ventilate freely, in order to secure compact growth.

FORCING DEPARTMENT.

PINERY.—In case of its being found necessary to add fresh tan to prevent a decline of the bottom heat, it will, in most cases, be safer to surface with a few inches, which should be in a rather dry state, than to mix it with the old tan, which might cause too strong a heat, and occasion much trouble. There is much greater danger from too much than too little bottom heat at this season; therefore, keep a sharp watch upon beds that have been recently disturbed, and avoid the possibility of burning the roots. Encourage plants swelling their fruit with a high temperature, a moist atmosphere, and plenty of manure water at the root; and keep the fruit in an upright position. Young growing stock must not be allowed to stand too closely, but should be afforded plenty of space for the perfect development of their foliage, and kept near the glass, to induce stocky growth. A slight shade on the forenoons of bright days will be useful, but this should be used sparingly, allowing the plants all the sun they will bear without the leaves getting discoloured; except where the bottom-heat is supplied by the fire, this need be used but very sparingly for the next three months, for by shutting up early in the afternoon after syringing and giving the plants a good steaming every sunny afternoon, they will make rapid growth without the aid of fire-heat, save on dull cloudy days, or unseasonably cold nights. VINERIES.—Keep a sharp look-out for spider, and where plants are grown under the Vines, for black thrips also, and spare no pains to keep the foliage in perfect health, for if the leaves are allowed to get injured before they have performed their part, the economy of the Vine will be deranged, and the mischief will be perceptible on next season's crop. The laterals need not be kept so closely stopped after the fruit is ripe, but they should not be allowed to interfere with or shade the principal leaves. After the fruit is cut the house should be kept more moist, giving the Vines a good washing with the engine if red spider is at all troublesome; but air should be admitted freely, keeping the atmosphere as cool as can conveniently be done. Recently planted Vines should be encouraged to ramble away freely, and the laterals should not be stopped too closely, as the more leaves they are allowed to make the more freely the roots will run in the border, and this is what is chiefly wanted the first season. PEACHES.—Maintain a moist healthy atmosphere while the fruit is swelling. Syringe and shut up early in the afternoon, but give air sufficiently early in the morning to prevent any risk of scorching the foliage. Keep the inside borders well supplied with water, giving manure water to trees bearing a heavy crop, and see that the soil is thoroughly moistened to the bottom of the border. Give every attention to the preservation of the foliage in houses where the fruit has been gathered, keeping the atmosphere cool and moist, and giving the trees an occasional washing with the engine, to keep red spider in check and the leaves clean.

FLOWER GARDEN AND SHRUBBERIES.

Now that the bedding stock is fairly cleared off, and growing freely in their summer quarters, there will be more space and time to attend to the propagation of favourite hardy plants, and no time should be lost in getting in a good supply of cuttings of such things as it may be thought desirable to increase; for the propagation of the bedding out stock for next season will soon require attention. If not already done, sow Brompton and Queen Stocks for spring flowering, selecting for them a bit of light rich soil, and never letting the surface become dry until the plants are well above ground, for there is no time to be lost if these are to be had strong for blooming next May, and at that season we have nothing more beautiful nor half so fragrant as well-grown plants of the latter. Do not omit to put on a slight hotbed a good stock of Pink pipings; and also see that there are plenty of young plants of Pansies for enlivening the borders next spring. These have hitherto been left too much in the hands of the florists, but they are deserving of extensive cultivation for the spring decoration of the flower garden. Young shoots, where they can be procured, will root freely under a hand-glass in a shady situation, and if planted out in rich soil in a shady corner, will grow rapidly during the autumn, and may be transplanted into the flower garden, when the frost cuts off its present occupants. Cuttings of Roses grown under glass root in a gentle bottom-heat almost as freely as Verbenas; and every cutting which can be procured should be got in at once, for it is hardly possible to be overstocked with these. Persevere with mowing, rolling, &c. Keep down weeds, and let neatness prevail everywhere.

FLORISTS' FLOWERS.

PINKS will now demand extra care; in the north they are a fortnight later than with us. Those buds which have been retained should be examined every morning and tied round with a piece of thread, which has been rubbed with bees'-wax. The pipings or Grass may be taken off, cut across at the second joint, and placed under hand-glasses on a gentle bottom-heat; they will soon strike root. CARNATIONS and PICOTEES should be disbudded immediately. Occasional waterings with weak liquid manure will now be found serviceable. Offset TULIPS which are turning yellow in the foliage may be taken up, placed in paper bags with the name written outside, and hung up in a place where there is a free circulation of air. As the bulbs on the main bed become fit to remove, place them in their proper compartment in the cabinet; the skin and root may remain on till thoroughly dry, when they may be safely removed. Water Dahlias during dry weather; it will also be highly serviceable to mulch the surface of the soil with rotten manure, as prevention is better than cure; trap earwigs and other destructive insects on all available opportunities.

HARDY FRUIT AND KITCHEN GARDEN DEPARTMENT.

Black fly is sometimes very troublesome on the late Cherry trees at this season; it is, however, easily got rid of by dipping the ends of the shoots in tobacco-water, giving the trees a good washing with the engine next morning. This may occupy a little more time than the usual method of syringing, but it is a more certain remedy, and much less tobacco water is required. Lay in the young shoots of Peach and Nectarine trees, stopping any that may seem to be taking a decided lead, and endeavour to secure an equal state of growth all over the tree. Also persevere in stopping the breast wood on all trained trees, whether wall, espalier, or pyramidal, and proceed with nailing as expeditiously as circumstances will admit. Get Carrots, Onions, &c., thinned while the ground is in a favourable state, also get a good breadth of Broccoli and winter greens planted out if ground can be spared, otherwise prick out the plants in nursery beds, to keep them strong and dwarf until they can be permanently planted out.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending June 22, 1854, as observed at the Horticultural Gardens.

June.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Min.	Mean	Of the Earth. 1 foot deep.	2 feet deep.	Wind.	Rain.
Friday 16	20	29.772	29.622	60	53	56.5	56	56½	E.	.04
Satur. 17	21	29.657	29.568	67	45	56.0	56½	56½	S.W.	.45
Sunday 18	22	29.836	29.743	70	45	57.5	57	57	S.	.00

Thurs. 22	26	30.077	30.067	72	59	65.5	57	58	S.W.	.00
Average.		29.889	29.828	66.9	47.1	57.0	56.3	57.4		0.55

June 16—Hazy; rain.
— 17—Uniformly overcast; cloudy and fine; clear at night.
— 18—Very fine throughout; clear at night.
— 19—Very fine; cloudy; clear and cold at night.
— 20—Slight haze; fine; very fine, with clouds; clear.
— 21—Fine; cloudy and fine; rain at night.
— 22—Very fine throughout; cloudy and mild at night.
Mean temperature of the week, 4½ deg. below the average.

RECORD OF THE WEATHER AT CHISWICK,
During the last 28 years, for the ensuing week, ending July 1, 1854.

June and July.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 25	71.7	50.4	61.1	15	0.72 in.	1	1	5	2	5	8	4	2
Mon. 26	72.5	50.7	61.6	14	1.00	1	2	4	1	2	9	8	1
Tues. 27	73.2	51.5	62.4	16	0.80	2	2	2	2	4	10	6	—
Wed. 28	72.5	50.7	61.6	10	0.65	2	2	5	1	2	7	3	6
Thurs. 29	72.6	49.6	61.1	7	0.20	2	4	3	—	1	11	5	2
Friday 30	72.6	50.1	61.4	10	0.80	—	4	4	2	4	8	4	2
Satur. 1	72.1	52.3	62.2	14	1.23	1	2	5	—	4	9	5	2

The highest temperature during the above period occurred on the 27th, 1826—therm. 93 deg.; and the lowest on the 30th, 1849—therm. 35 deg.

Notices to Correspondents.

ARAUCARIA: *W M.* On no account give it, or other Conifers manure of any kind whatever. It is fatal to the race. If your plant requires to have its health attended to, open the ground round its roots in August next, remove any bad soil, and, replace it with a mixture of peat, loam, and sand, or loam and rotten *leaf-mould*.

BOOKS: *An intending Emigrant* will find no difficulty, upon arriving in Australia, in procuring "Sir Thomas Mitchell's Treatise upon the Cultivation of the Vine and other Mediterranean Crops in Australia." "Busby on the Vine" is another work of value procurable in the colony.—*A Z.* Moore's "British Ferns," last edition—for native species. There is no book answering to your description, upon exotic Ferns.—*J C.* "McCulloch on Wine Making."—*Beginner.* Paxton's "Cottager's Calendar," and "Mills on the Cucumber and Melon" will possibly suit you.‡

DISEASES: *S D.* The Pelargonium leaves are affected with the "spot," of which disease there are two or three forms, all arising, as far as we have observed, from imperfect drainage and ventilation, combined or separate. We should not recommend propagation from such plants, as the produce will very probably have a tendency to contract the same malady, under circumstances which would not affect a healthy stock.—*T Dodds.* The disease is doubtless at the root. The case is clearly similar to that of "Ivenensis," noticed at p. 392, to which we refer you.—*W C.* The affection of the Vine leaves, of which you have sent a specimen, is almost universal, especially in the north; and is probably due to want of light and depression of temperature, for which the present year has been so remarkable. Unhappily we have information that it is not confined to the leaves, but extends to the berries. The grievance is past remedy this year, but there is good reason to hope that with a more genial season it will entirely disappear. It is some comfort that your leaves exhibit no traces of mildew. *M. J. B.*

INSECTS: *C W S.* The Turnip-fly is a small jumping beetle (Haltica nemorum) reared from minute grubs which are found within the leaves of the Turnip and wild allied plants. The chief object is to promote the growth of the young Turnip as rapidly as possible by watering them, manuring the soil, and dusting the leaves with soot or lime. The perfect insects may be caught by drawing a sack rubbed with bird-lime, or a deep insect bag-net over the rows of young plants.—*H P J.* Your stick-like insect is the caterpillar of the swallow-tailed moth Ourapteryx sambucaria, a common species. *W.*

MAGGOTS: *Enquirer.* Try what effect gas water has on them ‡

NAMES OF PLANTS: *H G.* Epidendrum calochilum, Maxillaria punctata *var.*, Pholidota imbricata, and an Odontoglot unknown to us.—*G E W.* Some leguminous plant, but it is impossible to say what, in the absence of flowers.—*Carex.* 1, Carex remota; 2, C. sylvatica; 3, Festuca or Vulpia bromoides. *A H F C.* Veronica officinalis.—*J P., Tunbridge Wells.* Astrantia major.

WOODLICE: *T T D.* A toad or two put into your frames will soon be found to lessen their numbers.‡

TO AMATEUR FLORISTS, GARDENERS, ETC.

H. COLES & CO. beg to inform Floriculturists, &c., that their celebrated POT MANURE, which has given general satisfaction for so many years, may be obtained of the following Agents in packages, at 20*s.*, 10*s.*, 5*s.*, 2*s.* 6*d.*, 1*s.*, and 6*d.* each. For Amateur Rose, Fuchsia, and Chrysanthemum Growers, it will be found one of the best Manures yet introduced.

Agents:—Mr. G. Lawrence, Seedsman, Piccadilly; Mr. Hooper, Centre Avenue, Covent Garden; Mr. Gaines, Herbalist, Covent Garden; Mr. Wood, Seedsman, High Street, Marylebone; Mr. J. H. Tuck, Florist, Sloane Street, Chelsea; Mr. Rickets, Corn Chandler, Victoria Road, Pimlico; and Mr. Gibbs, 14, Portland Road.—Depôt, Albert Wharf, 10, Wilton Road, Pimlico.

TURNIP SOWING.

SUPERPHOSPHATE OF LIME, made from Bone, which is the best Manure for Root Crops (see the Royal Agricultural Society's Journal, Vol. vi., part 2). PERUVIAN GUANO, NITRATE OF SODA, BONE DUST, SULPHURIC ACID, and all other Manures of known value. The PEAT MOSS CHARCOAL COMPANY have appointed the undersigned Sole Agents for the Sale of this fixer and distributor of Ammoniacal matter. They are also Sole Agents (in London) of the Patent Sanitary Company for the sale of their "Nitrogenised Carbon."—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.

WM. INGLIS CARNE, 10, Mark Lane, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.

Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

NOTE.—By employing this Manure, at least half the cost of the best Peruvian Guano is saved, and, at the same time, all its valuable effects produced.—*See Certificates.*

THE "ECONOMICAL" MANURE.—The reports from this year's customers fully support the high character this valuable Manure obtained last year, and parties in immediate want of manure can be supplied with any quantity on the shortest notice. 1½ to 1¾ cwt. per acre is the proper quantity to be used, and must not be exceeded. Price 12*s.* per cwt., packages included, and put free on to the Railways in London, Manchester, or Birmingham. All particulars in the Company's pamphlet, to be had gratis, with samples, at the BRITISH ECONOMICAL MANURE COMPANY'S OFFICES, 10, Mark Lane, London, or sent free on applying to

BENJAMIN COVENEY, Manager.

NOTE.—For Turnips and Root Crops generally, where the seed is sown or the plant out of the ground, and in cases where from any cause it is weak, this Manure, mixed with about its own quantity of earth or ashes, may be put on the surface with great effect, and will be found to speedily force the growth of the plant, and give it an extraordinary vigour; or, as it quickly dissolves, it is not too late to apply it as a top-dressing for grain crops where the plant is sickly or the crop patchy.

All orders promptly executed.

*** Parties are referred to this paper of the last few weeks for the letters of those who have used the Manure with great satisfaction this year and last.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

BALANCE OF FACTS IN FAVOUR OF

RICHMOND AND CHANDLER, who have, in competition with the best selected CHAFF CUTTERS of the most celebrated makers in the trade, carried off the highest prizes against all comers.

COPY OF TESTIMONIAL.

"Early Court, Reading.

"GENTLEMEN,—I beg to hand you a cheque for your Corn Crusher; I must add, at the same time, that nothing can exceed the goodness of the Machine. I have found in it all I can wish, and, moreover a very superior finished Machine, and a pattern for other makers. (Signed) "GEO. SHACKELL.

"MESSRS. RICHMOND & Co."

Address—RICHMOND & CHANDLER, Manchester; and South John Street, Liverpool.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*

WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

SCYTHES.

BOYD'S PATENT SELF-ADJUSTING SCYTHE will last out three of the ordinary sort, and is always ready for use.

"We have seen this Scythe at work, and can strongly recommend it."—See *Mark Lane Express*, May 16, 1853.

To be had of every Ironmonger and Nurseryman in the kingdom; and wholesale and retail of WM. DRAY AND CO., Agricultural Implement Makers, Swan Lane, London.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.

PROFESSORS, &c.

Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.

The next SESSION will begin early in AUGUST. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

The GUIDE TO THE ROYAL AGRICULTURAL COLLEGE FARM may be obtained of HAMILTON, ADAMS, & Co., Paternoster Row, London; and EDWIN BAILY, Cirencester. Price 1*s.*

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL AND GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.—The Society's SHOW AT ARMAGH, in the Province of Ulster, will take place on the 9th and 10th of AUGUST next, when Premiums and Cups to the amount of 1200*l.* will be offered to competition for Farm Stock, Implements, &c. All entries must be lodged not later than 19th July.

Prize Sheets, and Forms of Entry, to be had on application to ROBERT COCHRAN, Esq., Secretary to the Local Committee, Armagh; or, to me, at the Society's Offices, 42, Upper Sackville Street, Dublin. THOMAS HARKNESS, Secretary.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—PROGRAMME.

THURSDAY, July 13.—Trial Yard open at Twelve o'clock at noon, when the public will be admitted, at Ten Shillings for each person, to view the Trials of the Steam-engines.

FRIDAY 14, SATURDAY 15, MONDAY 17, TUESDAY 18.—Trial Yard open at Nine o'clock in the forenoon, when the public will be admitted on each day at Ten Shillings for each person, to view the Trials of the Steam Engines, Barn Works, and other Agricultural Implements and Machinery generally.

WEDNESDAY 19.—The Implement Yard open to the public from Seven in the Morning till Six in the Evening; admission, 2*s.* 6*d.* each person.

The Judges to inspect the live stock and award the prizes.

At One o'clock (or as soon after as all the judges shall have delivered in their awards) the public to be admitted into the Cattle Yard, on the payment of Ten Shillings each person, at the Special Entrance; Members of Council and Governors of the Society being admitted by Tickets to be purchased at the Finance Department of the Society at the Show Yard.

N.B. Notice will be posted up over such entrance when the judges have completed their awards. At Eight o'clock in the Evening the Yard will be closed.

The Dinner of the Society in the Pavilion adjoining the Show Yard, at Four o'clock: open at Three. The Judges' Awards of Prizes for Live Stock will be read.

THURSDAY, 20.—The Cattle and Implement Yards open to the public from Six o'clock in the Morning till Six in the Evening; admission 2*s.* 6*d.* each person.

FRIDAY 21.—The Cattle and Implement Yards open to the public from Six o'clock in the Morning till Six in the Evening; admission One Shilling each person.

General Meeting of the Members in the Guildhall, at Ten o'clock in the forenoon.

The Agricultural Gazette.

SATURDAY, JUNE 24, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, June 28—Agricultural Society of England.
THURSDAY, — 29—Agricultural Imp. Society of Ireland.
WEDNESDAY, July 5—Agricultural Society of England.
THURSDAY, — 6—Agricultural Imp. Society of Ireland.

IT is one of the most difficult things to *read* any agricultural fact correctly. In farming, as in medicine, any number of *genuine* "cases" may be quoted by the vendor of the particular recipe, which, in either case, it is the object of the advertiser to applaud; but sensible men know how difficult it is to connect any observed result with the particular cause to which it is really due, and are not misled by the reports of cures, whether in diseases of the body or in barrenness of the soil, alleged to be affected by secret mixtures, whether they be medicine or manure. Take any of the cases (that, for instance, reported by Mr. BENNETT, of Cambridge), published by the advertisers, of the so-called "economical manure," and it is plain that, though not a doubt be entertained of the accuracy of its details, yet no one can draw the inference that it would be "economical" to purchase this manure for the soil which he may cultivate, without first ascertaining the composition of his land as compared with that of the field on which Mr. BENNETT'S results were obtained, as well as that of the manure itself, in order to know whether the efficient part of it might not be obtained at a cheaper rate elsewhere. On this subject we shall publish analyses next week. We allude to it incidentally in this place, as illustrating the importance of the subject on which Professor WAY threw so much light in his lecture last Wednesday. His subject was professedly the action of lime upon the soil, but both his own treatment of it and that which it received from subsequent speakers, involved a discussion of the whole question of fertility in soils; and so touched upon many other points beside the one especially on the card.

Among the facts brought out was the startling one that ordinary clay soils contain ammonia per acre, locked up in their substance, corresponding to the quantity present in three tons of guano. The main practical inference derived from the other facts which were adduced was, that lime should be applied at short intervals in small doses, rather than at long intervals in large doses, which is the more general plan. Of course the uses of lime in correcting acidity, and its action on excessive vegetable matter, were independent of that particular purpose which Professor WAY believed it to serve in relation to the ammonia of the soil; and for the former a sufficiency of the lime or chalk had to be applied on grounds already well known, and insisted upon by Sir JOHN JOHNSTON and Mr. BEALE BROWNE after Mr. WAY had concluded his remarks. But the annual use of *caustic* lime in small quantities, for the purpose of setting free a portion of the ammonia locked up in such abundance in a dormant condition, has a more general and probably a universal bearing on farm practice, when the other aspects of the matter may be of only local importance.

The results of the experiments on which Mr. WAY's conclusions are based were given in very few figures; but they had occupied an entire department of his laboratory during nine months; and confirmed, as we believe they will be, by ordinary farm experience, we doubt not that they will exercise an important influence on farm practice for the future.

When the lecture shall be published in the Journal of the Society, the facts of which it speaks, and the inferences to which they lead, will, we believe, be seen to stand high among the very important additions to agricultural truth for which we are already indebted to the chemist of the English Agricultural Society.

IF DOUBLE-DIGGING and HAND-FORKING be regarded as impracticable on a large scale, and rotary machines for performing these operations be too unusual or unproved for timorous farmers, let us see what may be possible in the annual Wheat-growing system, with common horse implements. Our scheme would be to take a field of deep loamy soil, well drained, plough, clean, and level it, and harrow at the proper time, as for Wheat sowing. Drill Wheat with only three coulters, set at say 11 inches apart, and if your drill-wheels be about 6½ feet distant from each other, by following the wheel-marks, you may easily drill the triple rows in stripes, so as to leave intervals of about 4¼ feet breadth—this being the width of four large furrows, with a few inches to spare on each side as protection to the Wheat. At these distances, there will be an average of one row of corn for every 24½ inches of ground, instead of every 20 inches, as in Mr. SMITH'S system. When the young plants are well up, draw a ridge down the middle of each interval, opening a furrow with the first round; then throw back the two furrow slices, forming a common "backed-up" ridge, and plough one more furrow to cover the first; there will now be three furrow-slices forming a high ridge, with all the land underneath them also ploughed, and there will be two open furrows on each side, within 4 or 5 inches of the Wheat. Let the intervals be thus exposed to winter frosts; or if too compact, skeleton plough them, or drag the stout tines of a Bentall through them; the horses in this operation, as also in the ploughing, walking "at length" along the furrows. When the great frosts are past, set the cultivator to work, stirring the staple to its full depth, and horse-hoe, hand-hoe, and weed whenever necessary throughout the summer. After harvest, proceed in a similar manner with the other alternate spaces, drilling those now fallowed and prepared. It is impossible to plough very deeply so close to the first furrow; perhaps only 6 or 7 inches of mould may be obtainable. Therefore, to imitate the double-digging—which follows upon the same ground *biennially*—*plough the whole field* after harvest *two furrows deep* every other year, or every third year, as may be required. This will bring up fresh soil from 10 or 12, or, with a proper trenching plough, 14 inches depth. Deep ploughing occasionally will thus prevent the formation of a hard pan from the ordinary ploughing; and, indeed, the subsoil plough might be made to follow in every furrow made by the common plough.

Upon the new unmellowed earth it will not be advisable to sow Wheat; but winter Beans, alternated, if you like, with roots in the summer, might be grown for this occasional year. If there should

be any sign of failing vigour in the land, after a course of years, a double digging by manual labour may be commenced, and gradually extended in a few seasons over all the fields appropriated to this system. But it is reasonable to suppose that such costly work would very rarely be necessary.

The above order of tillage may be much inferior to that of the spade and fork; but with the greater cheapness of ploughing, dragging, and drilling, we should be remunerated by many bushels per acre less than Mr. Smith has obtained.

"But have you tried your scheme; can you give a statement of real expenses and returns?" No. We are anxious that the benefits of the new husbandry should not be lost, and propound this mode of further experimentalising upon it, as more likely to meet with a trial. Balance-sheet proof we have none; and, indeed, from observation of other proposed improvements, do not know that our scheme would fare any better for it. The experience of Tull should be a sufficient inducement to enlightened agriculturists to make this attempt after his model. If his tillage met with such success with clumsy imperfect implements, of far less variety than we possess, and when under-drainage was neither understood nor practised as it is now, may not we be confident of far excelling him upon similar soil? But, take the example of the most celebrated cultivator of his day, Mr. Ducket, of Esher, in Surrey, who in the latter part of last century introduced a sort of medium between Tull's and the previous agriculture. He employed a trench-plough and a smaller plough, each of which had two shares, one placed directly over the other, subsequently exchanging the latter for a skim-coulter plough, by which he could pare and bury any long vegetation, and cover it with a second furrow, at one operation. One deep ploughing with the trench-plough to every other or every third crop, with ordinary or shallow ploughings with the lighter two-share plough for all other crops, formed his method of using them. By the former operation fresh earth was brought up. The shallower ploughings with the two-share plough loosened and divided the soil for a seed-bed—like Tull's four-coultered plough, cutting the furrow-slice so as to render the after comminution more easy. There was also a great advantage in ploughing at two different depths in successive years; as, when the same depth is maintained year after year, the rain-water becomes lodged between the loosened and unmoved earth, stagnating and injuring vegetation. By this system of ploughing, combined with drilling and horse-hoeing, he was able to achieve the marvel in those days of keeping 500 acres of "friable, sandy loam, with tenacity enough for bearing great Wheat crops" always under crop—never bare-fallowed—most of his products far excelling those then found on the best cultivated lands of the kind.

Let some approach be made to the Lois-Weedon degree of pulverisation; and, though we may not hope to dispense altogether with manure of some sort, we may surpass our common husbandry as Mr. Ducket did that of his less forward times. *I. A. C.*

AGRICULTURAL CHEMISTRY.

SESSIONAL EXAMINATION—ROYAL AGRICULTURAL COLLEGE.

[We publish in a condensed form the answers of Mr. Louch to the following questions.]

3. How can you distinguish Cane from Grape sugar?
6. What are the best means of preventing decay in timber?
7. What is the reason that milk becomes coagulated when it is kept for some time in an open vessel?
8. What is the composition of bones?
9. Mention the general composition of urine, and state on which of its constituents its fertilising value principally depends.

(3.) In the first place the composition is different: that of Cane being carbon 24, hydrogen 22, oxygen 22, and water 4; and that of Grape being carbon 24, hydrogen 21, oxygen 21, and no water. Cane sugar, on addition of yeast, is not changed into carbonic acid and alcohol; before this it has to be changed into Grape sugar, therefore Cane sugar does *not* ferment. Cane sugar, too, is more soluble and more sweet, and is whiter; besides these distinctions, there are chemical tests.

(6.) A ready means of preserving wood from decay is subjecting it to the action of a running stream, which washes out the albumen and the sap: the principal cause of decay in wood being the sap in the plant, which, after it is cut down, acts on the albumen like a ferment, and thus causes the wood to decompose. Now, if we can only remove this sap or ferment, and render the albumen insoluble, or altogether remove it, we can preserve the wood. One way is to inject by hydraulic pressure an iron salt (as acetate of iron, or pyrolignite of iron), or bichloride of mercury, which combines with the albumen, forming an insoluble compound; another way is to allow a metallic salt (one of the former will do) to penetrate the tree by capillary attraction; another plan is to smoke the wood, the creosote contained in the wood having a very powerful antiseptic action, to which it owes its uses in preserving anatomical specimens. Tarring wood is another way, also charring it before putting it in the ground; another plan is to immerse the tree, whilst green, in a solution of some salt, as pyrolignite of iron, in a large vessel; this finding its way into the plant renders its albumen insoluble. This is Bryant's process, the one by hydraulic pressure is Kyan's.

(7.) When milk is exposed to the atmosphere, the sugar undergoes a decomposition, primarily produced by the casein existing in the milk; this casein then acts on the fatty matters and fatty oils in butter, and decomposes them; from the sugar is produced lactic acid, which combines with the potash and soda previously combined with the casein, and so precipitates the latter, thus coagulating it or forming an insoluble compound. This lactic acid has the power of combining with zinc, lead, and mercury; hence, although zinc vessels give more cream, yet lactate of zinc being soluble, is dissolved in the milk, and thus zinc vessels should never be used, as this salt must affect the system.

(8.) Bones contain two-thirds of bone-earth and one-third of organic matter. They generally contain 10 per cent. of fat, 6 per cent. of carbonate of lime, 42 to 44 per cent. phosphate of lime, and a little phosphate of magnesia, and 16 per cent. of glue or gelatine, capable of yielding ammonia. But the composition of bones considerably varies, as in the young animal we find the organic matter preponderates more than the inorganic in comparison to what it does in the adult animal. The bones, too, of different animals vary much, and especially at different stages of the animal's existence. Bones are dependent on their supplies from the blood, and consequently, if an animal be very badly kept, they cannot be so rich as in one better kept, and in first-rate condition.

(9.) The urine of our domestic animals considerably varies in composition, being richest in man, sheep, pigs, and the horse; these contain phosphoric acid, but cows' urine, &c., contains little of it. This is supplied by their solid excrements. Urine, chemically speaking, consists of urea, uric acid, alkaline salts, and phosphates and carbonates of lime, chloride of alkalies, a little phosphate of lime, and of magnesia in man; and phosphoric acid in that of pigs, if they live well. When you allow urine to stand quietly, it deposits the triple phosphate of ammonia and magnesia. Fresh urine is acid, containing lactic acid; when kept two or three days it is alkaline, from formation of ammonia, and the urea is changed into carbonate of ammonia. Urea contains more nitrogen than flesh, blood, or many highly nitrogenised manures, and it is to this urea that the highly forcing properties of liquid manure may be attributed. As to the constituents of its fertilising value, we may consider urea and uric acid as having much to do with it, as they both contain so much nitrogen; besides, we find potash salts predominant in urine, also phosphoric acid in that of man, pigs, &c.; did urine contain only the sulphates, phosphates, and carbonates which it does, we could easily account for its highly fertilising action; but besides these, on decomposition urine gives off much ammonia, which, if we fix it, we can use. We find in urine the chlorides of potash and soda, too, some sulphate of ammonia, and, in fact, everything that is required for the luxuriant growth of plants; but yet we find an admixture of the liquid and solid excrements to be much more beneficial than either alone. In fact, the two well preserved form the universal manure.

THE PIG.—No. I.

We last year offered a few observations relative to the appropriation of a farm for the purpose of breeding and rearing pigs for sale, instead of the usual descriptions of farm stock. They were intended to show the difficulties that would necessarily arise from such an exclusive appropriation, and also to point out in our humble way the best course to be pursued in rearing and supporting the greatest number of this particular kind of stock—the pig. We then promised at some future day to give our views upon their breeding and general management, and we now purpose in a few short papers to redeem our promise.

The Improvements in the Breeding of Pigs.—Prior to the establishment of the Smithfield Club Cattle Show, the breed of pigs in this kingdom had undergone but little change for centuries. The old breeds are generally described as large, coarse, and ill-formed. We give a few specimens of the descriptions we usually find in our readings. The old Berkshire breed is described as being "in general of a tawny white, or reddish colour, spotted with black; large ears hanging over his eyes—feeding to a great weight." The Essex—"up-eared, with long sharp heads; roached backed; carcases flat, long, and high upon the leg." The Lincoln—"extremely long-legged and weak-loined; very long from head to tail; long coarse curly hair; tolerable feeders, but flesh coarse and flabby." The Norfolk and Suffolk—"a short, small, low-standing, prick-eared, inferior kind, only serviceable as porkers." The Kent and Sussex breeds—"long in their legs, narrow in their backs; grow to a large size." The Cheshire breed—"grow to a gigantic size, remarkably long; long bony legs; heads large, ears long and hanging; back much curved and narrow; sides flat and deep." The Hampshires as—"longer, flatter, and coarser than the Berkshires." The Wiltshires as—"long-bodied, low, hollow about the shoulders, and high on the rump." These are specimens of some of the old English breeds. The old Irish are described as being of "the size of a large jackass, and very large-boned; very long, narrow in frame, very mis-shapen; long large ears, hanging low." The old Scotch as—"small in size, grey colour, long, shaggy hair, very hardy."

This very meagre outline will suffice to show that improvement was absolutely necessary; and, great as have been the efforts of the Smithfield Club and triumphant their success, yet they have been surpassed by the Royal English Agricultural Society, and other similar societies have laudably emulated them, so that the improvements in the various breeds have been so great and so extensive as to supersede all the old breeds, and to render an individual animal of the old species a rare curiosity.

The first step in this march of improvement appears to have been the crossing of the native breeds with the Chinese, the Neapolitan, and the other breeds native to the countries bordering upon the Mediterranean; for be it known that the pig is found almost everywhere throughout the world, and in many countries the breed was superior to our own native breeds; but the enterprise of the British people could not long endure this, and their introduction was the consequence, and ultimately the crossing with our own has placed the breed of pigs of this country at the head of the nations. We would observe that this is no small achievement, trifling as it may seem. Agriculturists are often taunted with the comparative littleness of their doings—in this very thing they have done much to supply one of the principal wants of the country. The consumption of pork is immense, and the breeders of pigs have attained to such a state of improvement as to be able to produce more than double the quantity of pork, and of far better quality, in the same space of time, and in which they excel all other countries.

The Old Berkshire breed of pigs had probably obtained the greatest favour of any of our native breeds, and the improvement which it has undergone has quite equalled, if not excelled, all other breeds, so that its popularity is still undiminished. In this improvement, we have a continuation of its old character—to fatten to a large size; but, what is of far greater importance, this large size is obtained at a very early stage of growth, and specimens of the justly celebrated Coleshill white breed have been exhibited, having attained astonishing weight at a very early period. We presume this variety to be derived from crossing the old Berkshire with the white Chinese. There are other improvements made in the old Berkshires of a black colour, and the specimens which we have seen induce us to conclude this cross to be derived from the black Neapolitan or Maltese pig; we scarcely know which is the more valuable variety, both are great acquisitions to our stock of pigs, and deserve extensive diffusion throughout the kingdom.

The Essex Pig.—This breed, we think, stands next in public estimation; it is not so large in character, but in quality it is superior to the improved Berkshire, but it has been so often shown in competition with that breed, and so often borne the palm, that we will not pretend to decide which is the best kind of pig. This we know, that both are most valuable varieties of the pig. We think the Berkshire would produce the greatest weight of food in the same space of time, as the original old Essex pig was not equal in size to the old Berkshire; and we are of opinion that their improvement has been derived by crossing with the black Neapolitan or black Chinese pigs, which, being similar in size to the white Chinese, would favour such opinion. We incline to conclude that from these two sources of improvement sprang the general improvement of the British breed of pigs—they were the breeds which obtained the greatest popularity—they were most continuously exhibited, and obtained the greatest number of prizes—their progeny was most sought for by breeders, and hence the general improvement which followed. This opinion is further confirmed by the fact that we have two general distinctions of the breed of pigs—the large breed and the small breed; the large breed, properly so called, is a continuation of the original breeds, improved by various crossings amongst such breeds. The small breed, properly so called, is the improvement derived from the crossings with the Chinese or Neapolitan breeds as named above. Such, however, has of late years been the spirit to effect improvements in the various breeds, that it has become impossible to tell where the large breed ends or the small breed begins; both have been surprisingly improved, and the breeders of the small character of pig have not only succeeded in retaining such character, but have obtained that thick, compact, broad-chested, well-made form of the small breed upon a large frame, with every corresponding advantage of early maturity, fineness of flesh, and lightness of offal. Indeed, such is the size attained by this class of pigs, that judges at our various meetings can only determine the peculiar breed by the general character of the individual animal, as in point of size he will often outstrip his gigantic neighbour of the large breed. As our great improvements in the breeding of pigs have been derived from the Chinese and Mediterranean countries breeds, we will in our next give an outline of the principal features, to show their peculiar adaptation to improve our native breeds. *J. C.*

ON INTERLINING CROPS.

"It is evident that two plants growing beside each other will mutually injure one another, if they withdraw the same food from the soil. . . . Plants will, on the contrary, thrive beside each other, either when the substances necessary for their growth, which they extract from the soil, are of different kinds, or when they themselves are not both in the same stage of development at the same time."—Liebig.

For some years past the interlining of several families of plants cultivated for their legume, leaf, and root production, and which we conveniently denominate generally

green crops, has been creeping into practice, and has been admitted to be attended with far greater returns than where only one family of plants has been grown; but, with the exception of the Hardys, I am not aware, further than the advocacy I have given to it, that any one has introduced in this connection a grain crop; and this does certainly appear anomalously curious, for in our most modern and approved system of agriculture it is precisely the rotation that obtains. If it be admitted that the introduction at annual intervals of a grain crop between green crops is good husbandry, surely, upon every principle of science, the immediate intervening of a grain crop with green ones must be better husbandry. If two green crops of diverse families take up from the soil and air different proportions of elementary aliment, all our preconceived notions, as well as analysis, plainly tell us that a grain and a green crop will do the same in greater disproportion. Chemistry tells us that elementary bodies more readily form new combinations at the moment of their disengagement; surely, then, one plant in contiguity at the same time with another must more readily imbibe and appropriate the elementary matter which that other refuses or throws off, and which assimilates to its composition, than where 12 months are allowed to intervene—a period in which, most probably, such matter has formed antagonistic combinations, has entered into some other compositions possessing for it stronger affinities than those of the plant to which we would offer it, if it may not have passed altogether from the soil in the evaporations which are continually going on. A grain crop also, I think, in this connection affords greater facilities in its upright and less spreading growth, not even excepting Beans, for more protracted hoeings, than do any of our green crops. It may be hoed till in ear, if sufficient distance is allowed for the operator, and it is not necessary that distance should be so large as to lessen its acreable production.

To assist in elucidating this view, I instituted the last year three separate experiments, and all three have borne out my expectations, although the very harsh, dry, and backward spring was very much against them in preventing the early tillering so essential to a thin-sown crop.

One acre of land was sown in rows 18 inches apart with Bere, Barley, and Oats, the produce by calculation about 155 stones. Although not in the same field with the experiments, yet I consider it sufficiently under similar conditions to admit of their returns entering into comparison with it, and its produce far exceeded the rest of the field sown broadcast. The whole experiment is, I admit, but an approximation to the truth. It is as near a one as, under my present circumstances, I could arrive at.

In the first experiment a plot of ground containing 384 square yards was finished sowing in April 14, in sets of two and three rows alternately of Barley, the rows 16 inches apart, the intervals between each set of rows admitting of three rows of Carrots at the same distances apart, that is, 16 inches; the proportion of ground under grain was three-sevenths, that under Carrots four-sevenths, the produce of Barley was 9 stones, or, on the acre, 113 stones.

The second experiment, a plot of ground containing 240 square yards was sown on April 15 with double rows of Barley, 15 inches between the rows, at intervals between the double rows, admitting of three rows of Carrots at the same distances apart (15 inches); the proportion of ground under Barley was two-fifths, that under Carrots three-fifths, the produce of Barley 5 stones, or, on the acre, 100 stones.

In both these experiments, from the dryness of the spring, the Carrots only vegetated partially, and were also much diseased.

The third experiment, a plot of ground containing 184 square yards was sown on May 10 in double rows of Barley, alternating with double rows of Ash-leaved Kidney Potatoes, the distance between each row being 18 inches; thus one-half the ground was under Barley and one-half under Potatoes; the produce of Barley was 4 stones 12 lbs., or, on the acre, 128 stones; the produce of Potatoes 2 cwt., or, on the acre, 2 tons 12 cwt. Thus 1 acre of grain in rows 18 inches apart gave 155 stones; the first experiment, three-sevenths of acre under Barley, 113 stones; four-sevenths do. under Carrots failed. The second experiment, two-fifths do. under Barley, 100 stones; three-fifths do. under Carrots failed. The third experiment, one-half do. under Barley, 128 stones; one-half do. under Potatoes, 2 tons 12 cwt. So also I have found in a tillage of Potatoes interlined with Rape a much larger yield than where the whole ground was occupied by Potatoes.

Of a plot of ground a little under the fifth part of an acre (889 square yards), 153 square yards were planted with small Potatoes (whole) in double rows, the double row and furrow being 4½ feet wide; the produce was 20 stones of sound Potatoes, or, on the acre, nearly 4 tons. The remainder 736 square yards in the same breadth of ground (4½ feet) was planted with similar Potatoes in single rows, and between the rows of Potatoes in the first week of August, two rows of Rape were planted out. One-half of the ground was therefore under Potatoes and one-half under Rape; the produce in sound Potatoes was 78 stones, or, on the acre 3 tons 4 cwt.; thus on the half acre there were only 16 cwt. less than on the whole one, with half an acre of Rape spreading somewhat over the ground on the decaying of the Potato haulm from the disease. There are four Rape plants on every yard of ground; I have weighed eight of them, taken together, not picked, their weight 12 lbs., or, on the acre (half), 13 tons. Thus 13 tons of Rape are gained with a loss of 16 cwt. of Potatoes.

The ground was moor land, from which a crop had been taken five years back, and then neglected. I had not an opportunity to begin on it till May 20, when I commenced by paring and burning a part of the moor, the ashes of which were the only manure used for the Rape, seed beds, and the Potatoes. On May 27 I commenced preparing the ground for the Potatoes by laying a sod from 6 to 9 inches broad, with a spade, on each side of the ridgelets, leaving a space of about 9 inches between them in the centre of the ridgelets, in which, as we proceeded, I planted the Potatoes in single rows 1 foot from tuber to tuber, which were covered, and between the sods filled up with broken mould from where the sods had been turned, using in this way only the furrows on one side of the ridgelet, reserving the other for covering the ashes. Thus between every ridgelet was left a space of about 27 inches, in the centre of which remained an unstirred sod 1 foot wide, and upon which the ashes for the Potatoes were wheeled by a barrow; when this was accomplished and the ashes covered by the mould from the remaining furrow, this sod was turned, broken, and ashes wheeled on, which were partially worked into the ground by a hard drag, similar to the one recommended by Mr. Yule, of Armagh, and then planted with Rape in double rows a foot asunder, and the plants a foot apart.

The cost of all these operations was not very great; it ought not to be enough to frighten even an Irish farmer. It amounted to—

	£	s.	d.
Paring and burning	0	2	0
Seed Potatoes, 8 stones, at 6d.	0	4	0
Planting Potatoes, and covering them	0	4	0
Drawing on ashes and covering	0	3	0
Preparing and sowing Rape beds and seed	0	2	6
Turning sods and breaking them in intervals for the Rape	0	2	6
Drawing ashes and planting Rape	0	3	4
Digging and drawing Potatoes and pitting them ...	0	3	6
Expenses incurred on 889 square yards of ground ...	£1	4	10

No rent—this moor-land being of little value, is not measured on the tenant.

	£	s.	d.
98 stones of Potatoes, at 5d.	£2	0s.	10d.
2 tons of Rape, at 6s., for feeding, on the 736 square yards (half)	0	12	0
	£2	12	10

As there are four Rape plants on every yard of ground, the amount of the Rape crop has been estimated by weighing eight plants.

Thus, with so late a tillage, after all spring work was over, a profit at the rate of 7*l.* 12*s.* per acre has accrued on waste land, and the land brought into a profitable state, requiring very little labour to ensure a good crop next year. Had the Potatoes been planted a month earlier, the return would have been much higher, as they were not half grown when the stems were attacked by the blight and the growth checked. *J. M. Goodiff.*

Home Correspondence.

Crops in West Somerset.—The Wheat in this neighbourhood until very lately has been looking well; but within the last week it has assumed the red tinge too clearly indicative of rust, which is now, I fear, a subject of general complaint throughout England. Barley has now recovered the effects of the drought it experienced during its infancy, and appears a good average crop. Oats look well. Mangold Wurzel and early Turnips are promising; and not the least symptom of disease appears in the Potatoes. Haymaking has just commenced, and will, I fear, prove "light;" the weather hitherto has been unfavourable. However, we will hope that—

"Though clouds may dim the sky to-day,
'Twill all be bright to-morrow."

W. P.

Wheat in Dorsetshire.—We regret being obliged to corroborate the many statements of the doubtful appearance of the Wheat crop; the plant, in too many instances, is thin on the ground, and the ear, which comes out slowly, is small and uneven; the leaf is almost invariably affected by a kind of rust, or blight, but we have seen no sign of mildew in the stalk. Barley and Oats are looking very luxuriant; and although, in some cases, the former did not come up regularly, in consequence of the long drought, still we hope an extra number of bushels will compensate for want of uniformity of sample. *R. G.*

Crops in East York.—The past season, as a whole, may be considered favourable to the preparation and cleaning of land for Turnips, and other green crops. Potatoes, owing to the late rains, are looking remarkably well. The odd patches of Mangold Wurzel to be seen here come up but in an indifferent manner, especially where due attention was not paid in preparing and getting in the seed. Our Mangold Wurzel has brairded better than usual, and has now attained to the size and stage of thinning. Turnip sowing on the wolds may be said to have been complete a week ago, and are looking well—even on the low grounds adjoining, this operation will have been brought to a close during the present week. Wheat generally is looking well; and we anticipate an early as well as an abundant Wheat harvest, as it is now coming rapidly into ear, though, in some instances, it has spindled, and begins to look thin in the rows. The blight (which here is termed honey dew), as reported from other parts of the country, has extended to here. I noticed it about the 1st of this month, having been through some Wheat fields. I perceived my boots began to assume a yellow colour, and, on more close examination, I discovered that mildew had set in in the form of scales, within a few inches of the ground. It occurred to me at the time, that it was occasioned by the heavy rains which fell during the latter part of May; and were it not, in my opinion, for the sharp drying N.E. winds, which continued during the first week or ten days of this month, and which had the tendency to mar the progress of the blight, the result might have been serious; then, as regards the present stage of the disease, no great danger need be feared, so far as the Wheat crop in this immediate district is concerned. Barley is looking a fair crop; but Oats may be reported as an indifferent bad crop, having been shrivelled up to a brown colour by the winds already alluded to. Pastures are now pretty good; but meadows are rather light. Sheep shearing is now complete, and I am informed that the number of coated fleeces among large flocks this season was more than usual. I should feel thankful for a little scientific information on the probable cause and remedy bearing on this subject. Wages range here, on almost every farm, from 14*s.* to 15*s.* per week, and extra work 3*s.* per day; boys' wages from 6*s.* to 9*s.* per week. *P. Deane.*

Rust in Wheat.—The rust complained of in your Leading Article of the 17th inst. is, I conclude, one of the Uredines—very probably Uredo rubigo. The probable occasion of its appearance arises from the foetid (rancid, impure) and damp air contained in the clods of earth, for want of closer comminution of the soil and consequent free circulation of the elements. The sap eliminated from the minerals in conjunction with foul air causes the plant to become diseased, and to exhale from its stomata or mouths an atmosphere adapted for the vegetation of that variety of the fungus. The best remedy is to expose the atoms of the clods forthwith to the air, and generally stir the soil around the plants most carefully with a hand-hoe, and the diseased plants will be found to revive and throw off such disease in due course, the quicker according to the different stages of growth of the blight and general tillage of the soil; and further, such stirrings needs be continued throughout the season as long as practicable. This advice is deduced from much study. The remedy will be found equally efficacious to any of the order Coniomycetes or dusty fungus, mildew, or mould. *Agricola.*

Management of a Farm.—I observe that you have been lately trying to obtain the serviees of an active and intelligent bailiff to manage a farm of 1000 acres, 800 of it in heath; a long narrow strip of land, the farm-house and buildings all at one end; it being difficult to decide where or how the new buildings should be erected, or upon what system to farm it to best pay the owner, &c., &c. They may be called matters of serious consideration, but easily determinable by a practical farmer or bailiff. The plan that I would advise the owner to adopt is to advertise for a bailiff to manage this farm, and out of the many applications for the situation, four or five may be selected as most likely to suit for such a field. In reply to their applications, furnish them with a plan of the estate, nature of the soil, and all particulars thereof, requesting them to make a design of one or two sets of buildings, or merely an addition to the present buildings, necessary for the extent of the farm, and what the cost would be to erect said buildings—accompanied with the system they should adopt to farm and reclaim this wild field or wilderness. A day should be named when the appointment would take place—allowing them a reasonable time to come forward with their productions. If the owner of the said farm strictly adhere to the above directions, there is no doubt he will succeed in getting a bailiff master of the abilities requisite for such a field. The writer thinks it quite essential that there should be two sets of buildings, or home-steadings, erected; as it might, at some future period, let as two farms; but if farmed by the owner, in like manner it would be of great advantage, saving a deal of horse-labour in harvest, and in carting manure to the fields again. *A Bailiff.*

Societies.

ROYAL AGRICULTURAL SOCIETY.

Special Council, *June* 21.—Colonel Challoner, Trustee, in the chair. The following subjects and prizes for the reports and essays to be sent to the Secretary on or before March 1, 1855 (and of which the full terms and conditions of competition will be given in the next Number of the Society's Journal), were finally arranged.

	£	s.	d.
Farming of Warwickshire	£50	0	0
Farming of Buckinghamshire	50	0	0
Chemical changes in the fermentation of dung	30	0	0
Artificial manures, and principles of their application	20	0	0
Artificial feeding stuffs	20	0	0
Causes of fertility and barrenness in soils ...	40	0	0
Retention of moisture in dry Turnip land ...	10	0	0
Prevention and cure of mildew in cereal crops	20	0	0
Lameness in sheep and lambs	20	0	0
Any other agricultural subject	10	0	0
	£270	0	0

Action of Lime.—A weekly Council was then held, when Professor Way delivered before the members a lecture on the results of a nine months' investigation into the conditions under which lime affects the absorptive power of soils in reference to ammonia. These results were numerically represented in a small table, containing only four vertical columns, intersected by as many horizontal spaces; but would prove, as Prof. Way remarked, of a permanent value, worth all the time and labour bestowed upon their production, if they should be found to lead to the establishment of any new principle in agriculture. His lecture was chiefly occupied in the

discussion of these results, and of the clue they might possibly give to explanations of the mode in which lime acted upon soils as a manure. The two principal facts ascertained by these experiments appeared to be the following:—1. That all clay soils, more or less, even beyond the depth of 20 feet, are found to possess a certain quantity of ammonia, derived, as Prof. Way supposes, from the fishy and vegetable matter of beds of lakes or rivers, no bed of clay whatever, he thought, being entirely free from ammonia. 2. That the addition of lime to a soil set free one-half the ammonia it contained; thus acting, in the first instance, as a "stimulant" to vegetation, but as an exhauster of the stock of ammonia already in the soil or to be slowly derived from the atmosphere, if applied in large quantities. The two principal recommendations were,—1. That liming should take place periodically at short intervals, not more than from 8 to 10 bushels per acre being used every year, or every two years: lime would, under such circumstances, he thought, be found to be one of the most useful adjuncts of the farm. 2. That lime when slaked and mixed with water, forming what was known as "milk of lime," should be added to tank-water, and distributed by means of piping, as in the case of Mr. Mechi's operations at Tiptree, or Mr. Kennedy's, at Myre-mill.—Prof. Way, in the course of this lecture, entered into most interesting details connected with the chemical machinery of the double silicates in the soil, by which the action of lime was regulated; and with the experiments he had instituted for showing, in strong comparative contrast, the results he had obtained. He also pointed out the great importance of giving to land, by means of suitable cultivation, that condition under which it would best act as an absorbent of ammonia from the atmosphere. He has drawn up a complete statement of these details, which will be submitted in due course to the members, in the pages of the Society's Journal. Colonel Challoner, Mr. Woodward, Dr. Calvert, Sir John Johnstone, Mr. Beale Brown, Lord Berners, Mr. Fisher Hobbs, Mr. Payne, and Sir Matthew Ridley, favoured the Council with the results of their own experience in the use of lime of different kinds, and on various soils. These results depended much on the nature of the lime itself, on the mode and time of its application, and on the condition of the land to which it was applied. The chairman remarked that the great value of discussions on questions of that kind was the production of evidence indicating results diametrically opposite to each other, obtained under the same management, and the great value it proved of the establishment of sound general principles in agricultural practice, by means of which exactly the same results might be expected to recur when repeated under exactly the same circumstances. On the motion of Lord Berners, seconded by Mr. Lawrence, the best thanks of the meeting was voted to Prof. Way, for his interesting lecture.

FETTERCAIRN. *Steam Ploughing.*—At a recent meeting of this club, Sir John Forbes, as President, described some of the machines which have been invented since 1836 for this purpose:—The first attempt was by Mr. Parkes, civil engineer, who, upon Chat Moss, between Liverpool and Manchester, about the year 1836, put in motion a plough attached to a band the length of the furrow to be turned over, which communicated with a fixed engine at the one side, and a wheel round which it turned at the other, and thus turned over a very good slice of moss.—This idea was improved upon by the Marquis of Tweeddale, who has made use of a moveable engine at each end of the ridge, which alternately draw a double plough, making two furrows at a time, backward and forward. The operation appears to have been well performed where the land, from being level, and of a pretty uniform quality, would be adapted for it; and for trench ploughing, the operation might not be too expensive; but this, as well as an ingenious application of water power to the same object, by a miller in Perthshire, is felt to be suited only for particular situations; and the public attention has been of late directed rather to a different application of power, and a change in the actual operation. The common plough has long been felt to be an imperfect implement, theoretically considered—the spade, or fork, or grubber, having the advantage of working without a sole, which, as it were, paves the furrow at the bottom, counteracting all the anxious efforts in other operations to keep the subsoil open. This, no doubt, is less felt where land is furrow drained; but it is an objection; and so is the continuous nature of the slice thrown up, which does not admit the air so effectually as it would if more completely broken, and comminuted. There are four implements of the digger or grubber kind, to be worked on a large scale, before the public. Of these Mr. Samuelson's, and Mr. Romaine's of Montreal, which was brought out in this country by Mr. Mechi, are grubbers or cultivators; Mr. Guthrie's of Rephad, Stranraer, a regular fork digger, and Mr. Usher's, a revolving plough. Mr. Samuelson's has not been applied to power by steam; it was worked in Oxfordshire in March last, and in Berwickshire in October, by five or six horses—the tines were to go from 6 to 9 inches deep, and it is 3 feet in breadth. The labour over soft land is immense, and it is pronounced by Mr. Wilson, of Edington Mains, and others, as unsuitable for lea; unless worked by steam, separate common grubbers would do more work. Through the kindness of Mr. Mechi, I received the model of the American plough in time for the meeting of the club, had it not been postponed by the frost; but as Mr. Romaine was to take it back to Canada, and sailed on the 24th of April, I was obliged to return it without being able to show it to many members of the club. It was a combination of steam and horse power, the horses being probably intended to turn it, though it seems as if the engine could accomplish that. The motion was communicated to the axle of the open cylinder with the tines by a toothed wheel in a groove in the middle of it, into which another worked, and this seemed likely to obstruct the work by being too near the soil, and liable to be clogged, besides the objection that horses could never work yoked to a steam-engine. Mr. Mechi describes it as what it really is, a revolving grubber or harrow, 6 feet wide; the cylinder, having 200 tines, would revolve 240 times per minute, and being moved by the horses at the rate of two miles an hour, with 20 real horse power in the engine to work it, it should comminute 40 to 50 tons of earth per minute. The two points of difficulty here would be the moving of it over soft land with such an enormous weight, and only four common wheels to support it; and the point whether the operation would after all be satisfactory, as supplying the place of the whole ordinary work of cultivation. The next machine I have to notice is Mr. Guthrie's, who has kindly sent me a model of a small portion of it, exhibiting the way in which the forks or diggers are most ingeniously forced into the ground, and turned over, so as completely to reverse the earth on coming out again. This is repeated six or eight times on an axle moved by steam, and revolving 50 or 60 times per minute, to move only two-thirds or three-fourths of a mile per hour. This very ingenious machine is intended to complete the operation of digging, without question the most perfect preparation of land, all over our fields, and, according to Mr. Guthrie's calculations, at a much less expense than the process of ploughing at present in use. It has been the longest of any of these machines in model; and though it has never yet, from want of means and encouragement, been in actual operation, it is worked out in full size, as far as the mechanical part is concerned. It is greatly to be regretted that so much ingenuity should not meet with encouragement, so far as to render the expense already incurred available, and perfect the machine sufficiently for actual trial. The drawings I exhibit show the arrangement of the whole machine. The next and last of these machines which I wish to notice is the steam plough of Mr. James Usher, brewer, Edinburgh, of which, through his kindness, I am able to exhibit the beautiful model sent to the Crystal Palace in 1851, with complete working drawings. This implement has been worked up by Mr. Slight, the practical mechanician, and was put to work near Edinburgh, at Niddrie, last season. The working model before you will save some description, as the 12 ploughshares and coulters, upon four frames fixed to the axle, revolving by the steam power, can be actually worked in the bed of damp sand prepared for them. These ploughshares succeed one another, and can be placed close enough to tear up every particle of soil. The engine is moved over the soil by a broad roller revolving by the power, while the entrance of the successive scarifiers assists materially to drag it forward. It must strike every one who studies its motion as a very beautiful and successful application of the rotatory principle to tillage. In this application there is no doubt we must at once recognise a variety of operation from that we are accustomed to. It will not turn over the soil in the way our plough does. In fact, in breaking up lea, the turf must be broken, harrowed, and gathered in preparing it for a crop. Whether this can be satisfactorily accomplished at the season we require it remains to be seen; and what could be done with the vegetable mass which would accumulate from two-year-old lea if such a rotation were persevered in? but it cannot be denied that the present system of burying and rotting is not in itself a perfect operation either. This machine can of course have a roller and sowing box attached to it if desired; it is turned by the engine at the end of the ridge, and on nearly level land appears calculated to be successfully used in farming on a large scale. It is calculated by its inventor to plough at the rate of 3*s.* per acre. It has been regarded very favourably by practical men, and the resolution proposed by Mr. Dudgeon, and carried unanimously by the Kelso Farmers' Club—preferring any system which would thoroughly act upon the soil, and comminute it to a sufficient depth, to the old system of ploughing—was a distinct approval of the principle. Mr. Usher has commenced another of lighter construction, with all the improvements which experience has suggested. The cost will be under 500*l.*; and I am happy to say he has already obtained subscriptions, in 10*l.* shares, to within 100*l.* of the sum required. I hope our district may afford him some supporters. He has received orders for a machine from Australia, which is already begun; and it would be strange, indeed, if enough could not be raised to give the invention a trial in his own country. Such experiments are most interesting efforts to advance in the course of improvement, and even if they should not, in their original form, prove entirely satisfactory, they seldom fail either of being worked into efficiency, or suggesting kindred applications which may supersede them. I should gladly see a similar sum put at the disposal of Mr. Guthrie, to bring out his very ingenious digger in a working shape. Between the two the perfect form might be obtained, or different circumstances dictate which should be preferably used. In either case, Samuelson's or Romaine's revolving grubber (the latter, I am tempted to believe, like the American reaper, a plagiarism from one of ours) might easily be substituted for the digging cylinder, when desirable, and the roller and sowing-box attached behind.

Miscellaneous.

Use of Portable Manures in East Lothian.—The amount spent on guano in this county is very considerable. There are several farmers who purchase guano annually to the extent of 1000*l.*; and 400*l.* to 600*l.* is a common expenditure. The amount expended on portable manures over the cultivated portion of the county may be taken at 12*s.* to 18*s.* per acre. In one parish, Gladsmuir, of 6386 acres, the quantity of Peruvian guano applied last season was upwards of 400 tons; this year, for the same parish, already 500 tons have been ordered. The produce of the county has been greatly increased since the introduction of guano. Mr. John Brodie is of opinion that guano has increased the average produce of the Wheat crop something like 7 bushels per acre, and of Barley and Oats fully 8 bushels. Thorough draining, with the use of guano, has doubtless greatly raised the aggregate produce. Allowing for seed, and grain paid as wages to servants, with what is consumed by horses, the aggregate produce of vegetable and animal food which this county supplies for general consumption has been certainly doubled within no very distant period—say 20 to 30 years. *From the Report on the Farming of East Lothian, by Mr. Stevenson, in the Eng. Ag. Society's Journal.*

Cod Liver Oil in Fattening Animals.—About two years ago, when on a visit to an intelligent friend residing on his own farm in Essex, and whose attention has been actively directed to the practical application of science to agriculture, it occurred to me to suggest to him the use of cod-liver oil in fattening cattle, stating my belief that it might be possible to obtain by its administration a decided saving in the cost of feeding. I proposed that he should separate off such of his stock as were to be the subject of experiment, and that the weight of the animals, the price obtained, and the outlay for food, should be carefully noted in comparison with others fed in the ordinary manner. The variety of my friend's occupations prevented his giving to my plan the minute attention which could have been desired, and the results of which I had hoped before this to publish; but the following letter from him contains matter of much interest, and, if I mistake not, foundation for future experiment and investigation:—"You ask me to write you some particulars of my experiments upon fattening animals with cod oil. I will not attempt to give you any very minute details, but will endeavour to place before you a general view of what we have done; and as last winter I carried my plans out more fully than the preceding one, I will particularly speak of my operations at that time. And first of pigs. I kept upon an average 300, and killed from 20 to 30 per week, mostly porkers, from 5 to 15 stone weight. The experiments were made by dividing off 20 pigs, and weighing each lot, keeping the meal separate, giving one lot 2 oz. of oil per diem, and both as much meal as they liked. I found the pigs taking the oil ate less meal, weighed the heaviest, and made the most money per stone in the London market, the fat being firm and white. Subsequently I found that for small pigs 1 oz. of oil will do better. To larger pigs I have given a quarter of a pint per diem, and to small pigs also, but I have always found I lost money and credit for good pork when the larger quantity was given, and when killed, the fat was yellow, and the flesh tasted fishy. From the weekly examination of so many pigs, I have concluded that the oil in no case cured a pig troubled with lung disease, but that when given in small quantities it was profitable, as the animal fattened upon a less amount of food, the oil tending to produce fat quickly. My experiments have led me to conclude, that if given in a quantity which cannot be digested, it is then passed over the system in the shape of bile, so as to cause the yellow appearance in the fat. The farmer in such case would lose money, as my man did for me, believing that if so small a quantity were good, more would be better. The result with sheep has been more satisfactory; with one ounce per day the fat has been beautifully white, and the flesh has been compared to short-cake, being light and easy of digestion. The lot of 80 gave general satisfaction to the consumers, but the butchers complained of lighter weight than the healthy well-to-do appearance of the sheep led them to expect. As regards bullocks: last year 10 short-horns took each from a quarter of a pint to three-quarters of a pint daily, and paid better than any other bullocks—those were sold for London. The opinion of all who saw them was, that it was impossible for any beast to go on so well as they did in the usual way with so little food. They commenced with the quarter pint, and ended with three-quarters. I fancied on the whole that they did better on half a pint each per diem. I purchased for an experiment this year eight Herefords, even or regular beasts. They are divided into two lots, one of which has a quarter of a pint of oil daily, and all live alike. The bullocks have the oil mixed up with meal and chaff, the pigs with dry meal, the sheep have split Beans soaked in oil. The commonest cod oil costs from 2*s.* 8*d.* to 3*s.* per gallon. I have tried sperm oil against the cod oil, and prefer the latter. I should add that this year I only use an ounce for sheep and pigs, and four ounces per day for each bullock. The relief to a broken-winded horse from the administration of cod oil is very soon perceptible. I shall be most happy at any time to write to you further upon the subject. *A. W.*"—1. It will be observed that in the

above experiments on pigs, bullocks, and sheep, a greater degree of fattening was obtained from a less amount of food when cod oil was used. 2. That in all the animals there seemed to be a decided limit to the quantity which could be digested; that for pigs being two ounces, the smaller thriving best on one ounce, and the larger hogs being over-fed on four ounces per diem. Sheep took an ounce, and bullocks a quarter to three-quarters of a pint, and paid better than any other bullocks; but in all these cases a much larger quantity was tried experimentally, and it invariably disagreed, producing derangement of digestion, and "causing a yellow appearance of the fat and a fishy taste." This was remarked by the butcher who purchased the animals, and who, at my request, was not informed of the peculiar mode of fattening which was adopted. Whether the above experiments may induce farmers to adopt cod oil as a judicious article of food, more efficacious and cheaper for fattening their stock than those ordinarily used, I will not presume to decide; but I offer the foregoing results to the profession, persuaded of their importance and interest in studying the application and physiological action of oils on the animal system. *Dr. Pollock, Chandos Street, Cavendish Square, in Lancet.*

Reaping Machine. By Dr. Mazier, of Aigle, France.—Patent granted May 11, 1853. (No 1156.)—Claims: 1. The employment of a following-carriage for carrying the cutter and apparatus connected therewith, as described. 2. The method of giving motion to the cutter from the axle by means of a screw and wheel. 3. The employment of a roller in connection with the machine for laying the crop in the right direction to be cut. 4. So arranging reaping-machines that the cutters may be placed on either side of the machine, so as to enable the machine to reap whilst travelling in either direction. *Mechanics' Magazine.*

Wages in East Lothian.—The system of payment is somewhat peculiar, being a species of the truck system. All the hinds upon a farm receive the same "gains." One farmer only varies from another, if at all, to a very limited extent. The "gains" are 72 bushels of Oats, 18 of Barley, and 8 of Beans; keep for a cow, or, in lieu thereof, 5*l.* in money; with about one-tenth of an acre of land for planting Potatoes; house and garden, with liberty to keep a pig; coals driven, and food supplied during harvest. A few farmers also give 2*l.* for Flax and hen money. The keeping of a cow is a source of great convenience to the family, and supplies to them many comforts which they could not otherwise secure. It has also a marked moral effect, as the feeling connected with property generally elevates the tone of the possessor. The system of mutual insurance of the cows is very generally carried out by the hinds, the allowance for a cow being 8*l.*, about 2*l.* below average value. The prevalence of pleuro-pneumonia four years ago has, however, very generally interfered with the working of these insurances. For the above items the hind gives his entire services (the period of work in the fields being nine hours), furnishes a reaper, without wages, in harvest for 21 days, and, where such a stipulation exists, also an outworker, generally a female, termed a "bondager," who, when employed, receives 10*d.* per day. The system of "bondager" has been loudly complained of by the hinds, and, from a general representation, this part of the engagement is now relaxed—many farmers not insisting on this provision, and trusting for the supply of labour to the families of the hinds, cottagers, and the itinerant Irish. *From the Report on the Farming of East Lothian, by Mr. Stevenson.*

Calendar of Operations.

JUNE.

South Devon, *June* 20.—We have lately had sufficient rain, but the weather cannot be called satisfactory, cold winds and cold nights having much retarded the growth of Grass and crops generally. The Turnip crop now claims the most attention, and all parties are busy working and manuring for it, the general system being to plough down the dung, and drill phosphate of lime and guano with the seed, in the proportion of 2 cwt. of the former to 1 cwt. of the latter; there is not, however, much sown as yet. The Mangold Wurzel crop has now generally made its appearance above ground, and in some places been singled: present appearances do not, however, enable one to speak very favourably of its success as a crop this year; there is an irregularity in the coming up which does not look well; still warm genial weather may yet do much for it. The Wheat crop, although thin in the ground, looks healthy. Barley and Oats at present promise well. The Potato crop never looked better and more free from disease. With regard to the hay crops, reports are not so favourable; Clover will decidedly be very slight and meadow as well, unless the late showers of rain and warmer weather bring up more of the bottom Grass. Sheep shearing has become general, and in some places nearly finished. Although an Apple growing county, we cannot boast of our produce this year, notwithstanding the splendid show of blossom; in most instances the fruit after setting well has dropped off from blight, no doubt caused by the cold winds. We may quote fat cattle still well up:—Beef, from 60*s.* to 63*s.* per cwt.; sheep, from 6*d.* to 7*d.* per lb.; lambs, from 6½*d.* to 7*d.* per lb.; calves, from 5½*d.* to 6*d.* per lb. Corn is dull at the following prices per quarter:—Wheat, 84*s.*; Barley, 38*s.*; and Oats, 28*s.*

Notices to Correspondents.

Dairy Management: *T. S.* Next week.—*W. A.* Cuthbert Johnson's little book, published by Ridgway, may serve your purpose.

Land Agency: *Strignil.* Professor Low's work on the management of landed property is the best on the subject. But the thing must be seen and done—not merely studied in books, in order that you may attain efficiency. We do not happen to know Weale's book on the subject.

Management of Small Farm: *J. L. B.* You are quite right; the details are absurd. See a notice last week.

Weeds: *Warwickshire Sub* and *Enfield.* It is a common idea that pasturing with geese will ultimately destroy Buttercups. We fear that the only way is to remove them bodily by weeding irons. Dandelions must be removed in the same way. They are both injurious, in so far as they occupy the ground to the exclusion of better plants.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. Archer, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

NEW OAT CRUSHERS, 2*l.* 15*s.* 6*d.*; do., 4*l.* 5*s.* 6*d.* CHAFF CUTTERS, 1*l.* 7*s.* 6*d.*; do., 2*l.* 19*s.* 6*d.* MANGLES, 2*l.* 10*s.* 6*d.* FLOUR MILLS, 4*l.* 10*s.* 6*d.*

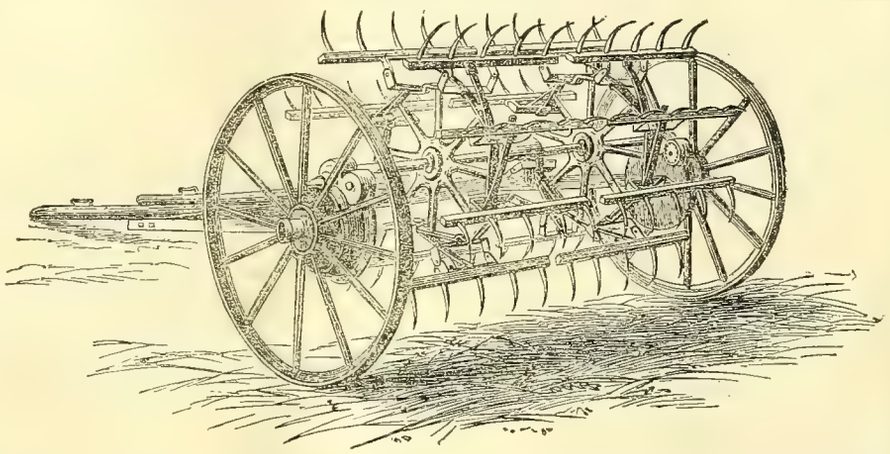
MARY WEDLAKE & CO., 118, Fenchurch Street, London.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement J. B. White & Brothers, Millbank Street, Westminster.



WEDLAKE'S CELEBRATED HAY-MAKING MACHINE
(ORIGINAL PATENT),

Recently improved so as not to clog, and which obtained the Silver Medal at Derby; manufactured by the Daughter of the Inventor, not complicated, and unequalled for simplicity of construction. Order immediately, so as not to be disappointed in the season, and to get them now at one-fourth of the price usually charged in June and July.

☞ Beware of spurious Machines offered by unprincipled traders as Mary Wedlake & Co.'s.

WEDLAKE'S NEW HORSE HAY RAKE AND DRAG,
EQUALLY USEFUL FOR STUBBLE, CORN, AND GREEN CROPS.
Only £3 10*s.* 6*d.*, width six feet; the Double Size, £9 10*s.* Order early.

WEDLAKE'S
DOUBLE HORSE, HAY, AND STUBBLE RAKE,
DOING THE WORK OF 10 TO 15 WOMEN. Price £10, and £3 10*s.* 6*d.*,
Both Implements recommended by Mr. J. Morton, in the new "Cyclopedia of Agriculture;" also
OAT CRUSHERS, £2 15*s.* 6*d.*
118, FENCHURCH STREET, CITY.

Just published, price One Shilling and Sixpence,
HOW TO MAKE HAY IN THREE DAYS,
AND AT ONE-HALF OF THE USUAL EXPENSE, IN ANY COUNTY AND WEATHER; Or, HINTS TO HAYMAKERS
ALSO,
How to Keep a Horse for less than 9s. per Week.
118, FENCHURCH STREET, CITY.

COTTAM AND HALLEN,
2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.

APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.
AGRICULTURAL LIST UPON APPLICATION.
EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.
EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain who on application will forward wholesale and retail prices.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, ETC.

JAMES LYNE HANCOCK'S VULCANISED INDIA-RUBBER TUBING is now manufactured especially for the above purposes, and is of greater flexibility than any other description of hose or tubing. It is also manufactured to resist great pressure, suitable for attaching to the mains of water works or to tanks, or water butts of high elevations. WATERING HOSE fitted up with brass joints, branches, stop-cocks, roses, and jets complete. Vulcanised India-rubber suction pipes for pumps any length or size to order; HOSE for brewers' use, fire engines, &c. VULCANISED INDIA-RUBBER WASHERS, for Steam and Water Joints, and VULCANISED RUBBER in sheets of any size and thickness. Solid vulcanised India-rubber Tubing and Cord, for the joints of glass-doors, sashes, frames, &c.—Prices and every information may be had on application at the Manufactory, Goswell Mews, Goswell Road.

WEIR'S IRRIGATORS, LIQUID MANURE PUMPS, FIRE AND GARDEN ENGINES.

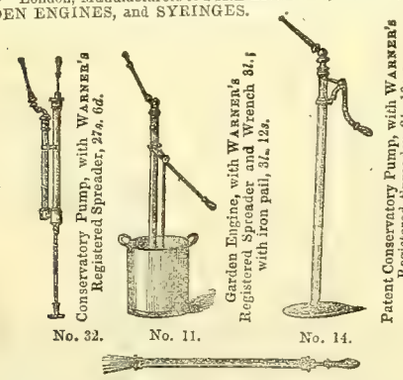
EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London, removed from Oxford Street.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.



Conservatory Pump, with WARNER'S Registered Spreader, 27s. 6d.
Garden Engine, with WARNER'S Registered Spreader and Wrench 31.; with iron pail, 3l. 12s.
Patent Conservatory Pump, with WARNER'S Registered Spreader, 2l. 13s.; with iron pail, 3l. 5s.
No. 32.
No. 11.
No. 14.

Brass Syringes, 9s. to 18s.

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

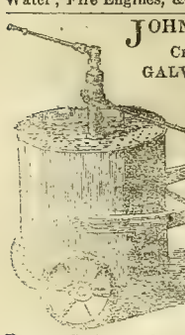
The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.



JOHN WARNER AND SONS,

CRESCENT, JEWIN STREET, LONDON.

GALVANISED IRON TUB GARDEN ENGINE,

With Warner's Registered Spreader,

Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

(Fig. 1.)

(Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 14	„	30	„	„	45	„	...	5 18

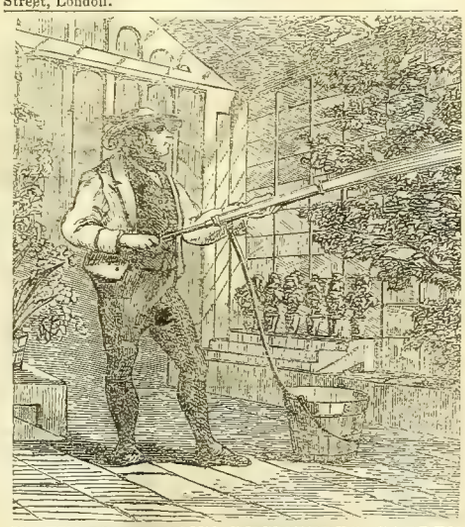
A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.



J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

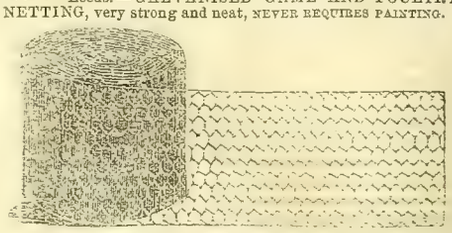
By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

H. J. MORTON AND CO., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.

24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.

GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.

Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

H. J. MORTON AND CO., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

PATENT WIRE STRAND FENCING FOR PARKS, &c.

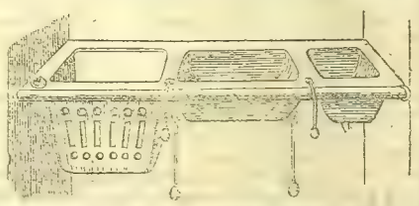
This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

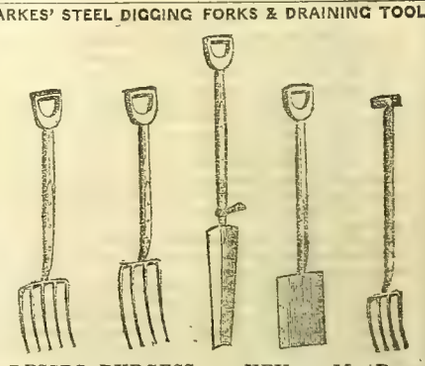
PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, HYDRAULIC ENGINEER, 70, Strand, and Bridgefield, Wandsworth.

BARTON'S PATENT STABLE FITTINGS, AND ENAMELLED MANGERS.



THESE FITTINGS have all the newest improvements and are the only patented invention of this description. Also Improved Stable Fittings with Rack, Manger, and Water Trough attached, New Pattern Manger and Water Trough combined; Corner and Straight Mangers, Plain, Enamelled, and Galvanised; Stable Furniture of every description, Iron Gates, Railing, Hurdles, Sheep and Game Wire Netting, Registered Poultry Troughs, Fountains, Feeders, &c.—JAMES BARTON, IRONFOUNDER, SMITH, &c., 370, Oxford Street, a few doors east of the Pantheon.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



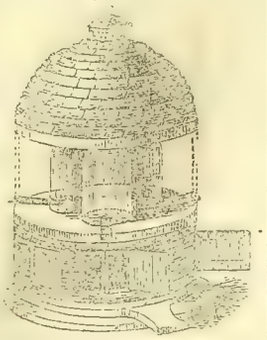
MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally oduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.



This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, F. & A. DICKSON & SONS, 106, Eastgate Street; Glasgow, AUSTEN & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening Pursuits, are invited to examine DEANE, DRAY, AND CO.'s extensive Stock of GARDENING and PRUNING IMPLEMENTS, best London-made Garden Engines and Syringes, Colebrook Dale Garden Seats and Chairs.

JAMES PHILLIPS & Co.,
116, BISHOPSGATE STREET WITHOUT.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

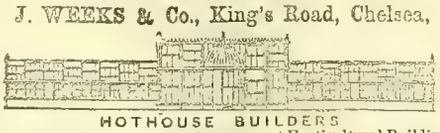
"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER, and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, begs to solicit the attention of the Gentry to his prices for cash. Good substantially built Greenhouses, fixed in any part of the kingdom, 42 feet long, 13 feet wide, 90*l.*; 21 feet by 13 feet, 50*l.*; 12½ feet by 10 feet, 30*l.* A large assortment of Melon and Cucumber boxes, summer houses, &c. Estimates for any branch in the above line either in iron or wood, or park fencing.

HORTICULTURE IN ALL ITS BRANCHES.

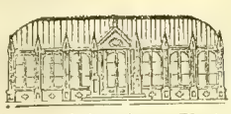
J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.



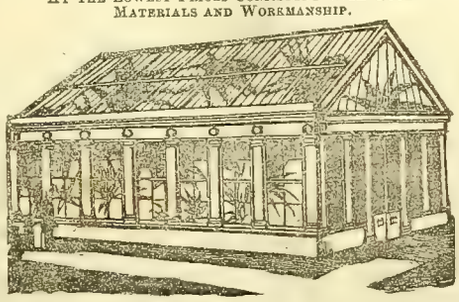
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

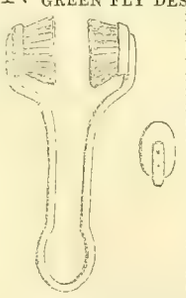
GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS. and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

IMPORTANT TO GROWERS OF ROSES.

NEWLY-INVENTED APHIS BRUSH, OR GREEN FLY DESTROYER.—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the Rev. E. S. BULL, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage. Price 2*s.* 6*d.* each.



MANUFACTURED BY

JOSLIN AND SONS,
IRONMONGERS, Colchester.

Retailed by all the principal Ironmongers.

Wholesale agents: W. Thompson and Son, 15, Upper North Place, Gray's Inn Lane Road, London.

BERDOE'S VENTILATING WATERPROOF LIGHT OVER-COATS resist any amount of rain, without confining perspiration, the fatal objection to all other waterproofs, air-tight materials being unfit and dangerous for clothing, and being free from vulgar singularity are adapted for general use equally as for rainy weather. Price 45*s.* and 50*s.* A large stock for selection. Also of Capes, Shooting Jackets, Ladies' Mantles, Habits, &c.—W. BERDOE, Tailor, &c., 96, New Bond-street, and 69, Cornhill (only).

TO NURSERYMEN AND OTHERS.

TO BE LET, a SMALL NURSERY, in a very excellent situation, consisting of a well-stocked Garden and Greenhouses, to be Sold a bargain, in consequence of the party going abroad. For particulars enquire of Mr. HOOPER, Grand Row, Covent Garden, London.

TO BE LET, A FARM, IN SURREY.—Mr. EDWARD RYDE, Surveyor, is instructed to Let, with immediate possession (if desired), a very eligible and compact FARM, containing about 180 acres of good Arable, Meadow, and Hop Land; situate in the parish of Farnham, close to the Railway Station and (market) Town. The House is a good one, and there is, in addition, a Bailiff's Residence and several Labourers' Cottages, which, considered in connection with the economy and facility of Railway communication with the Metropolis, render it equally attractive to the Gentleman seeking a pleasure Farm as to the practical Agriculturist.—Further particulars may be obtained of Mr. RYDE, at his Estate, Auction, and Agency Offices, 14, Upper Belgrave Place, Pimlico; and of Messrs. RYDE & LILLYWHITE, Auctioneers, Alton, Hants.

KINGSCLERE, FIVE MILES FROM NEWBURY.

TO BE SOLD, by Private Contract, a very desirable small FREEHOLD FARM, exonerated from Land Tax comprising a complete comfortable Farm-house, suitable Farm Buildings, Yards, Garden and Orchard, and about 50 acres of Land, of which 3 acres are Meadow, 2 Wood, and the remainder arable. — To treat, apply to Mr. CORNELIUS B. DAVIS, Land-Surveyor, The Hitchen, East Woodhay.

TO FLORISTS, ETC.

TO BE SOLD, the LEASE, for the unexpired term of 10 years, of the Manor Nursery, Shacklewell Green, West Hackney. It contains one acre of Ground, two good six-roomed Dwelling Houses, ten Greenhouses, Sheds, &c., and well supplied with water. Any person wishing for a compact Nursery for the culture of plants in pots will find this a very advantageous opportunity.—For particulars, apply to F. J. BUCK, at the above-named Nursery.

HOLYBOURNE, NEAR ALTON.

TO BE SOLD, a small compact BREWERY, Malt-house, Mill, Residence, and Cottage, with Garden, Orchard, and Meadow-land adjoining, containing in all five acres, more or less. The premises are situated close to the London-road, and within a mile of the Alton Railway station.—For particulars apply to Mr. DYER, Alton.

FOR SALE, a FIRE or GARDEN ENGINE, of great power, superior make, and very compact, throwing water above 50 feet high, at the rate of 60 gallons a minute. Enquire of Mr. MART, 130, Oxford Street; or it may be seen at Mr. Porter's, opposite the Forest Hill Station, Sydenham, Kent.

---

100 ALDERNEY COWS AND HEIFERS.

JAMES DUMBRELL respectfully invites purchasers of Alderney Cows to inspect his stock. Choice from 100.

JAMES DUMBRELL, Ditchling, Hurstperpoint, Sussex, one mile from Hassock's Gate Station, London and Brighton Railway.

COCHIN CHINA POULTRY, ETC.

Prospectuses may be had through all Booksellers; and of the Proprietor, JOHN E. SOWERBY, 3, Mead Place, Lambeth.

Just published, price One Shilling and Sixpence, the Sixth Edition of
FLORA AND POMONA'S FETE. A POEM. By ELIZABETH STEELE PERKINS. The proceeds are devoted towards the funds of the proposed new church on the Coldfield in the parish of Sutton.
London: SIMPKIN, MARSHALL, & Co.; and THOMPSON, Tamworth.

ON MARRIAGE.
Just published (to be had free, by enclosing 1s. or Twelve Postage Stamps, to Mr. WATSON, Clerical Agent, Robert Street, Adelphi, London).
MATRIMONY.—A Pamphlet on Matrimonial Alliances, which merits the attention of those who wish to settle honourably in life. By a Clergyman.

HER MOST GRACIOUS MAJESTY
HAVING COMMANDED
MR. BARKER'S PICTURE OF NAPOLEON THE GREAT REBUKING HIS OFFICERS ON THE BATTLE FIELD OF BASSANO to be sent to Buckingham Palace, on Saturday (this day), Messrs. LEGGATT, HAYWARD, & LEGGATT announce to those who have received Cards of Invitation to inspect it, that the PAINTING CANNOT BE SEEN until MONDAY, JUNE 26th, at mid-day.

D. FERGUSON, LANDSCAPE GARDENER and CONTRACTING PLANTER, Stowe, Buckingham, still has about 40,000 Geraniums, Calceolarias, Verbenas, Heliotropes, Fuchsias, Lobelias, Salvias, &c. &c.; they are well rooted and established, and if left to his selection, will be sent out at the usual price of 1s. 6d. per dozen, if 10 dozen are taken; 1s. 3d. per dozen, if 20 dozen are taken; 1s. per dozen, if 50 dozen are taken; 5 dozen added if 100 dozen are taken.—Carriage free, or deducted, to all Railway Stations in Britain, to Dublin, Paris, and Amsterdam.

MR. GLENNY requests that REPORTS of all the HORTICULTURAL and FLORAL EXHIBITIONS may be sent to him for publication, and that specimens of Fruit, Flowers, Plants, and Vegetables, as well as other subjects for his opinion, may be addressed, Mr. GLENNY, 420, Strand.

JAMES ANDREWS, FLORICULTURAL & HORTICULTURAL ARTIST, 9, West Street, Walworth Road, Surrey, begs to inform Florists, Amateurs, and the Public, he undertakes to give faithful DRAWINGS in Water Colours of FRUITS, FLOWERS, or VEGETABLES, and hopes to meet with that patronage which it shall be his constant study to deserve.
J. A. can, after a drawing has been made, furnish any quantity (not less than 100) of Coloured Plates, fac-similes of the original, with advertisement at the foot of each for distribution to the trade, at estimated prices, and would refer to the *Florist and Garden Miscellany* for specimens.

TO FLORISTS AND OTHERS.
J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

FLOWER-POTS, of a very superior manufacture, delivered at the Bricklayers' Arms Terminus, and other Stations on the Dover Railway, in quantities of not less than 100 casts, at 1s. 9d. per cast.—Apply to the South-Eastern Potteries, Marden, Kent.

PROTOXIDE ANTI-CORROSION PAINT, for all external purposes, on iron, wood, brickwork, or stucco, is cheaper, and more durable, than any similar article.—Manufactured by CHARLES FRANCIS & SONS, Cement Works, Nine Elms, London.

MILDEW AND RED SPIDER.
BAINBRIDGE'S ALKALINE EXTRACT.—We can confidently recommend the above as a sure remedy, having used it successfully for many years both on Vines and Peaches, &c. &c. Pints, 3s.; quarts, 5s. A quart is sufficient for 20 gallons of water applied with the Syringe.
BAINBRIDGE'S GUIDE TO THE CONSERVATORY, 5s. each. Sold wholesale and retail by R. BALDWIN, Paternoster Row. Gentlemen can procure the above in any part of the country through their Bookseller, in their Monthly parcels.
Sold also by BAINBRIDGE & HEWISON, 7, Bridge Street, York.

THE GRAPE BLIGHT.
McADAM'S "COMPOSITION" (now used in the Royal Vineries), for the effectual prevention and cure of the Vine Mildew, is sold in 1 lb. packets, with printed directions, at 3s. 6d. each, sufficient for 18 gallons of wash.
DAWE, COTTRELL, & BENHAM, Seedsmen, London Agents, 36, Moorgate Street, City. It may be ordered through any respectable Nurseryman or Tradesman in town or country.

PAGE AND CO.'S COMPOSITION FOR THE DESTRUCTION OF MILDEW UPON VINES, BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, AND STOVE AND GREENHOUSE PLANTS.—Extra strong, 4s. per gallon, sufficient to make four (jars and barrels extra); in bottles, 1s. 3d. and 2s. 6d. each. 10 gallons and upwards carriage free to London. Directions for use and copies of testimonials upon application. For testimonials see whole page *Gardeners' Chronicle*, March 11, 1854, describing the SATISFACTORY RESULTS derived from its use in cases of Vine Mildew, Thrip, Scale, Green Fly, Red Spider, Mealy Bug, &c., not only without injuring the most delicate flowers or foliage, but promotes a vigorous growth; it is highly appreciated at the Royal Gardens, Osborne Palace, the Royal Gardens, Claremont, and by the principal nobility and gentry in the United Kingdom.
Finest Grasses for Lawns and Parks, and every variety of Garden and Farm Seeds, at B. PAGE & Co.'s, Seed Merchants, Oxford Street, Southampton.

COWS.
HARVEY'S CELEBRATED COW DRINKS, 1s. each. They have been used with unparalleled success in most diseases incidental to Cows. Full and plain directions are given with each drink for the treatment of Hoven, Mawbound, Colds, Gargle, Red Water, the Tick or Foot and Mouth Distemper, at and after Calving, &c. A very extensive use of these drinks has proved them to be a safe and effectual remedy.
Compounded by R. HARVEY, Veterinary Surgeon, Macclesfield, Cheshire, and sold by all Medicine Vendors. Wholesale Agents, BARCLAY & SONS, Farringdon Street; and MARSDEN & SONS, Queen Street, Cheapside, London.

SHEEP, LAMBS, HORSES, AND CATTLE,
CAN BE DRESSED WITH
LONG'S NON-POISONOUS SHEEP & CATTLE-DRESSING COMPOSITIONS, without any possibility of danger or injury resulting from the application. These Compositions are admitted by all who have fairly tested them to be the most effective Sheep Dressings ever brought before the agricultural public; and as they are NON-POISONOUS, and do not stain or discolour the Wool, they are gradually superseding the use of all Dipping and other Sheep-dressing preparations, composed of such deadly poisons as ARSENIC or MERCURY.
It is a fact now thoroughly established, that Long's Non-Poisonous Sheep Dressings, if liberally and judiciously applied in the dressing of Sheep and Lambs, will—in their consequent effect in removing Disease, destroying Vermin, and keeping the flock in condition—thus PROMOTING INCREASED GROWTH BOTH OF MUTTON AND WOOL—as amply repay flock owners for first outlay, as artificial manures when applied to land. They are the only Sheep-Dressings also, which, from the fact of their containing NO POISON, can be beneficially and safely applied to Sheep and Lambs at any age and at any season of the year.
Pamphlets containing full directions for use, and copies of the strongest Testimonials ever accorded to a manufacturer, signed by leading and practical Stock Farmers, residing in all parts of the United Kingdom, together with the names of all Country Agents authorised to vend Long's Patent Sheep and Cattle-dressing Compositions, may be obtained gratuitously on application of any advertised country Agent; or by post, sent free, of
BARRY BROTHERS, AGENTS FOR JOSEPH LONG, Meriton's Wharf, and Shad Thames, London.

THE CHOLERA
PREVENTED BY THE DESTRUCTION OF ALL NOXIOUS EFFLUVIA.
CREWS'S DISINFECTING FLUID, Recommended by the College of Physicians. The Cheapest and Strongest Chloride of Zinc.—Quarts, 2s.; Pints, 1s.; Half-pints, 6d. Sold by all Chemists, Druggists, and Shipping Agents; and at Commercial Wharf, Mile End, London.

THE CHOLERA—ITS BEST ANTIDOTE.
SIR W. BURNET'S DISINFECTING FLUID, the original and genuine CHLORIDE OF ZINC.—Sold by all Chemists, Druggists, and Shipping Agents; and at the Office, 18, Cannon Street, London Bridge.
N.B. Beware of a spurious and low-priced imitation.

SEA-BATHING, HAYLING ISLAND, approached from Havant by a bridge, five miles from Portsmouth.—THE ROYAL HOTEL and FAMILY BOARDING HOUSE. Rooms facing the Sea; opposite the Isle of Wight, &c. Conveyances to meet the Trains, by previous application to C. LELLYETT, the Dolphin Commercial Inn and Posting House, Havant, Hants.

DEVONSHIRE CYDER.—A three dozen case (large bottles), of the very best DEVONSHIRE CHAMPAGNE CYDER, will be forwarded to any address on receipt of a Post-office order for 21s., payable to JOHN E. RENDLE, Martin Street, Octagon, Plymouth. Case and bottles, value 9s., included.

GLENFIELD PATENT STARCH, used in her Majesty's Laundry, and WOTHERSPOON'S machine-made CONFECTIONARY, MARMALADE, JAMS, JELLIES, &c., which gained the Prize Medal of 1851, may be had of all Grocers; Wholesale of WOTHERSPOON, MACKAY, & Co., 66, Queen Street, Cheapside, London; and ROBERT WOTHERSPOON & Co., Glasgow.

BRECKNELL'S SKIN SOAP.—Recommended as the best for producing a clear and healthy skin, being the OLD YELLOW SOAP, made expressly for the purpose, of the best materials and not scented. Sold only in Shilling Packets, of either four rounded tablets or eight squares.—Observe each tablet and square is stamped "Brecknell's Skin Soap."
BRECKNELL, TURNER, & SONS, Wax and Tallow Chandlers, Soap and Oil Merchants, &c., to Her Majesty, Beehive, 31, Haymarket.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church Row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, JUNE 24, 1854.

HORTICULTURAL SOCIETY OF LONDON.—HIS GRACE THE PRESIDENT has kindly directed the Grounds of Chiswick House to be opened for the reception of the Visitors to the Society's Gardens at the NEXT EXHIBITION, on SATURDAY, the 8th JULY. Tickets are issued at this Office, price 5s.; or at the Garden, in the afternoon of the 8th July, at 7s. 6d. each.—21, REGENT STREET, LONDON.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The last Exhibition this season of PLANTS, FLOWERS, and FRUIT, will take place on WEDNESDAY next, July 5.

Tickets of Admission can be obtained at the Gardens by orders from Fellows of the Society, price 5s., or on the day of the Exhibition, 7s. 6d. each.

KENILWORTH.—A Grand HORTICULTURAL and FLORICULTURAL EXHIBITION will be held (by permission) among the RUINS OF KENILWORTH CASTLE, on WEDNESDAY, July 5, when Prizes to the amount of nearly 80l. will be awarded for collections and single specimens of Stove and Greenhouse Plants, Cut Flowers, Fruits, Vegetables, &c. This Exhibition will be open to all Exhibitors without entrance fee, limitation, or other restriction, subject only to such conditions as seem necessary to secure order and equal opportunity of reward and distinction to all competitors.

Schedules and every particular may be had on application to J. CHEYNE, Secretary, Offchurch, near Leamington Spa.

BEDFORD AND BEDFORDSHIRE HORTICULTURAL AND FLORICULTURAL SOCIETY.—The SUMMER EXHIBITION of the above Society will take place at the ASSEMBLY ROOMS, Bedford, on TUESDAY, July 11, when Prizes for PLANTS, CUT FLOWERS, &c., will be awarded. There will be a Sweepstakes for the undermentioned Plants and Cut Flowers, Open to all England. Entrance to each class, 5s.

For the best 6 Fuchsias, distinct varieties.
For the best 6 Geraniums, distinct varieties.
For the best 24 Cut Roses, in single blooms, distinct varieties.
For the greatest number of vars. of Cut Roses in single blooms.
For the best 24 Verbenas, distinct varieties, in single trusses.
For the greatest number of varieties of Verbenas, in single trusses.
For the best 12 Sweet Williams, distinct varieties.
For the greatest number of varieties of Sweet William.

The First Prize to be two-thirds of the total amount subscribed for entries; and the Second Prize to be one-third part.

Entries to be made to the Secretary, on or before July 8.

Parties who cannot attend can send their Plants and Flowers addressed to the Secretary (carriage paid), and they will receive every attention.

St. Mary's, Bedford. C. STAFFORD, Hon. Sec.

EAST AND WEST KENT GRAND HORTICULTURAL EXHIBITION AND MUSICAL PROMENADE, under the distinguished patronage of the Right Hon. EARL and COUNTESS of WINCHILSEA, and the nobility of the neighbourhood, in the HORTICULTURAL GROUNDS adjoining the Station, at ASHFORD, on TUESDAY, July 11. Prizes Open to All England. The Royal Artillery Bands of Woolwich will attend. The Orchestra will consist of upwards of 80 Performers, under the direction of Mr. Smythe. A List of Prizes, &c., may be had of the Secretary, W. KEMSLEY.

The Gardens will be opened for admission at half-past 12 o'clock, upon presenting a Ticket, or payment of 2s. 6d.; at half-past 1 o'clock, 2s.; and at 4 o'clock, 1s. Cantelo's Hydro-incubator will be on the grounds. Refreshments supplied in the gardens. The Horticultural arrangements are under the direction of Mr. W. J. Epps, Maidstone and Ashford.

NOTICE.

SOUTH-EASTERN RAILWAY.—The DIRECTORS have kindly consented to CONVEY ALL PERSONS visiting the GRAND HORTICULTURAL EXHIBITION and MUSICAL PROMENADE at ASHFORD, on TUESDAY, July 11, at SINGLE FARES to and from ALL STATIONS on their Line of Railway.

PLANTS OF CABBAGE, SAVOY, KALE, BROCCOLI, CAULIFLOWER, AND CELERY.

JOHN CATTELL, Westerham, Kent, begs respectfully to inform the public that he has a plentiful supply of Plants of his superior true sorts of the above, which will be forwarded to order on receipt of Postage Stamps or Post Office Order made payable here at the following prices, package included:—All the sorts of Early Cabbage, Savoy, and Kale, including Brussels Sprouts, 6d. per 100; 4s. 6d. per 1000. All the sorts of Autumn and Spring Broccoli, and all the sorts of Celery, 8d. per 100; 5s. 6d. per 1000. Cauliflower, Early and Late, 10d. per 100. Red Cabbage, 1s. per 100; Drumhead, or Cattle Cabbage, 4s. per 1000. Packages of 1000 and upwards delivered free of Carriage to London, and to the Edenbridge Station of the South Eastern Rail.

Seed of Cattell's Dwarf Barnes, and of his superior Dwarf Reliance Cabbage, may be had in packets by post for 12 Penny Stamps per packet; the former containing one ounce as usual, and the latter half an ounce.

THE BEST SUBSTITUTE FOR SWEDES.

SUTTON'S PURPLE-TOPPED YELLOW HYBRID, the hardiest, largest, and most nutritious of all Hybrid Turnips. Price 1s. 4d. per lb., or 8s. per gallon.

The best time for sowing this sort is during the first two or three weeks of July.—SUTTON & SONS, Seed Growers, Reading.

CHIVAS'S ORANGE JELLY TURNIP.

SUTTON AND SONS, Seed Growers, Reading, can supply new Seed direct from Mr. Chivas at the same price as at Chester; they have also themselves grown some excellent Seed from selected Orange Jelly Turnips raised last year from seed received of Mr. Chivas, which they can strongly recommend. Purchasers of large quantities will be supplied liberally. Particulars on application.—Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

THE FORWARDEST TURNIP KNOWN.

SUTTON'S EARLY SIX WEEKS TURNIP should now be sown for feeding off early. Excellent new Seed 1s. 3d. per pound, or 7s. per gallon.

Mr. K. HICKMAN, of Brompton House, near Newbury, in a letter dated February 1st, says:—

"*I must mention the 'Six Weeks Turnip' as the best sort I have ever seen for earliest and latest sowing. I have grown them several years, and have invariably found them to produce more feed in less time than any other Turnip. I have had them after Wheat of a good size, within six weeks from the time of sowing.*"

N.B. Carriage free, except parcels under 20s. value.—Address, J. SUTTON and SONS, Seed Growers, Reading, Berks.

SUTTON'S GRASS SEEDS.

GRASS SEEDS FOR PRESENT SOWING.—We are receiving very gratifying intelligence of the crops growing from the seeds we have supplied during the last few months. One of our customers (Mr. Joseph Newton) writing us from Biggleswade, on the 15th April, says:—"*The Grass seeds I had from you have convinced our farmers that it is better to have your selected ripe seeds than to use the unripe hay seeds, from the cow-cribs and hay-lofts.*" Having a fine stock, we can still supply seeds, which may be sown now with certainty of success. For prices and other particulars, address

JOHN SUTTON AND SONS, SEED GROWERS, Reading, Berks.

SUTTON'S IMPERIAL CABBAGE. — THE EARLIEST SORT IN CULTIVATION, large and fine flavour. This sort may be sown immediately without any risk of the plants running to seed. Price 1s. per ounce, post free.

JOHN SUTTON and SONS, Nos. 7 and 8, Market Place, Reading, Berks.

DRUMHEAD CATTLE CABBAGE PLANTS.

JOSEPH SHILLING, NURSERYMAN and SEEDSMAN, Winchester, has a large Stock of the above Plants, which he will send by Railway at 3s. per 1000, package included.

ROBERT PARKER, from MESSRS. A. HENDERSON and Co's., begs to inform his Friends and the Public that he has taken PARADISE NURSERY of Mr. W. J. Pamplin, where he intends to carry on the business of Nurseryman and Seedsman; and assures them that all orders he may be favoured with will be executed with promptitude and care.

Paradise Nursery, Hornsey Road, July 1.

ANEMONES.

JOHN HOADE, FLORIST and SEEDSMAN, Addlestone, near Chertsey, Surrey, begs to offer his first-rate ANEMONE SEED; his collection this Spring is allowed to be equal to anything yet produced for brilliancy and variety. A packet forwarded with printed particulars for sowing and after-culture, on receipt of 13 postage stamps.

NEW ROSES IN POTS.

W. J. EPPS, of Maidstone and Ashford, can now supply fine strong Plants of the following new ROSES. The Plants average from 10 to 20 buds, fit for immediate working.

W. J. E. can offer choice varieties, such as Queen Victoria, Egarie, Triomphe de Valenciennes, Standard de Marengo, L'Ergant Vere, Madame Campbell, Palais de Cristal, &c., at 30s. per dozen, or 2s. 6d. each.

GEORGE DAVIES begs to offer to the Trade the following NEW PLANTS, strong and healthy.

Wistaria sinensis alba, 42s. per dozen, or 16l. per 100.
Prunus sinensis flora pleno, 7s. 6d. each.
Pernettya ciliaris, 30s. per dozen.
Rhodoleia Championi, 60s. per dozen.
Echites Harrisoni, 7s. 6d. each.
Gesnera Donkelaari, 10s. 6d. each.
Acrophyllum venosum, 30s. per dozen.
Daphne Fortuni, 2s. 6d. each.
„ indica rubra, 12s. per dozen.
Cytisus racemosus, superb, 18s. per dozen.
„ onosperma, 3s. 6d. each.
„ filipes, 2s. 6d. each.
Azalea Stanleyana, 7s. 6d. each, or 60s. per dozen.
Gloxinia Wilsoni, 3s. 6d. each.

The two last were sent out by G. D. last autumn, and have given universal satisfaction.

Stanley and Green Lane Nurseries, Old Swan, Liverpool.

CHOICE CINERARIA AND CALCEOLARIA SEEDS.

LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior CINERARIAS AND CALCEOLARIAS, which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias and Calceolarias have given for several successive years enables them to recommend their Seed of the present season with much confidence.

Packets of each, sealed and warranted by them, at 2s. 6d., free by post.—Exeter Nursery, Exeter, July 1.

BEAUTIFUL HARDY PLANT, GYNERIUM ARGENTEUM.

LUCOMBE, PINCE, AND CO. have now for sale a few strong established specimens of this highly ornamental plant. The leaves, which are more than 6 feet in length, grow in tussocks, thereby producing a very fine effect, and from the midst of these numerous flower-stems arise to the height of from 6 to 8 feet, surmounted by graceful panicles of inflorescence nearly 2 feet long, which resemble beautiful waving plumes of silvery feathers; few plants are more elegant than this gigantic Grass, which, being perfectly hardy, is certainly a great acquisition to the ornamental grounds of this country, and it is also exceedingly easy of culture.

Size and price may be had on application to L., P., & Co., Exeter Nursery, Exeter.—July 1.

CINERARIA SEED.

EDWARD GEORGE HENDERSON AND SON, Wellington Nursery, St. John's Wood, London, are now prepared to forward, by post, new Cineraria Seed saved this season. More than usual care has been bestowed in gathering from the choicest named varieties, including the new ones sent out last year; all the light varieties have been discarded, consequently from the above seed we anticipate none but high coloured flowers. Per packet, 2s. 6d. and 5s. each.

Our beautiful collection of CALCEOLARIAS can now be seen in flower at the Nursery, and orders for seed booked, to be sent when ready. Per packet, first quality, 5s.; second quality, 2s. 6d.

WILLIAM WOOD AND SON beg leave to intimate that their extensive Plantations of ROSES are now coming into fine bloom, and will remain in perfection during the Rose season. Maresfield is distant from Lewes 10 miles, and Hayward's Heath 12, both of which places are Stations on the London and Brighton Railway, and from whence conveyances may be obtained.

S. WALTERS' NEW PETUNIAS, now in bloom, possess novelty and quality, which is so desirable in new plants. Amazon, Picturata, Sappho, Silver Queen, and Rosa Superba, 2s. 6d. each. New and choice Geraniums, 21s. per dozen. Fancy Geraniums, 6s. to 9s. per dozen. See *Gardeners' Chronicle*, page 250. The plants are fine and well eyed, and to make stock.

Also, to be disposed of, about 100 Providence, Queen, and other successional Pine-apple Plants in good growth. Price, and other particulars, on application.

Hilperton and Trowbridge Nurseries, Wilts.

PINK.

NORMAN'S COLCHESTER CARDINAL.—For Sale, about 500 Pipings of this splendid PINK, which received a First Class Certificate from the National Floricultural Society, July 1st, 1852, and was designated as—Purple, fine leaf; large and full; fine pod, and best of its class; and figured in the October number of the "Florist." Four pairs, 5s.; 25 pairs 20s.; including package and postage, on receipt of Post-office order or stamps.—Address, Mr. ROBERT HALLS, High Street Colchester, Essex.

NEW GREEN EDGE AURICULA—LORD PALMERSTON.

ROBERT BAIN, SEEDSMAN and FLORIST, begs to announce that he has purchased the entire stock of the above superb flower, from Mr. Campbell, Falkirk, the raiser, and is now sending out fine plants at 21s. each.

It is a cross between Booth's "Freedom" and Yates Morris "Green Hero." It partakes most of the style of "Freedom," but is quite distinct, very constant in flowering, and of a fine habit.

The following is the opinion of Mr. Wood, Editor of the "Midland Florist," in the June number, under the initials "R. R.:"—"Lord PALMERSTON: A very nice flower, of good form, paste dense, a dark green edge, body colour like black velvet; the edge, ground colour, and paste are well balanced."

Falkirk, July 1.

GOOD FREE-FLOWERING ORCHIDS.

THOMAS JACKSON AND SON beg to offer the following:—Acineta Barkeri, Acropera Loddigesi, Cypripedium insigne, Dendrobium chrysanthum, D. Jenkinsi, D. moschatum, D. nobile, D. Pierardi, D. pulchellum, Epidendrum aurantiacum, E. ciliare, Lælia autumnalis, Lycaste cruenta, L. Skinneri, Maxillaria Harrisoni, M. picta, Oncidium altissimum, O. Cebolleti, O. flexuosum, O. leucochilum, O. macroperum, Phaius albus, P. grandifolius, Rodriguezia planifolia, Stanhopea insignis major, S. oculata, S. tigrina major.

T. J. & SON, having a fine Stock of healthy plants of good Orchids suited for amateurs commencing a collection, will be glad to furnish 12 distinct kinds from the above, selected by T. J. & Son, for 42s.; 12 selected from the above by the purchaser, 63s. Many of the more rare Orchids at equally low prices.

Kingston, near London.

A SPLENDID SIGHT.

WILLIAM NICHOLSON respectfully invites his friends and the public to inspect, and test the merits of his STRAWBERRIES—Ajax, Ruby, Captain Cook, and Fillbasket—fine specimens of which may now be seen growing in his gardens, at Egglescliffe, near Yarm, Yorkshire, where may also be seen the following good and approved sorts:—Ingram's Prince of Wales (new), British Queen, Keens' Seedling, Myatt's Surprise, Bicton Pine, Elton Pine, Cuthill's Black Prince, Cuthill's Prince of Wales, Kitley's Goliath, Trollope's Victoria, and others. Also, some very promising seedlings, not yet named, and which will not be sent out till they have been fully approved by competent judges.

W. N. will be much obliged to any of those gentlemen who have favoured him with their orders for his Strawberry Plants, if they will give their candid opinion of their merits, either in the *Gardeners' Chronicle* or by letter.—Egglescliffe, July 1.

SPLENDID NEW RHUBARB.
SALT'S CRIMSON PERFECTION.

ROBERT SALT, GARDENER, Longton, Staffordshire, will send out roots of this early, productive, and delicious variety of Rhubarb this autumn; see *Gardeners' Chronicle* June 11, 1853: "Very good, and most beautiful crimson; compared with others, it is remarkable for the small amount of acidity it contains."

A Certificate of Merit was awarded for specimens exhibited at the meeting of the Horticultural Society, June 28, 1853; likewise a first-class Certificate at Nottingham Horticultural Society, May 24, 1854; and at the Midland do., May 25, 1854.

Single roots, 7*s.* 6*d.*, three for one guinea, and six for 2*l.* Orders forwarded now to ROBERT SALT, or to HURST & M'MULLEN, 6, Leadenhall Street, London: Mr. Wood, Nurseryman, Coppice, near Nottingham; Messrs. Burgess & Kent, Nurserymen, Penkhull, will have the earliest attention. A Post-office order requested from unknown correspondents.—Longton, July 1.

OSBORN AND SONS have the pleasure to acquaint the public that they are now prepared to send out the following new plants:—

OXYLOBIUM OSBORNI.

This beautiful new Oxylobe obtained the Large Silver Medal at the Chiswick Exhibition in June, 1853. From its graceful habit, and bearing its bright orange-coloured flowers in such abundance, it will, we have no doubt, become a general favourite. Price 10*s.* 6*d.* each.

LYSIMACHIA LESCHENAULTI.

An exceedingly pretty plant, with dense heads of pink flowers, raised from seeds received from the Neilgherry Hills; it is a most abundant bloomer, and easy of cultivation. It was awarded the second prize for new plants at the Regent's Park, June 1854. Price 5*s.* each.

PENTAS ROSEA.

A decided improvement on the Pentas carnea, having much darker coloured flowers. Price 3*s.* 6*d.* each. The usual discount to the trade.—Fulham Nursery, near London, June 24.

ELLETSON'S EMPEROR BROCCOLI PLANTS.

E. P. DIXON, 57, Queen Street, Hull, informs his friends and the public, that he can now supply Plants of the above splendid variety, at 3*s.* 6*d.* per 100 (basket included) Early application is necessary.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doosr, Hot-Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

THE
NEW RHODODENDRONS OF ASSAM AND BOOTAN.
COLLECTED BY THOMAS J. BOOTH, ESQ.,
And described in the "Magazine of Botany," by his Uncle, THOMAS NUTTAL, Esq., *of Rainhill, the well-known Botanist and Traveller.*

E. G. HENDERSON & SON

HAVE much pleasure in announcing that they have for Sale these, the most remarkable new species of RHODODENDRONS ever introduced into the country, many of which surpass those from Sikkim, discovered by Dr. Hooker. Amongst these brilliant discoveries from the Bootan Alps are the most wonderful-sized flowers, delicious fragrance, and distinct colours of any that are known to exist in this the most gorgeous tribe of plants; and being combined with magnificent foliage, and distinct habit of growth, will render them indispensable, and a great acquisition both for the garden and conservatory.

The entire Stock of all these extraordinary species now growing (June 16, 1854) in the gardens at Rainhill have been purchased by us. The plants are fine, healthy, and robust. Many have been planted out in the open ground, and have proved quite hardy, with the exception of one or two slightly injured by late spring frosts.

The following six species we are now taking orders for, which will be despatched as soon as the young growth of this season is sufficiently ripened for travelling:—

RHODODENDRON NUTTALI.—(BOOTH).

This distinct and magnificent greenhouse species was discovered on the Duphla Hills, at Meré Patar, about Seram's village, on the banks of the Papoo, growing with Yews and Oaks, at an elevation of 4000 to 5000 feet above the sea-level. Young branches and the under surface of the leaves covered with circular, peltate, radiating, resinous scales, of two kinds — the larger, with expanding leaves, of a bright purple red or pink colour. Young plants but little hairy, compared with those of R. Dalhousiæ. Leaves, 6 to 8 inches long, 2½ to 4 inches wide, of a very thick coriaceous substance, so as to be quite opaque; oval and obtuse, smooth above, except in the young state; very strongly veined and reticulated beneath, and scarcely paler than above; in adult leaves, brown, with the numerous resinous scales. Flower-cone, a little more than 2 inches long, by 2¾ wide; the scales thick and coriaceous, with silky margins internally. Stipules oblong, membranaceous, pink red; corymb four to six-flowered; peduncles, very stout, about 2 inches long in the fruit, less than an inch in the flower; calyx-segments thick and opaque; oblong, oval, or ovate; obtuse; slightly ciliated, and, with the margins, rose-red; an inch in length; enlarging in the fruit, when they become scarcely a third shorter than the capsule. Corolla (or flower) subcampanulate; the border spreading; five-lobed; white, with a tint of rose-red, and yellowish at the base within; 4½ to 5 inches long; fragrant; stamens, ten; the filaments villous below. Style, very long; the stigma, large and capitate; five-lobed. Capsule, light brown; five-celled; about 2 inches long by 1 inch wide; the valves rounded and slightly carinated; placental dissepiments very deep. Seed, very pale brown, or straw colour; ovate, lanceolate, acute, with a wide eroded margin.

This, the largest-flowered Rhododendron known, has foliage larger and handsomer than here described on living plants now in this country; the flowers, resembling those of the Lily, are much larger than the Sikkim Rhododendron (Dalhousiæ). Colour white, with tint of rose-red, and yellow at the base within, and delightfully fragrant. It has been named, in compliment to the veteran botanist and traveller, T. Nuttal, Esq.

RHODODENDRON WINDSORI.—(NUTT).

A fine hardy species, discovered in the mountains of Bootan, on the ridges and slopes of Roophrye, in exposed and arid situations, with Pines, species of Cupressus, Berberis, &c.

Leaves coriaceous, obovate, lanceolate, and acute; 4 to 5 inches long; 1 to 1½ inch broad; strong, reticulated, and pinnately nerved; shining and silvery beneath; at length, pale brown. Heads, many flowered; crowded; the bracts dilated and silky; lobes of the corolla, all emarginate; the colour, a deep crimson scarlet, more beautiful and richer coloured than the Rhododendron arboreum. The calyx is minute; stamens, ten. Capsule at length, smooth, oblique at base, ten-celled.

This splendid coloured garden Rhododendron, of a colour even surpassing the Rhododendron arboreum, will be found invaluable, from its dwarf close-growing habit and large truss.

RHODODENDRON CAMELLIÆFLORUM.—(HOOK. FIL.)

A very curious species, discovered in the valley of Lablung, also on the Bootan Alps; at the latter place growing at an elevation of 9000 to 12,000 feet.

In foliage it resembles Rhododendron Maddeni; 3 to 5 inches long. Flower-stalks, axillary, or terminal, very short and stout. Corolla, sparingly scaly, 1½ inch across; of a very thick texture; pure white, with a faint rosy tinge; all the segments obtuse and entire; the flower strongly resembling that of a single Camellia, from which its name is derived; a very distinct flower from any other Rhododendron.

This remarkable species was discovered by Dr. Hooker; but as no seed or plants ever reached this country in a living state, this is the first opportunity of the plants being purchased.

RHODODENDRON JENKINSI.—(NUTT.)

This distinct species, hardy, or nearly so, with foliage somewhat similar to Rhododendron Maddeni, was discovered in Bootan, on the southern slope of the Oola Mountain, at an elevation of 6000 to 7000 feet above the sea-level, growing a little above Rhododendron Aucklandi; dispersed, and not forming masses, being apparently a scarce species in this locality, accompanied with Pinus excelsa, &c.

A fine shrub, 6 to 7 feet in height, branches covered with a whitish shining bark. Young branches thick, succulent, and of a bright red; leaves coriaceous, and shining above, oblong, lanceolate, and acute, usually cuneate below; 4 to 6½ inches long, 1 to 2 inches broad; beneath, at first glaucous, but at length brown, from a dense clothing of somewhat resinous scales; petioles thick, about three-fourths of an inch long, with the midrib very stout; lateral vessels or ribs nearly hidden in the thick substance of the leaf. Flower-buds large and broad; conic; the scales yellow, thick, and dilated, with membranous margins, all of them smooth, without ciliation. Corymb, from 4 to 6-flowered; peduncles, about three-fourths of an inch long, very thick. Calyx small; the segments nearly all equal, ovate, or oblong, with broadish membranaceous margins. Corolla, not seen; style, about 3 inches long; stigma, large, 10-lobed. Capsule, about an inch long, conic-ovate, woody, and stout; very scaly; 10-celled; each of the partitions of the placental dissepiment longitudinally cleft. Seed, dark brown; lanceolate, subulately acuminate, oblique and pedicellated at the base.

This species, according to a specimen without flower or fruit, in the herbarium of Sir W. Hooker, was also found by the late indefatigable Mr. Griffith, on the Khasya Hills. As a species, it is allied to Rhododendron Maddeni, of Dr. Hooker; and these, along with Rhododendron Sparsiflorum, Nutt., Rhododendron Camelliæflorum, Hook. fil., Rhododendron Lucidum, Nutt., and Rhododendron Calophyllum, Nutt., have a very peculiar aspect, all agreeing in their smooth, lepidote leaves, and succulent texture.

Mr. Booth supposed, from the examination of the buds, that Rhododendron Jenkinsi would have yellow flowers, the specimens having been collected in the month of December. It is named in honour of Major Jenkins, of the East India Service, who has done so much for the botany of that country. If, as it is probable, this species have large yellow flowers, like Rhododendron Maddeni, it will be one of the most distinct Exhibition plants in the tribe.

RHODODENDRON LONGIFOLIUM.—(NUTT.)

A magnificent foliaged plant, discovered in the forest of Bootan, on the slopes of the Oola Mountains, at an elevation of 6500 to 7500 feet above the sea-level; the leaves 12 to 18 inches long; 3 to 5 inches wide in the middle; at first pubescent; at length smooth, or nearly so; gradually narrowed downwards; obovate, lanceolate, silvery, and whitish beneath; strongly reticulated as well as veined; buds, very large. Capsule, 2 inches long, about 1 inch wide, and about 16 celled; oblique at base; transversely wrinkled; at length smooth. Seed, oval or elliptic, with a wide and torn border, light brown. Bud-scales of the leaves nearly smooth. To all appearance, nearly hardy in this climate.

The adult leaves almost resemble those of Magnolia Umbrella. The capsule is larger than that of any other species, if we except that of Rhododendron Nuttali, with flowers, doubtless large, we are unacquainted; it does not show the inner red bud-scales, as in Rhododendron argenteum, to which it is related.

RHODODENDRON KEYSI—(NUTT).

A hardy distinct shrub, growing to the height of 2 or 3 feet, on the mountains of Bootan, at an elevation of 9000 to 10,000 feet above the sea-level, on the summit and northern ridges of the Lablung, forming low thickets, accompanied by Gaultherias and Yews above the range of Rhododendron Hookeri and Rhododendron Falconeri; leaves 2½ to 3 inches long, about an inch wide; opaque; coriaceous, and smooth; lanceolate, or lanceolate-ovate; acute; rounded or narrowed towards the petiole; beneath, as well as the capsule, almost covered with brown circular resinous scales. Corymb, compounded of three or four branchlets, each containing five or six flowers. Calyx, five toothed, small, the teeth nearly equal, and obtuse. Corolla (judging from the withered remains only) tubular or urceolate; the border five-lobed and reflexed; the segments ovate, obtuse. Stamens 10, exerted apparently beyond the corolla; lower half of the filament very hairy or hirsute, as well as the lower half of the style. Anthers, with the usual truncated pores. Capsule, light brown; ovate-cylindric; obtuse. Seeds, dark brown, scarcely subulate, and without the usual margin.

Rather aromatic, from the resinous scales with which the leaves are clad beneath. In its native hills, it grew amidst snows two to three feet in depth. It is allied to Dr. Hooker's Rhododendron vergatum; the flowers, as in that species, axillary, or below the summit of the branch; a shrub very distinct in habit.

One strong plant (of either variety)	...	...	2 guineas.

We have also a few extra-size plants for sale.

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER, and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, begs to solicit the attention of the Gentry to his prices for cash. Good substantially built Greenhouses, fixed in any part of the kingdom 42 feet long, 13 feet wide, 90*l.*; 21 feet by 13 feet, 50*l.*; 12½ feet by 10 feet, 30*l.* A large assortment of Melon and Cucumber boxes, summer houses, &c. Estimates for any branch in the above line either in iron or wood, or park fencing.

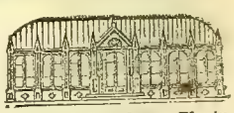
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.



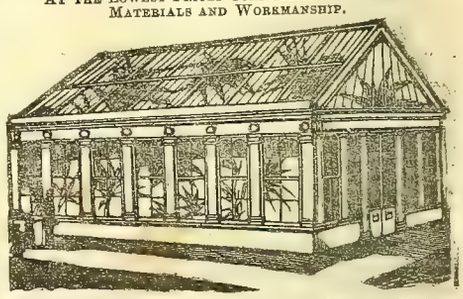
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

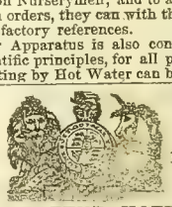


GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT



E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

THE COMFORT OF A FIXED WATER CLOSET for 1*l.*—Places in gardens converted into comfortable water closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Indispensable for the health and comfort of a family. Hermetically sealed Inodorous Chamber Commodes, 1*l.* 4*s.*, 2*l.* 6*s.*, and 3*l.*; also, Improved Portable Water Closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE and Co.'s, removed to more commodious premises, at 46, Leicester Square, London.

FIRST-RATE NEW FUCHSIAS, VERBENAS, & PETUNIAS OF 1854, AT GREATLY REDUCED PRICES.

WILLIAM RUMLEY & SONS are now sending out the under-named in fine healthy plants, hamper included, or free by post.

FUCHSIAS, the following best new varieties of 1854, 20*s.* per dozen, 6 for 12*s*, or 2*s.* 6*d.* each, viz.—Autocrat, Admiral, Clio, Duke of Wellington, Elegans, Grandissima, Globosa splendens, Mrs. Charles Palmer, Monarch, Magnifica, Omega, Queen of Hanover, Trentham, Vanguard, &c.

VERBENAS.—The following comprise the very best sent out this season, many of which are quite new in character, and very distinct; price, 20 for 15*s.*, 12 for 10*s.* 6*d.*, or 6 for 6*s.*; or, our selection, 9*s.* per dozen, or 6 for 5*s.*, viz.—Ehlouisante, Mrs. F. G. Caley, Subram, Pandora, Canary Bird, Ajax, Arethusa, Emily, Captivation, Francisse Rousseau, Arthur, Alice, Mrs. Gerard Leigh, Climax, Hector, Annie Laurie, Madame de Frileuse, Giralda, Triumph, Vicomtesse de Balleval, Arsine Baigard, Augustine, Queen of Roses, Incomparable, Sulphur Model, Heroine, Iris, Jessie, Cardinal Wiseman, Magnificent, Caliban, Peter, Dick, Madame Schmidt, Queen, Noblissima, Annette, Fair Rosamond, Comet, Madame Bindeer, National, Superb, Bridesmaid, &c.

PETUNIAS, all the best of 1854, 12*s.* per dozen, or 6 for 7*s.*

The above will be forwarded immediately on receipt of a post-office order, payable at Richmond.

Gilling, near Richmond, Yorkshire.

PHLOX DRUMMONDI RADETZKI.

JOHN CATTELL has a large stock of this very beautiful PHLOX, which is a great improvement on Mayi, having the white clearer, and the purplish crimson much deeper and brighter; every flower comes as regularly and constantly striped, and the habit of the plant is more robust; it is so very handsome that it must become a general favourite. Good Plants, 3*s.* 6*d.* each, or 36*s.* per dozen; extra fine Plants, 5*s.* each. A liberal discount to the trade. A flower may be had on application, enclosing a penny stamp.

J. C. has also to offer the following very desirable plants, well established:—

	Each.
GERANIUM, crimson ivy-leaved	2*s.* 6*d.*
GERANIUMS OF THE SCARLET HABIT.	
Trentham Rose, beautiful rose	2 6
Rosea superb, beautiful cerise rose, large truss, dwarf, strong habit	2 6
Baronne Hugel, light scarlet, white eye, very dark horse-shoe leaf, extra dwarf habit	2 6
Boule de Neige, white, large truss, horse-shoe leaf ...	2 6
Miss Emily Field, delicate pink, large truss, horse-shoe leaf	2 6
Skeltoni, white fading delicate pink, large truss ...	2 6
Kingsbury Pet, rosy salmon, large truss, horse-shoe leaf	2 6
One each of the above eight, 16*s.*	
GERANIUMS WITH VARIEGATED LEAVES.	
Golden Chain	1 6
Kinghorn's Attraction	10 6
„ Silver King ... ... 5*s.* to	7 6
Gaines' Attraction	3 6
„ Mount Hecla	3 6

Delphinium Wheeleri	1*s.* 6*d.*	Delphinium Hendersoni	5*s.* 0*d.*
„ semplex alba plena	3 6	„ magnificum ...	5 0
„ Weltoni	2 6	Petunia MontrealPurple	1 6

Anemone pavonia, brilliant scarlet, double, very hardy, flowers in March and April, Bulbs now ready to transplant, 4*s.* per dozen, or 25*s.* per 100.

A remittance or reference to accompany all orders from unknown correspondents.—Westerham, Kent.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21*s.*

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gauffred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21*s.*

The Gardeners' Chronicle.

SATURDAY, JULY 1, 1854.

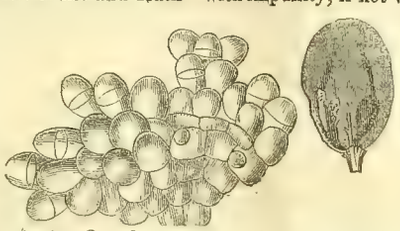
MEETINGS FOR THE ENSUING WEEK.

MONDAY,	July 3	Entomological ...	8 P.M.
WEDNESDAY,	— 5	Royal Botanic ...	2 P.M.
		Society of Arts ...	7 P.M.
SATURDAY,	— 8	Horticultural Gardens ...	2 P.M.

WITHOUT any peculiar prevalence of mildew, few years have brought more general complaints from all parts of England, of the state of the hothouse Grape crop, than the present. Sometimes the leaves are perfectly smooth, extremely delicate, and bleached; sometimes, on the contrary, they are studded with little rough warts, either with the usual green hue, or with a tendency to yellow. In some cases the whole crop of every variety is affected, while in others only one or two especial varieties have suffered. Nor is the evil confined to the leaves; for after a time the berries themselves are frequently affected, and there is great fear that the crop will, in the end, be materially injured. Ocular evidence, indeed, is now before us. Amongst other communications is one from Twickenham of diseased berries, without any especial information as to the state of the plant; but the mode of attack is so peculiar, that we have deemed the case worthy of particular notice.

The first indication of evil, as regards the berry, at least, is a black spot on or near the stalk; the berry then becomes pitted and contracted, commencing generally from the base upwards, and ultimately turns black. A section shows in every case a large cavity at the base, the corresponding ovule being mostly, but not always, abortive; the walls of the cavity are generally even, without the slightest trace of any fungal growth. Sometimes, however, the cellular tissue is forced, probably by the stimulus of the decomposing matter contained in the diseased cells and vessels, into an anomalous growth, resembling somewhat the white cellular tufts which protrude into the cavities of the carpels of Apples, as represented in this journal, 1851, page 19; and though the surrounding tissues are more or less discoloured, the sprouting cells glisten like little diamonds. Many of the more external cells are slightly elongated, and show an annular line, the first indication of further divisions.

In every case of disease which has come before us we have remarked, above all things, the complete absence of fungals, whether perfect or in the state of mycelium, and have felt convinced that the main cause of the unhealthy condition is attributable to the unfavourable weather of the past spring, combining great deficiency of light with low temperature, and at the same time with unusual dryness. It is possible that in some cases, as in those of Chlorosis more especially, the plants may have been permanently injured; but in every case it would be wise to ascertain that the condition of the roots is favourable to future prospects. It is impossible to go into any garden without perceiving the effects of the past ungenial weather in impairing the usual vivid green so characteristic of English vegetation; the condition of the Raspberries, for instance, in the district in which we write more especially, is wretched, but many other plants are scarcely less affected; and in all a generous supply of rich but not rank soil is advisable, and in very bad cases a weak solution of sulphate of iron might, if reports in its favour are to be credited, prove beneficial. It might at least be applied—as we once heard a medical practitioner say, to the consternation of the bystanders at a painful operation, in a matter almost of life and death—with impunity, if not with



advantage. Our figure represents a section of one of the diseased Grapes, and a portion of the cells from the cavities of the berries highly magnified. *M. J. B.*

THE wanton DESTRUCTION of TREES or SHRUBS, not being in a forest, is not punishable by the common law of the realm. Amongst the ordinances of the forest there was one to the effect that he who offended in cutting down wood or bushes, or in any other way destroyed the same, should be fined; but until the time of GEORGE I. there does not appear to have been any law by which a person maliciously injuring plants, without the bounds of a forest, could be punished for so doing, or by which he incurred any liability, except that of being sued for the amount of the damage done.

In the reigns of the GEORGES acts were passed making such offences punishable, and they still continue to be so under the 7th and 8th GEORGE IV., c. 30, by which, in § 19, it is enacted "that if any person shall unlawfully or maliciously cut, break, bark, root up, or otherwise destroy or damage the whole or any part of any tree, sapling, or shrub, or any underwood, respectively, growing in any park, pleasure-ground, garden, orchard, or avenue, or in any ground adjoining or belonging to any dwelling-house, every such offender (in case the amount of injury done shall exceed the sum of 1*l.*) shall be convicted of felony; and if any person shall unlawfully or maliciously cut, break, bark, root up, or otherwise destroy or damage the whole or any part of any tree, sapling, or shrub, or any underwood, respectively, growing elsewhere than in any of the situations hereinbefore mentioned, every such offender (in case the amount of the injury done shall exceed the sum of 5*l.*) shall be guilty of felony," &c.

It will be observed that it is not stated in the above enactment to what the injury must be done; it may mean that if the amount of injury done to some particular tree or trees is 1*l.* or 5*l.*, the offender will be guilty; or it may extend to persons who, maliciously injuring trees, do, in fact, whilst so engaged, cause damage to the requisite amount. Advantage has lately been taken of this ambiguity, and whilst at the quarter sessions the latter was held to be the true construction, the Court of Criminal Appeal held the first to be the correct meaning, and the offenders consequently escaped. The case, as reported in a late number of a legal journal, was as follows:—

At the last sessions for the West Riding of Yorkshire, two men were prosecuted, under this section for maliciously damaging some trees in a hedge, not growing in a park, &c.; to obtain a conviction, the prosecutor had to show that the amount of damage exceeded 5*l.* in value. A sworn valuer proved that the damage amounted to 5*l.* 14*s.*, which he made out thus—Stubbing up the old hedge, which was necessary to repair the damage, 15*s.*; post and rails to protect new hedge, 3*l.* 10*s.*; Quickwood, setting and cleaning, 9*s.* 6*d.*; injury to tree, 1*l.* The court held there was damage to the amount of 5*l.* and upwards, within the meaning of the statute, and convicted the prisoners.

It was objected on their behalf that, as 5*l.* worth of damage was not done to any tree, &c., the prisoners ought to be discharged, and the Court of Criminal Appeal, consisting of POLLOCK, C.B., PARKE, B., CRESSWELL, EARLE, and CROMPTON, J.J., thought so too; and holding that all the items of the valuations beyond the 1*l.* represented damage merely consequential, quashed the conviction. (See R. *v.* WHITEMAN, 18 Jur. 434.)

This decision is one of considerable importance; for, without making any comment on the conclusion at which the learned judges arrived in the above particular case, we are bound to suppose it to be the law that under the above section of the act of Parliament no person can be prosecuted for maliciously damaging trees, &c., unless the amount of the injury done to *them* exceeds 1*l.* if they grow in a park, &c., or 5*l.* if they grow elsewhere. An ordinary person would have thought that by "the amount of the injury done" was meant the amount required to restore the property as nearly as might be to its previous condition, and that some damages merely consequential, *e. g.*, the price paid for new Quicks, and the wages of men employed in planting them, and of course in preparing the ground for their reception, might properly be taken into account in estimating the amount of injury done.

The learned judges have, however, held otherwise, and it may save some of the readers of the *Gardeners' Chronicle* considerable expense and annoyance if the result of the above trial is borne in mind.

There is, it is true, another section in the act (§. 20) in which the amount of injury done need be only 1*s.*, and by which the penalties are, for the first offence, a fine not exceeding 5*l.*; for the 2d, hard labour for not more than 12 months and flogging; and for the 3d, felony punishable by transportation, as in § 19.

There is also another section (23) by which persons maliciously damaging fences are punishable without any restriction as to the amount of damage done; so that, notwithstanding the great favour shown to offenders by the supreme court, it is to be hoped that rascals, as cunning as they are ill-disposed, cannot maliciously injure their neighbours' plants with complete impunity.

VEGETABLE PATHOLOGY.—No. XXVI.

118. It appears probable, from Gærtner's observations, that two kinds of pollen will not act at the same time on one stigma. It is at least certain that a pistil is much more easily impregnated with its own pollen, and in hybridising it is therefore essential to remove the anthers of the flower under experiment before the bursting of their cells. A curious observation made some years since by Mr. Thwaites, shows, however, that where two embryos are formed and come to perfection in the same sac, two totally distinct varieties may be produced from the two embryos. Unfortunately, in consequence of an accident, the plants did not arrive at perfection, but the difference of the foliage and habit was unequivocal.

119. The result of hybridisation, even where at first sight apparently good, is not always beneficial. Though many fine and useful varieties are produced, there is also a peculiar delicacy of constitution and tendency to disease in many. The whole subject is indeed of the greatest importance as regards cultivation and the improvement of the varieties of useful plants, especially where prevalent maladies are concerned. The only remedy, in many cases, is the substitution of healthy varieties for those which have proved sickly, and these can only be provided, in the majority of instances, by judicious crossings of perfectly healthy parents.

120. In some instances hybrids show symptoms of disease from the first, exhibited more especially in a species of chlorosis, which resists every mode of treatment. In some attempts to procure hybrids Mr. Herbert found it absolutely impossible to obtain any result which would bear the test of cultivation beyond a few months. In these cases no flowers were produced; but it is obvious that less glaring instances may occur in which there may still be a dangerous tendency to disease; and as varieties are notoriously apt to hybridise, this tendency may be communicated to varieties at first apparently of great promise. It is obvious, therefore, that no variety should ever be used for impregnation which shows the slightest symptoms of disease, and as in the improvement of the breed of

sheep and cattle, perfect results can only be expected from the patient and judicious adoption of some such principles.

121. As soon as impregnation takes place, in most instances the external organs of the flowers, or at least the petals, wither, and the main flow of the sap is in consequence directed towards the nascent pistil. Those flowers, consequently, which have had no application of pollen, whether natural or artificial, remain expanded for a longer time, so as to multiply the chances of impregnation. When once, however, the stigmatic surface* has become disorganised to such a degree as to make impregnation impossible, whether by natural decay or by accident, the flower, together with its peduncle, withers and falls, while the unimpregnated germen very rarely continues to live and go through the normal degrees of development. It is probable that where such is apparently the case there was a perfect impregnation in the first instance, and afterwards, when the ovules had become accidentally abortive, the walls of the ovary had received a sufficient stimulus to run through their usual course. In Cucumbers, for instance, apparently perfect fruit occurs in which there is not a trace of anything more than minute ovules, none of which have increased materially in size, and the same observation applies to other fleshy fruit. Fruit, indeed, will sometimes set in both Melons and Cucumbers without the presence of male blossoms, but it must be remembered that in both, and especially in the former, imperfect stamens often accompany the stigmas. *M. J. B.*

AOTUS GRACILLIMA.

THIS slender-growing graceful-looking plant is well worthy of more attention than it generally receives, for when well grown it is very ornamental. It is readily propagated by means of cuttings of strong, short-jointed, young shoots, which root very freely if selected when about half ripe. But the propagation of such plants as this had better be left to those who have proper convenience for doing it well, for amateurs generally fail in producing good young plants; and leggy ill-propagated examples of any of the species of this genus are not worth house-room. Beginners procuring young plants from the nursery should be very careful to select healthy, strong, bushy ones. If obtained at once, place them in a cold frame, where they can be kept cool and moist, and shaded from the midday sun. If they appear to require more pot-room, examine the state of the roots, and give a moderate shift if necessary; but unless the ball is found to be well filled with healthy roots, defer shifting until this is the case; for there is considerable risk and no advantage in over-potting such plants as this. It is desirable, however, to get such things into the pots in which they are to be wintered as soon after this season as possible, so as to allow of having them well established before winter; therefore shifting should be attended to as soon as the plants require it. Keep rather close and moist for a fortnight or so, after repotting, giving water very carefully; but sprinkle the plants over-head morning and evening, and keep the atmosphere as moist as can conveniently be done to prevent rapid evaporation until the roots get hold of the fresh soil. During the growing season attend to keeping the shoots nicely pegged down or tied out, in order to admit light and air, and to secure strong growth.

After the middle of August discontinue syringing and shading, and expose the plants freely to sun and air, and, when it can be done without danger of frost or heavy rain, leave the lights off at night, and endeavour to have the wood strong and well matured previous to winter. When cold or foggy weather sets in it will be advisable to remove the plants to their winter quarters, which should be near the glass in the greenhouse, where they may receive all the light possible, and a free circulation of air whenever the weather will permit; for growth must not be encouraged at this season. Give water very sparingly to the soil, and if the house is properly managed, it will be necessary only at considerable intervals; and when any is given, the ball should be thoroughly moistened. Towards the middle of March cut the shoots back as much as may be necessary to induce the buds to break closely, and place them in the closest part of the house, keeping them well supplied with water at the roots, and a slight sprinkle with the syringe on the mornings of bright days will be useful. As soon as the buds have fairly started shift into pots two sizes larger than those in which the plants have been wintered, and place them where the night temperature may range from 40° to 45°, allowing it to rise some 10° with sunshine and air. Keep a watchful eye, however, upon the young specimens, and endeavour to secure well placed strong growth, regulating the temperature, &c., more by the state of the plants than by any preconceived notion, or arbitrary rule; and if insects are perceived they must be eradicated at once. Owing to the difficulty of maintaining in large houses a cool moist atmosphere, without which these plants can hardly be induced to make strong rapid growth, they should be removed to a cold pit or frame as early in spring as the weather proves at all settled. Afford them plenty of pot room during the growing season, as much warmth and moisture as they will bear without making weakly growth, exposing them to all but the mid-day sun, and keeping the shoots carefully tied out, and if all goes on well they form nice compact little specimens by winter, and will bloom profusely the following spring.

They should be wintered as recommended above, and of course they should be allowed to remain in the greenhouse to bloom, and the flowers should be carefully shaded from bright sunshine, as their beauty soon fades unless this is attended to. After flowering, the shoots must be cut back, the plants repotted, &c., as already recommended, taking care, however, not to over-pot, and, with careful attention, large handsome specimens will be obtained in the course of a few years. The only suitable soil for this genus is good light rich turfy peat, which should be broken up rather fine, and well intermixed with about one-fourth its bulk of clean silver sand, and a small portion of lumpy bits of charcoal. *Alpha.*

* In cases, as for example in the Pear, where the stigmatic surface has been withered by frost without the whole germen being affected, we have observed the decay creeping down the style to the ovules, and ultimately affecting the germen itself. In such instances the decay of the ovule is of course premature. In these cases, though the flower is not impregnated, the germen does not wither immediately, but a practised eye will at once distinguish such fruit as certain to fall, when its neighbours begin to attract the juices more vigorously.

ORANGE GROUNDS OF BLIDAH, IN ALGIERS.

THE cultivation of Orange trees in Blidah offers great advantages, is becoming more and more common, and will before long give rise to a commerce as advantageous to France as to Algiers.

The Orangeries at Blidah and Koliah occupy a space of about 425 acres, and consist of 23,680 Orange trees, and yield an annual income of 114,855 francs in addition to that obtained from similar fruits, such as Citrons, Lemons, Cedrats, and Bergamottes, which will also in time become of considerable importance.

As an average the net produce of each Orangery, after paying for its maintenance, tilling, watering, and for pruning, is about 800 francs per hectare. Some of the best Orangeries in Europe give an annual net income of 1200 francs per hectare, and on the other hand there are Orangeries, especially those belonging to the Arabs, which do not yield more than 500 or 600. This arises from the fact that the trees are left entirely to themselves, except that they are badly watered; an Arab never works in his Orangery, never lops or prunes his trees, and, consequently, obtains nothing but stunted worthless fruit.

It was not until 1850 that Oranges were exported into France; the towns to which they principally went were Paris, Lyons, and Marseilles. Before this time Oranges were very cheap; the Arabs were the only persons who bought them in the markets of Blidah, to carry them to the towns inland and on the coast. But in 1850 the appearance of French buyers in the markets caused an entire change. Their first operations were not fortunate; on the one hand they were clogged by the routine of old habits of commerce, and in the next place they were hampered by a heavy duty which has been since repealed. Another cause of failure was the inexperience of the agents employed, and great difficulty was found in procuring persons at Blidah sufficiently intelligent to pack the fruit well. This requires peculiar care and great dexterity, as it is necessary not only to prevent spoiling but to preserve that freshness which is so much appreciated.

In 1851 the exportation was more satisfactory; but important operations of a very different kind from those in the preceding years were being carried out towards the end of 1852, and they promised great success. At this time three houses, two at Marseilles and one at Ollioules, imported into France 3,206,000 Oranges, and at least as many were imported in smaller quantities; so that at the close of 1852 six millions and a half of Oranges had found their way into the French markets. This year workmen have been brought over from Hyères and Ollioules by some merchants upon advantageous terms, and it is expected that the fruit will arrive in better condition, and yet be cheaper than before, so that the operations will be such as to encourage further speculation in this line.

The Orange flowers have not yet been turned to any account in Blidah, and still they might be exported. Attempts have recently been made to extract orange water and essence of neroli from the Orange flowers; and these attempts, though unsuccessful when made with flowers of the sweet Orange, have succeeded when those of the bitter Orange were distilled. From the last a great quantity of essence of neroli is obtained, as is also a water which will well bear comparison with that of Grasse or Portugal.

It is clear from these facts that Oranges are becoming of great importance to Algiers, and especially to the department of Alger. The abolition of the duty has had a very favourable effect; and what is of immense consequence, the growers endeavour to improve the quality of the fruit by an intelligent cultivation, which will alone enable them to compete with success with the growers of Majorca, Valencia, and Portugal. A great deal remains to be done in this line.

It is absolutely indispensable, however, that there should be a sufficient supply of water in summer, and the arrangements at Blidah for furnishing the requisite amount are certainly deficient. The open canals should be replaced by covered stone conduits, in order to prevent loss both by evaporation and absorption by the soil. The Minister of War has lately taken steps to effect this desirable change, and has offered prizes for those whose orangeries are in the best condition, and there is every reason to hope that the Orange will be more and more cultivated in Algiers. *Revue Horticole.*

DESCRIPTIONS OF NEW PEARS CULTIVATED BY M. DE LIRON D'AIROLES, AT LA CIVELIERE, NANTES.—BY HIMSELF.

(*Continued from p.* 404.)

Beurré Bretonneau.—Tree vigorous, and abundant bearer, adapted for a standard or pyramid. Fruit as yet variable in form, but generally it is long, pyriform, contracted near the stalk end, 4 inches in length, and about 3 inches in diameter at the widest part. Skin rough, pale green, changing to golden yellow at maturity; the side next the sun is reddish brown, much dotted and freckled with distinct russet specks. Flesh fine, yellowish-white, buttery, half melting, sugary, vinous and perfumed. Keeps till May or June. Named in compliment to Dr. Bretonneau, of Tours, in 1846, by Major Espéren.

Poire de Tongres.—The tree is a very strong grower, and succeeds better on the Pear stock than on the Quince; it is naturally pyramidal. Fruit very large, obovate, 4½ inches in length and 3½ inches in diameter; stalk ¾ of an inch in length, obliquely inserted. The surface of the fruit is uneven; skin bronze coloured, changing to a deep brownish yellow when fit for use; the side next the sun is streaked with red. Flesh fine, white, melting, juicy, sugary, vinous, and agreeably perfumed. Season, middle of October. Raised by M. Durandeau, at the village of Tongres.

Josephine de Malines.—Tree vigorous, and a good bearer, forming a handsome pyramid, and may be worked either on the Pear or on the Quince stock, and it may be planted against an east or west aspect. The fruit is small from a standard, middle-sized from a wall, obovate. Flesh fine, buttery, juicy, sugary, and perfumed. Season, January to March. Raised by Major Espéren, of Mechlin.

La Juive.—The tree is handsome and vigorous, suitable for forming a pyramid. Fruit middle-sized, turbinate; stalk nearly an inch in length, inserted in a cavity. Skin smooth, yellowish-green, marbled with green and brown, red next the sun. Flesh very fine, melting, sugary, and highly perfumed. Season, November. Bore for the first time in 1843. This first-rate Pear was obtained by Major Espéren.

Jules Bivort.—Tree of moderate vigour, but very productive. Fruit large, obovate, about 3½ inches in height, and 3 inches in diameter. Skin dull green, becoming yellow when fit for use, dotted with brown, and slightly tinged with red next the sun. Flesh yellowish-white, fine, melting, half buttery, with abundance of sugary, vinous, much perfumed juice. Fit for use about the middle of November. Raised by Alexandre Bivort, and bore for the first time in 1847.

Poire Andouille.—Tree vigorous, and a great and constant bearer, suitable for a standard or a pyramid. Fruit 3½ to 4 inches in length, and about 2 inches in diameter at the widest part, near the eye; and it is nearly as thick towards the stalk, which is short, thick, and obliquely inserted. Skin yellow, flesh white, coarse, juicy, sweet, and agreeably perfumed. This Pear somewhat resembles the Beurré Bosc, but it is smaller, and so deformed that it has received from us the name of *Poire Andouille*, that being the form which it generally assumes. Were it not rather gritty it would be an excellent dessert fruit; but it would furnish a good supply throughout the season by being dried in the oven. We have tasted the fruit fresh from the tree in the middle of September, its usual period of maturity, and at the same time fruits of the previous year, dried in the oven, and still very excellent. We received this excellent variety from the Abbé Canet, commune de Montigné, near Montfaucon (Maine-et-Loire), who had cultivated it for 15 years. He obtained it from the nurseries of M. Langlois, at La Brulais, near Beaupreau, which were soon given up. M. Canet had no name for the fruit, nor had he seen the variety in his neighbourhood. [From the above description, it is very probable that the variety in question is the common Calebasse, not the Calebasse Bosc or Beurré Bosc, to which, however, it has externally a resemblance. The common Calebasse is an extraordinary bearer, and on this account it is grown in some places near London; but if it should prove the same as the Andouille, it appears that it would be valuable for drying.]

Home Correspondence.

Aëration.—In reply to "R. T.," I would say that, as the openings of the air channels are at right angles to the course of the wind, there can be no more tendency to blow down one channel than down the other—no more than there is in a chimney-stack;—the mere passage of the wind over their mouths, supposing those mouths to be at the same level, does not alter the amount of their out-pouring, though it certainly does the direction of it. But, besides the theoretical statement, I know from practical experience, having put it to that proof, that with equal areas of inlet and outlet there is no blowing down either channel: nay, more, the tendency to blow downwards does not amount to anything like danger to the tenderest plant, when the cross measurement of two outlets to one inlet is as much as 29 inches outlet to 11 inlet, though this arrangement is directly opposed to the correct one, which is that the areas of both openings should be exactly equal. The great advantage of the plan is its entire independence of all lateral draughts, and, to be fully carried out, there should be no other openings whatever; for, if any opening of greater or equal area than the ventilator be at a lower level, the effect is to convert both the ventilator channels into outlets, and is so far only the common arrangement of

opening the lower sashes, and brings with it all the usual evils. The interchange of air within a plant-house ventilated on my plan is effected entirely by the difference of temperature of the columns of air, so long as one is warmer, and consequently lighter in weight, than the other: the actual weight or pressure is immaterial —the difference between the columns is the measure to be attended to. Suppose the cool air column to be of such a size as to weigh 480 grains, an equal-sized column of air, 20 degrees warmer, will only weigh 460 grains, showing a difference of 20 grains, and this 20 grains is still the difference, whether 1 or 100 times 480 grains be the superincumbent weight or not. "R. T.'s" comparison of a feather to 10 lbs. weight is rather extravagant; but, making use of his own simile, a 10 lb. weight plus a feather, must weigh more than 10 lbs. alone, and it is this excess that is the moving power. "R. T." seems not to remember the very small amount of power, measured in grains, by which a hot water apparatus is made to circulate; but water is nearly 900 times the weight of air; and if the heavier can be moved by a few grains excess of weight, surely the lighter can. *J. P. S., Chesterfield.*—The mode of ventilation for plant houses recommended by "J. P. S." is correct enough in principle, but not sufficiently explicit as a guide to others, and may even mislead. If, for instance, the lower mouth of the box carrying off the air descend any depth within the house, all the air in the house above that level will remain stagnant and unrenewed, if it descend 3 feet; in that 3 feet of the upper part of the house the air is stagnant and unrenewed, however active the ventilating box may be. To make this mode of ventilation as perfect as possible, the lower mouth of the exit tube ought not to descend into the house at all, but the tube or box be carried as a chimney above the house; and the entrance box or tube ought to open at or near the floor level. I do not, however, consider this mode of ventilation so good as others in operation in various places. I will mention what I consider to be the best. This is to admit fresh air to the floor of the house by an underground drain or conduit brought from some distance, and to let off the used up or impure air from the highest part of the house by chimneys or ventilators carefully deprived of any back draught. The object of the underground drain is to admit air of a medium temperature, either by night or day, summer or winter. Of course it ought to be of sufficient size to afford an adequate supply, and if for winter or early spring cultivation, of sufficient length and depth to bring the moving column of air to the temperature of the passage it traverses; in fact, I am of opinion, if this conduit were carried along through the stratum of invariable temperature sufficiently far, air should always enter the house at the mean temperature of the latitude of the place where the house is; and thus might we cultivate the most of greenhouse plants without artificial heat. Arnot ventilators, with flaps to prevent back draught, or chimneys with the smoke-cure of an "old wife" on each, to effect the same purpose, are the best exits for the used-up air. The inlets for air ought not, of course, to be placed directly under the outlets, but diagonally, so as to keep the whole air of the house in constant motion. *John Lyell, M.D., Newburgh, Fife.*

Accelerated Vegetation.—Can you furnish your readers with any account, coupled with explanation, of the experiments said to be exhibited at Bromley, in which flower buds are brought forward almost instantaneously into blossom, the buds not being so advanced as to render the operation generally intelligible. And, herewith, can you give us the theory or solution of those famous exhibitions of the Indian jugglers, who sow a seed, raise it up into a plant, and bring the plant into blossom, under the eyes of the spectators. Is this effected by legerdemain, or is it a real operation of Nature accelerated by some art? *A. H.* [We are too ignorant of the art of legerdemain to assist our correspondent.]

How to Destroy a noble Tree, as practised in all our Public Parks.—Take any tree (particularly a slow-growing, valuable one), measure no more than 20 feet from its bole, and then plant a Horse Chestnut or other quick-growing tree in every direction around; in a very few years the ends of all the branches will begin to decay, and in a comparatively short time you will see the last of your fine old tree, especially if, after a severe winter, you carefully abstain from cutting out any dead wood whatever. That I am only stating facts, any one who will go into the Kensington Gardens or Hyde Park may satisfy himself. *A Constant Subscriber.*

Materials for a Cutting Pot.—Provide either broken potsherds, pebbles, or chips of stones from a mason's yard, and place them in the bottom of the pot. Over these put rough fibrous peat or turf; this will act as drainage, which is most essential; then prepare peat, loam, and silver sand in equal parts, with the addition of a little powdered charcoal; let these be well incorporated together and passed through a fine sieve; put this compost on the top of the above-mentioned drainage and press it well down. This must be in sufficient quantity to reach within 1½ inch of the top of the pot. Finish with pure silver sand, and let the whole be well watered, to settle all down before the cuttings are put in. Then having bell-glasses at hand, and the pots ready, dibble the cuttings into the sand, which will induce the emission of roots, and these will strike down into the compost, which, prepared as directed, will suit any plant. After the cuttings are inserted let them be watered with a fine rosed pot, to settle the sand round them. Cover with the bell-glasses and shade until they have become rooted. Cuttings must not be put in too closely together, otherwise they will damp off. Wipe the condensed moisture from the glasses once a day, but keep them close for the first fortnight or three weeks, afterwards admit air by degrees, by placing a little wedge under the glasses. When the cuttings are rooted remove the latter altogether. Sprinkle occasionally with water from a fine rosed watering-pot; by attending to these minutiæ success will certainly be attained. A slight hotbed is the best place for cuttings. *A Gardener, June* 26.

Vine Mildew.—I have tried sulphate of iron as a preventive of this disease, but certainly without any marked advantage; whether I applied the saline mixture to the roots in a too concentrated form, or not strong enough, I am unable to say, 1 oz. of the salt to 2½ gallons of water being the proportion used, but it did not prevent my crop from being destroyed by the mildew, and at the time I imagined that the Vines did not look quite so well afterwards; unquestionably, however, sulphur in almost any form is likely to prove, more or less, beneficial; but what I much doubt is, that it is absorbed and taken into the circulation of the Vine through the roots in sufficient quantity (if at all), to produce any sensible effect. Upon the whole, from some experiments I have made, I am decidedly of opinion that the direct outward application of a remedy can only be safely depended upon, as Grape mildew is clearly not the result of disease inherent in the Vine itself, the mischief being simply caused by the vegetation of a parasitical fungus resulting in the disorganisation of the vegetable fibre of the more succulent parts of the plant by the unnatural abstraction of its juices; in fact, Vine mildew may strictly be called a skin disease which, happily like another to which the cuticle of the human body is liable, can readily be destroyed by the timely exhibition of the same specific, which seems to enter very largely into M'Adam's composition, and which, by the way, I have now seen used in many houses without a single failure; and I believe that it will soon become the standard remedy, as it fully deserves to be. But I would again say to Grape growers, don't neglect mildew for a single day, for it soon gets so firmly rooted, and forms such a thick coating to the fruit in its advanced stage of vegetation, that it will then (as M'Adam judiciously and very truly remarks in his directions) probably require frequent syringing, when in its earliest stage one would have been sufficient to destroy it, putting out of the question the irreparable injury done to the fruit. I beg to hand you a few berries of Black Prince and Muscat from a neighbouring Vinery which was attacked by the blight, and which has at present had only one syringing with M'Adam's stronger liquid, about two or three weeks ago, the effects of which, as usual, are most decided; as you will observe, and I question if the mildew vegetates again this season after a second application of the wash. *Vigneron, Torquay.*

Rabbits.—I have a geometrical garden surrounded by a wire net 3 feet high. Observing my Verbenas cut down, I suspected that rabbits got in, and getting up at 4 o'clock this morning, I found one within the forbidden precincts. I pinned him in a corner, and just as I raised my stick to strike he paused a moment, and then made a bolt at a mesh fully 5 inches from the ground, and though he hung in it a moment, he got through before I could secure him. He was fully half grown, and quite as capable of mischief as a large rabbit. I thought it impossible for even a very small rabbit to get through the netting. The meshes are hexagonal, 3 inches long by 2 high. I write this for the two-fold purpose of informing your readers of the uselessness of the 3-inch mesh, so frequently advertised as a rabbit net, and of inquiring of your correspondents, some of whom have met, no doubt, a similar case, what they did to remedy the evil. Were I ordering a new net, it should be 3 feet high, and the lower part, for 14 inches, should be 1½-inch mesh. *Cavanensis.*

Rain Gauges.—I was somewhat surprised at the statements that appeared lately of Mr. Lawes' comparative observations of the fall of rain as indicated by large and small gauges. I think Mr. Thompson's explanation is insufficient; for condensation will be in proportion to the surface of metal of which the gauge is composed, and a small gauge has probably a larger surface in proportion to its receiving area than a larger one; but with a 10-inch gauge I doubt whether I have ever registered a greater amount of water due to condensation of vapour than 0.005 inch. However, Mr. Lawes' last communication has enabled me to offer another, and, I think, a satisfactory explanation: he admits, that if the water collected in the small gauge had been accurately weighed, a result might have been obtained similar to that supplied by the large gauge. I must, therefore, beg you to pause before you draw such sweeping conclusions against the accuracy of the observations made hitherto by meteorologists with gauges of the ordinary size. The fact is, Mr. Lawes has been misled by the practice to which his object (not primarily meteorology) has drawn him. He weighs the water caught in his gauges. Now parts of an ounce are quite sufficient to give a result of extreme accuracy with such a large receiving surface as 1-1000th of an acre. If we take his last published table, and reduce the largest quantity there registered, in proportion to the receiving surface of his smaller gauge, the result in weight is but a small fraction of an ounce; but such a quantity, or even a 20th part of it, is capable of yielding an appreciable result by measure. I confess myself quite unable to explain the observations made at Pembroke Dockyard; but they seem to me to betray such internal evidence of error, irrespective of the relative size of the gauges, as not to disturb my conviction of the efficiency of rain gauges of an ordinary size, if due attention be paid to their position. There is an objection among observers to use gauges under 100 inches of receiving surface, partly from the possible effect of the wind; but more, because with a less amount of water than 100 inches will collect, it would be difficult to ensure accuracy in measuring. As far as my own experience goes, it is decidedly in opposition to Mr. Lawes' conclusions. I once tried as a receiver a glass funnel 3 inches in diameter, the receiving surface of which would consequently be only about 7 square inches, and the results were exactly the same as those with a surface of 100 square inches; the experiment was made in a season which abounded in soft copious showers, which was favourable to its action; in stormy weather the result would, I dare say, have been different; but, *valeat quantum*, it is evidence on my side of the question, and I do not think meteorologists will willingly look on the results they have obtained as nugatory without much stronger evidence than has been already adduced upon the other side. *John Slatter, Rose Hill, Oxford, June* 20.

Kennington Park.—I can entirely corroborate the statement of your correspondent "M. L. R." as to the disgraceful state of the new plantations. I was unluckily not in the House when Mr. Spooner asked his question. Had I been there I would have endeavoured to elicit some further information from Sir W. Molesworth. With reference to his statement "that the outlay will not occur again," that entirely depends upon the arrangement made by Government as to replacing the dead Hollies, &c. &c. Knowing, as I do, how these matters are generally managed by public departments, I shall be very agreeably surprised if John Bull is not called upon to pay the bill. *M. P.*

Weigela rosea.—People complain that this does not flower so freely as they could wish it, and this state of matters will doubtless continue until the conditions necessary for its perfect development have become better understood and practised. Experience has proved that Chinese shrubs in general, and this one in particular, require to be potted or planted on a well drained bottom, in a warm aspect, and in a sheltered situation. This can best be effected by planting on little mound-like elevations, composed of lime-rubbish, brick-bats, or potsherds; these will keep the main roots near the surface, and facilitate the production of fibres. Treated in this way the plants will become thoroughly acclimatised, and both the wood and roots will grow and ripen together. This is a way by which a seasonable profusion of flowers may be obtained, and the only one that can be depended upon with certainty. To have vigorous growth only it is merely necessary to plant either the Weigela rosea or the Forsythia viridissima in a deep strong soil, where the plants (minus the flowers) will thrive luxuriantly. But if the object is to induce the production of well-ripened short-jointed flowering wood, it is indispensable to success to commence its culture by furnishing the plants with efficient drainage, such as I have described. *R. Miles.*

Societies.

Horticultural, *June* 27.—The Rev. W. L. B. Hawkins in the chair. Lady Harriet Clive, Mrs. Assheton Smith, and S. B. Sharp, Esq., were elected Fellows. The subjects for which special prizes were offered on this occasion were collections of vegetables, of which two of English and one of foreign growth were produced. Of the former two, that to which the first prize was awarded was furnished by Mr. Smith, gr. to Mrs. Reay, of Little Blake Hall, Essex. It contained 47 varieties of kitchen garden produce, while that to which the second medal was assigned, and which came from Mr. Leslie, gr. to Mrs. Alexander, of Ramsgate, only contained 36. Both collections were, however, of very considerable merit; and as an example of what an ordinary kitchen garden can now furnish for table, after so unfavourable a winter and spring as those just passed over, it may be worthy of mention that Mr. Smith sent Early Emperor, Early Warwick, and Ringwood Marrow Peas; Fulmer's Early Kidney Bean, Asiatic and Walcheren Cauliflowers, large, white, and good; West Ham and Vanack Cabbages; Early Horn Carrot, Red Beet, Paris Cos Lettuce, Jewess Cucumber; Deptford, Strasburg and Reading Onions; Chives, Horse-radish, Linnæus, Rhubarb, large and coarse, and Mitchell's Prince Albert, ditto, very good Spinach, Early Dutch and Red stone Turnips, Jackson's Kidney and Fortyfold Potatoes from an open border, and Lapstone Kidney from a frame; Curled Parsley, common, Golden, Normandy and American Cress, and White Mustard, red and white Orach, Wood's Early Frame, and red and white Turnip-rooted Radish, Balm, Burnet, Fennel, Horehound, Sweet and pot Marjoram, Winter Savory, green and red Sage, common and Lemon Thyme, and Garden Sorrel. Of vegetables of foreign growth, Mr. Lewis Solomon, of Covent Garden, sent large and very highly coloured Tomatoes, such as our comparatively sunless climate and low out-door temperature can never be expected to produce; a bundle of Asparagus weighing 9 lbs. 4 oz., Globe Artichokes, beautiful large white Cauliflowers, a bunch of Carrots, a punnet of good looking Moor-park Apricots, and another of Comte de Paris Strawberry, a favourite sort with the French, but, except in roasting seasons, rather too acid when grown in England. These received, as they well

deserved, a Silver Knightian Medal. Mr. Jones, gr. to Lady Charlotte Guest, had three well grown and finely ripened Queen Pine-apples, weighing, one, 4 lbs. 14 oz., and the other two, each 4 lbs. 12 oz. The same exhibitor had also two Green-fleshed Melons, which weighed 4 lbs. 2 oz., and 2 lbs. 3 oz. A Banksian Medal was awarded for the Pine-apples. Seven beautiful Bellegarde Peaches and a dozen Violette Hative Nectarines, came from Mr. Chapman, gr. to J. B. Glegg, Esq., of Withington Hall, Cheshire, to whom a Banksian Medal was very justly awarded; and a Certificate of Merit was assigned to Sir James South's gardener (Pyle), for four brace of very large and fine Cucumbers, just in perfection, the decaying blossoms still adhering to their points. Six were white spined, the name of the other two was unknown. From the garden of J. Harrison, Esq., Snelstone, Derbyshire, came a Verdelbo Vine, with 20 bunches, grown in a pot, upon the spur system. It was in every respect an excellent example of this description of Grape culture, the foliage being clean and healthy, and the bunches, though small (which they naturally are), extremely good. A Certificate of Merit was awarded to it. The same gentleman also contributed a specimen of ½-inch meshed white woollen netting, for protecting wall-fruit trees from spring frosts, and which was stated to answer the purpose perfectly. The piece exhibited was nearly two yards wide or rather deep, with about a foot in breadth of calico at top and bottom—the top being furnished with loops for attaching it to a rod or hooks immediately under the coping, and the bottom being provided with strings for tying it to a horizontal rail about 2 feet from the ground and 3 feet from the base of the wall, thus leaving room for walking comfortably along inside. This kind of protection, admitting, as it does, light and air freely, is kept constantly on while it is wanted; and if properly dried, folded up, and taken care of when not in use, it is reported to last good for many years. As to cost, where everything connected with it had to be bought, it was stated that a piece of wall might be covered with it for about 2s. a yard run. A model of Dr. Lisle's protecting contrivance, mentioned at p. 389, was also exhibited. A Banksian Medal was awarded to Messrs. Veitch, for a plant of their Eugenia Ugni, a fragrant, evergreen, Myrtle-like shrub, bearing little, cupped, pale pink flowers. It is a Chilian plant, and, in addition to its ornamental appearance, the most remarkable fact connected with it is that it produces edible fruit of the greatest excellence, and that in the temperature of an ordinary greenhouse. The fruit is stated to be about the size of large black Currants, to which it bears considerable resemblance, except that it is not in clusters, and its flavour is reported to be different from that of any fruit we yet possess, being described as being a combination of Pine-apple, Strawberry, and Guava. It must therefore be regarded as a great acquisition, the sole possession of which, we believe, belongs to Messrs. Veitch. Mr. Keele, gr. to J. Butler, Esq., of Woolwich, contributed a new Brassavola, for which a Certificate of Merit was awarded. It was a Chive-leaved kind, with singularly ribbed white flowers. The Hon. W. Fox Strangways furnished cut flowers of the Chinese Rose-scented Pæony, a bright purple variety, with as fine a fragrance as a Cabbage Rose, and certainly not half so much grown as it deserves to be; also another kind of Chinese Pæony, paler and with no scent; and pieces of the yellow Mesembryanthemum edule, which makes a handsome rock plant.—From the garden of the Society came Scheeria mexicana (Gloxinia Antirrhini), a plant with good-looking, large, pale violet, Foxglove-like flowers, with white throat both inside and out; Glossocomia clematidea, a very pale blue, bell-flowered plant, obtained from the Russians; it has little beauty to recommend it, except perhaps in the base of its little drooping bells, where there is a singular and rather handsome combination of colours. The deep blue or rather purple Myosotis azorica also came from the garden, as did likewise two more handsome hybrid Epiphyllums, the result of crossing the white E. crenatum with Cereus speciosissimus; the sweet-smelling Long-petalled Epidendrum; the buff Diplacus grandiflorus, Campylobotrys discolor (a plant of no beauty), and other plants, together with the following kinds of Vegetables:—Laitue Romaine Verte Maraichère, L. Chou de Naples, and Cock's Hardy White Cos Lettuce; Newington Wonder Kidney Bean; five kinds of Peas, among which was a very dwarf early sort, called Pois nain Hâtif à Chassis Superfine, which does not grow more than a foot high, and is a great bearer; it is, therefore, well suited for Orchard-houses and other situations under glass, in which early Peas are grown. While speaking of early Peas, it was mentioned that it was not necessary to wait till they were in fruit to have a purée possessing all the flavour of green Peas; for that might be obtained at any time, merely by cutting over the young plants when about 6 inches or so in height, and sending them into the kitchen. When cooked, these young stems and leaves were stated to communicate the flavour of green Peas. Three varieties of Turnip were also shown from the garden, the best of which was the Orange Jelly, described in another column, and a fruit of Tiley's Golden Ball Melon, the seeds of which were sown on the 1st of March last. It is round, with a pale cream-coloured skin, having patches of golden yellow on it.

Linnean, *June* 20.—Prof. Bell, President, in the chair. The President exhibited two specimens of the megalopoid form of the genus Planes, and made some observations on them. The following communications were read:—1. Extract from a letter dated Santarem, March 27th, 1854, addressed to S. Stevens, Esq., by Mr. Bates, "On the Habits, &c., of Termites."—2. "On the construction of the nest of a species of mason wasp observed in the neighbourhood of Bombay," in a letter addressed to the secretary, by Dr. G. Buist.—3. "On some remarkable Exostoses developed on the roots of various species of Coniferæ," by J. D. Hooker, M.D., F.R.S. Dr. Hooker had first observed these curious developments on the roots of specimens of Podocarpus dacrydioides, sent from New Zealand by the Rev. W. Colenso, and subsequently found them on so many other Coniferous plants, that he could but regard them as being of very general occurrence in the order. They were met with on Araucariæ of several species, Podocarpi, Taxodium, Dacrydium, Thuja, Cupressus, Phyllocladus, and Cunninghamia. Podocarpus dacrydioides was selected as an example for illustration. The roots and rootlets of this plant are studded at intervals with spherical organs, of various diameters, between 1-40th and 1-60th of an inch; they are either attached by short pedicels, or sessile, or sunk into the bark of the root, easily detached, leaving a small scar on their own surface and on the root; they are spongy in consistence, smooth on the surface, and of a pale reddish colour. A vertical section shows them to be composed of a delicate cuticle, and a mass of spongy cellular tissue aggregated around a central vascular axis, which reaches from the wood of the root to the centre of the sphere. The cells of this soft tissue are uniformly crossed on every facette by delicate transverse lines, which appear to be the result of matter deposited on the inner surface of the cell-wall, and to have the same origin as is usually assigned to spiral and other deposits in cellular tissue. The cells are invariably full of fluid, but empty of chlorophyll. The vascular axis is generally straight, cylindrical, and blunt; it is composed of woody tissue marked with the disks usual in the same tissue of other parts of the plant, and is surrounded by a delicate sheath of bast-cells. Morphologically, Dr. Hooker considers these organs as transformed root-fibrils; but the special function for which they are adapted is not apparent, though they may be supposed subservient to the office of selection of nutriment. The Podocarpus dacrydioides grows in swamps in New Zealand, but the exostoses were as abundantly produced on the roots of specimens planted in dryish earth at Kew. Some attention had been directed to the exostoses of roots by the elder De Candolle, but their general occurrence seemed to have escaped the notice of succeeding writers on general physiology. The Rev. Mr. Berkeley had described, in the *Gardeners' Chronicle*, the exostoses on the roots of the Pea, and Dr. Hooker had long been familiar with others, and especially a remarkable modification of them on the Laburnum, first pointed out to him by Prof. Henslow, who had also shown him abundance of them on the garden Bean, and on both wild and cultivated species of Lathyrus and other Leguminosæ. Except, however, on the Taxodium distichum, where they exist in a very peculiar condition, the fact of their prevalence in Conifers appeared not to have been noticed. Dr. Hooker pointed out, in conclusion, a remarkable morphological analogy between exostoses and the tubers of the root-parasite Balanophora. The structures alluded to were represented in a drawing which accompanied Dr. Hooker's paper.—4. The commencement of a memoir "on the general characters, affinities, and organography of the Clusiaceæ, particularly with reference to the structure of the embryo," by John Miers, Esq., F.R.S. The object of this portion of the paper was chiefly to call attention to the structure of the embryo in the Clusiaceæ (Guttiferæ *Juss.*), the nature of which, the author remarked, had been hitherto quite misunderstood, arising partly, no doubt, from the difficulties met with in the examination of them. The author commences by stating at considerable length the different views which have been expressed by various botanists as to the structure of the seed in this order; and then gives a minute analysis of the fruit of a species closely allied to the Clusia cruiva, *Cambessèdes*—the views of Cambessèdes, which had been almost universally adopted, but from which Mr. Miers' conclusions were widely different, having been principally derived from an examination of that species. The paper was accompanied by some admirable drawings of the seeds of several Clusiaceæ.

Entomological, *June* 5.—W. W. Saunders, Esq., F.L.S., V.P., in the chair. A fine collection of insects from Burmah was presented by Mrs. Hamilton, containing a number of rare and interesting insects of all orders (including a new Goliath beetle), whereupon a special vote of thanks was passed in acknowledgment for this and several previous donations of a similar kind from the same lady. Mr. S. Stevens exhibited a moth belonging to the genus Leucania attached to a blade of Grass, and enveloped by a fungus which had grown from its body, also a dipterous insect which had been impaled on the sharp point of a reed by the wind. He also stated that he had succeeded in obtaining a brood of larvæ from the eggs of the female of the rare Notodonta carmelita exhibited at the last meeting. The young caterpillars fed upon the Birch, and he had observed they had considerable difficulty in moulting. He also exhibited a specimen of Notodonta cucullina, reared from the caterpillar taken at Halton, Bucks. Mr. F. Smith exhibited several rare species of bees, captured in Scotland by Mr. Foxcroft; and Mr. Jansen, a number of rare beetles from the same locality. Mr. Westwood mentioned that Mr. Elmslie proposed to make an entomological excursion in the north of Scotland, and requested subscribers for his collections. Mr. Douglas exhibited specimens of Elachista Cerusella, and Mr. Boyd specimens of Elachista Treitschkiella, the larvæ of which mine in the leaves of Cornus sanguinea in their earliest state, subsequently forming flat moveable cases of portions of the leaves, within which they remain as larvæ through the winter. Mr. Westwood read a paper containing descriptions of some new Goliath beetles. He also exhibited cocoons of a species of silk moth, received from Malta from Dr. Templeton, which had recently been imported in considerable quantities from India, and thrived well in the south of Europe, the silk of which was very durable, but it was unwound from the cocoon with great difficulty—a more effectual mode of unreeling it was therefore very desirable. Mr. Saunders stated that a gentleman residing near Geneva had recently requested from him samples of the different kinds of Indian silk, as he had succeeded in unwinding all the kinds of silk of which he had been able to procure cocoons; his discovery would therefore be of great benefit when applied to the species from Malta.

Notices of Books.

Harvey's Seaside Book (Van Voorst), of which we formerly expressed a very favourable opinion, has already, as it well deserved, reached a third edition, which contains a chapter on fish and fish diet by Mr. Yarrell. The present issue is beautifully got up.

Mr. Gosse is indefatigable. We have now before us his *Aquarium* (Van Voorst), a charming duodecimo volume, well illustrated with plates in chromolithography, and good woodcuts. It is superfluous to say that the author's whole heart is in his subject, and that in acquaintance with marine animals he is excelled by no one. When we add to these qualifications an agreeable, gossiping style, enough has been said to show why he is so popular. The resident at the seaside can know no tedium, with a work like this on the table, a good coast at his feet, and a glass vessel of sea water in which the curious animals that Mr. Gosse loves to describe can be kept alive for a few days. Although crabs are not the most inviting of pets, yet the following account of the Fiddler will doubtless amuse some of our readers.

"Beneath a large flat stone, exposed at extreme low water, at the extremity of one of the low rough ledges that run out from the foot of Byng Cliff, I found in September a full grown specimen of the Velvet Fiddling Crab (*Portunus puber*). All the Crabs of this family, which contains a great number of species and not a few genera, are distinguished at once by a peculiar modification of the hindmost pair of feet, for the performance of an important function. They are all Swimming Crabs, and the facility with which they can roam through the element they inhabit, depends largely on the completeness of the modification which I refer to. Our common Eatable Crab, the bulky, thick-clawed, livid 8 pounder, that lies with all his ten pairs of feet so meekly folded across his breast, can swim—about as well as a stone of the same size. Now examine his hindmost feet, their single toe tapers to a sharp point in no wise differing from those of the four pairs that precede them. But the *Portunidæ*, or Swimming Crabs, have this last pair of feet much flattened out side-ways, and the toe in particular dilated into an oval thin-edged plate, which striking obliquely upon the water acts as an oar, with that peculiar action which is known to boatmen as sculling. In the common Shore-crab (*Carcinus mœnas*), that abundant olive-green kind which on every rocky shore little boys and girls catch, by letting down into the crevices a piece of string with a fragment of offal tied to it—we observe a transition condition of the hind-foot; there is a decided tendency to an ovate form, though the tip is yet taper and acute. And the habits of the animal agree with this structure. The power of shooting slantwise through the water exists, which bears the same sort of relation to the free and easy swimming of the typical *Portunidæ*, the Oceanic Crabs of the tropics, as the long leaps of the Flying Squirrels and the Petauri bear to the sustained flight of a bird.

"An old male of the Velvet Fiddler is a striking and handsome crab. His body generally is clothed with a short velvety pile of a pale brown or drab hue, from beneath which here and there shines out the glossy deep black shell, especially where rubbed, as at the edges. The feet, particularly the plates of the oars, are conspicuously striped with black; the large and formidable claws are marked with bright scarlet and azure, as are also the foot-jaws and face; while the eyes are of the richest vermilion, projecting from hollow black sockets.

"I said that he is a 'striking' Crab; and, though I was quite innocent of a pun when I wrote the word, it is characteristic in more senses than one. Both it and its frequent companion, the Shore Crab, when apprehensive of assault, use the powerful claws, not to seize but to strike transversely, as a mower uses his scythe; and this action they perform viciously, and with great force and effect.

"In the Aquarium the Velvet Fiddler was shy and recluse. He at once slid into the most obscure recess he could find, beneath the dark shadow of two pieces of rock that formed an arch. For some days he remained gloomy in his new castle; but at length he ventured out under the cover of night, and would wander

about the floor of the tank. But he never lost his cautious suspicion, and the approach of the candle was usually the signal for a rush back to his dark retreat. He was a fit representative of one of those giants that nursery tradition tells of, as infesting Cambria and Cornwall, 'in good king Arthur's days.' Gloomy and grim, strong, ferocious, crafty and cruel, he would squat in his obscure lair, watching for the unsuspecting tenants of the tank to stray near, or would now and again rush out and seize them with fatal force and precision. As the Giants Grim of old spared not ordinary sized men for any sympathy of race, so our giant Crab had no respect for lesser Crabs, except a taste for their flesh. I had two or three full grown Soldier Crabs (*Pagurus bernhardus*); themselves warriors of no mean prowess; two, at least, of these fell a prey to the fierce Fiddler. His manner of proceeding was regular and methodical. Grasping the unthinking Soldier by the thorax, and crushing it so as to paralyse the creature, he dragged the body out of the protecting shell. The soft plump abdomen was the *bonne bouche;* this was torn off and eaten with gusto, while the rest of the animal was wrenched limb from limb with savage wantonness, and the fragments scattered in front of his cave.

"The crabs are the scavengers of the sea; like the wolves and hyænas of the land, they devour indiscriminately dead and living prey. The bodies of all sorts of dead creatures are removed by the obscene appetite of these greedy Crustacea; and there is no doubt that many an enormous Crab, whose sapidity elicits praise at the epicure's table, has rioted on the decaying body of some unfortunate mariner. But what of that? Let us imitate the philosopy of the negro mentioned by Captain Crow. On the Guinea Coast people are buried beneath their own huts, and the Land-crabs are seen crawling in and out of holes in the floor with revolting familiarity: notwithstanding which they are caught and eaten with avidity. A negro with whom the worthy Captain remonstrated on the subject, seemed to think this but a reasonable and just retaliation, a sort of payment in kind, replying with a grin and chuckle of triumph:—'Crab eat black man; black man eat *he!*'"

The Microscope, its History, Construction, and Applications. By Jabez Hogg, M.R.C.S. 8vo. Orr and Co.; pp. 440.

It is a singular complaint for the author of a book like this to make, that "one of the most useful and fascinating of studies—the study that belongs to the domain of microscopic observation—should be, if not wholly neglected, at least but coldly and indifferently appreciated by the great mass of the general public." We should have formed an exactly opposite opinion, and have been disposed to congratulate science upon the daily increasing numbers of persons who are now occupying themselves with an instrument so costly as a microscope, and demanding so much leisure for its use. It is, indeed, marvellous to observe how many men immersed in the vortex of the busiest of all lives, that of an Englishman, nevertheless manage to spare a few hours very often for the instruction which the microscope conveys. The increasing number of books upon microscopical subjects is in itself a pretty convincing proof of the rapid increase of this kind of taste.

Mr. Hogg has compiled with very little skill a thick 8vo volume, and has illustrated it with a great number of cuts—he says 500—of which we can only say, that while some are good, others are not such as will prove either attractive or instructive. They are very unequal; and some are far too coarse to convey to the uneducated eye such a representation of objects seen through the microscope as will render them certainly recognisable. In this respect, the beautiful plates of Tulasne, Thuret, and others might have been consulted with advantage. We also regret to see the pages blemished by such careless reading as renders the work a mere stumbling-block to the young. A fungi, Torulæ diabetica, Cer[e]visiæ, Puccinias, prote[i]nic, are strange misprints in two or three consecutive pages, to say nothing of more serious mistakes as to the names of the objects represented. We should be curious to know where Mr. Hogg learned that the cut represented at p. 394 belongs to Oidium, or the Vine Mildew. Upon the whole, therefore, we can only say that, although the volume contains useful matter, it requires to be consulted with caution, and exhibits far more industry than knowledge.

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—The glass houses here are now well furnished with flowering plants, and are altogether extremely interesting and gay. The shelves of the great conservatory are one mass of bloom, the most conspicuous being that produced by the common Calceolaria rugosa, than which a more striking object at this season could scarcely be found, provided the plants are large enough to make a show. Those here are about 3 feet high and as much through, and quite loaded with yellow blossoms of the most brilliant description. It is surprising that this really handsome though old-fashioned variety is not more grown for decorative purposes than it is—for what could be more effective or useful?—and it is about as easily managed as a scarlet Geranium. The immense trees of white and red Brugmansia in the bed of this house are now in full beauty, as are also a noble Statice arborea, Tea-scented Roses, and many other favourite summer flowering plants.

Out of doors, as might now be expected, the garden is everywhere delightful. The noble standard Roses that occupy the borders on either side of the broad walk which leads from the school gate towards the conservatory are now blooming in the greatest possible perfection, and form an excellent succession to the Rhododendrons and hardy Azaleas, whose blossoms have just begun to fade away.

In the American Garden, Philadelphus chinensis is blooming freely, and among rare plants we remarked the Ledebour Honeysuckle (Lonicera Ledebouriana), a shrubby Californian kind, which promises to be an acquisition. Ceanothus thyrsiflorus we did not find in bloom, but it is certainly a fine addition to our evergreen shrubs. The severity of last winter has not hurt this nor Van Houtte's Ghent Alstrœmerias, which are pushing freely. The Chusan Palm has also wintered safely quite unprotected.

The plants in the beds on the east side of the Arboretum and elsewhere are now beginning to come into flower and grow away freely; but this has only happened within the last fortnight or three weeks, the coolness of the nights having before that very greatly checked the progress of vegetation. Fruit trees on walls had also been stopped in growth from the same cause, more especially Peaches and Nectarines, whose young wood is short compared with what it would have been under more favourable circumstances, and the leaves are inclined to curl. The opposite of this is, however, the case under Cottam and Hallen's glass covering or Peach frame, in which young shoots have grown freely, and the foliage is ample and healthy. The crop on the tree thus favoured, as well as on the open wall, which had the temporary protection of coping boards, &c., applied to it to keep off the spring frost, is a good average one. A considerable portion of the border along the Peach wall has been forked up, and has received a dressing of well-rotted manure; and since this has been done, and the nights have become warmer, the trees have grown more freely.

Some of the pyramidal Pears which were taken up from the open ground in March last, potted and placed in the Orchard-house (formerly the Rose-house) are fruiting; of Plums so treated, one little tree, of Early Prolific, has rather more than a dozen and a half of fruit on it, colouring beautifully. Denison's Superb will also ripen a few good Plums. Kidney Beans in pots, introduced among the fruit trees, have succeeded very satisfactorily in this house; while out of doors, owing to the coldness of the nights and soil, they have refused to grow, and even the underground part of the stem has in some instances presented an appearance resembling that caused by the Potato disease. The advantages of a house of this kind, not only for Kidney Beans, but also for Strawberries and things requiring a very slight degree of warmth in early summer, will therefore be apparent. The variety of Kidney Bean in question was the Newington Wonder, a good prolific sort; but for early forcing, the Haricot Noir de Belgique is reported to be preferable.

While speaking of Vegetables, Cock's white Cos Lettuce should not be forgotten. It is one of the hardiest white Cos varieties we have, standing the winter better than the Paris White Cos, which it resembles in quality; but the tops of the leaves do not hood over each other, and consequently it requires tying up for blanching. Laitue Romaine Verte Maraichére is also a good summer Cos, hardier than the white Paris. Laitue Chou de Naples is certainly one of the very best Cabbage Lettuces that is grown.

Of Turnips, a Cheshire variety, called Orange Jelly, is one of the handsomest and best sorts with which we are acquainted. It is round and regular in shape, with a small top, and a pale orange skin. Its flesh is yellow, juicy, sweet, and tender.

As regards Potatoes, it would appear that Mr. Alborough's plan of growing them, as described at p. 101, does not enable them to resist disease, at least in all cases, any more than other modes of cultivation; for in a trial of it made here the canker has already begun to show itself in the part of the stem that is below ground, exactly in the way in which it has always first presented itself here in former years. A plantation of the Fluke variety, planted in the usual way, is, as yet, healthy, the tops being robust and very dark green, and no brown shrivelled cuticle appearing underground. The haulm of all sorts is, as yet, apparently healthy, and we remarked no disease underground, except in the case just mentioned.

Some Portuguese Vines, thick stumps from the Alto-Douro, which had had their young wood destroyed by mildew, have been imported. They have been potted, and placed in a frame under glass, where two are pushing young shoots from the stem near the ground. Next month we shall therefore have an opportunity of reporting how they behave in regard to the disease.

It may interest some to know that the exhibition of fruit at the forthcoming *fête* on the 8th inst. will take place this time in the iron tent, where a circular stage of suitable size has been erected for its reception. It is to be backed up with Ferns and other plants placed in the centre; and, managed in this manner, it is hoped it will have a better effect than when shown, as it has been for some years past, in a long straight line.

FLORICULTURE.

Scottish Pansy Society.—The tenth annual meeting of this Society was held this year in connection with the last Caledonian Horticultural Society's June show. The attendance of Pansy growers was numerous and the competition spirited. The arrangements made by the Horticultural Society for the convenience of exhibitors gave universal satisfaction; and although some of the blooms shown on this occasion gave evidence of having suffered in quality from exposure to the cold cutting winds which prevailed for some time previous to the show, still, on the whole, the exhibition was a very fine one, which will be understood when we add that between 600 and 700 blooms were contained in the 48 competing stands which were brought forward. The following is a list of the awards:—Nurserymen: Best 18 blooms (5 competitors): 1st, Messrs. Downie and Laird, with Medora, Royal Standard, Father Gavazzi, Flower of the Day, Gliff, Miss Talbot, Yellow Climax, Beauty, Monarch, Countess of Strathmore, St. Andrew's, Emperor, Minerva, Jubilee, Marchioness of Bath, Uncle Tom's Cabin, and Sir J. Cathcart; 2d, Mr. Douglas, Murchiston Park, whose stand contained Diadem, Miss Talbot, Flower of the Day, British Queen, Sovereign, Emperor, No. X., Gliff, Marchioness of Bath, Fearless, Earl of Mansfield, Medora, Jubilee, Ellen, Aunt Chloe, Minerva, Mrs. H. B. Douglas, and Duke of Norfolk; 3d, Mr. Grieve; 4th, Messrs. White and Sinclair. Practical Gardeners and Amateurs: Best 18 blooms (9 competitors): 1st, Mr. Reid, Broomfield, with Lady Emily, Yellow Climax, Flower of the Day, Queen of England, Duke of Norfolk, Mary Taylor (seedling), Robert Burns, Fanny Kemble, Royal Visit, Marchioness of Bath, Miss Talbot, Lady Dundas, St. Andrews Duchess of Perth, Jubilee, Catherine Dundas (seedling), Sir J. Cathcart, and Charles Cowan; 2d, Mr. Shearer, gr. to the Marques of Tweeddale, with Yellow Climax, Disraeli, Lady Emily, British Queen, Sir J. Cathcart, Miss Talbot, Samson, St. Andrews, Royal Standard, Duke of Norfolk, Royal Visit, Flower of the Day, C. Cowan, Mrs. Blackwood, Sovereign, Mrs. H. B. Douglas, Aurora, and Sir J. Paxton; 3d, Mr. Henderson. Best 12 Blooms (12 competitors): 1st, Mr. Henderson, gr. to C. K. Sivewright, Esq., with Flower of the Day, Robert Burns, Yellow Climax, Duke of Perth, National, Gliff, Royal Standard, Duke of Norfolk, Adela, Miss Talbot, Sir J. Paxton, and St. Andrews; 2d, Mr. Young, gr. to Mrs. H. N. Ferguson, with Flower of the Day, Post Captain, Royal Standard, Lady Emily, Miriam, St. Andrews, Gliff, National, Sovereign, Lady M'Kenzie, Sambo, and Jubilee; 3d, Mr. Grandison; 4th, Mr. M'Nab. Best 6 Blooms (3 competitors): 1st, Dr. Stuart, with Marchioness of Bath, Telegraph, Lady M'Kenzie, Gliff, Diadem, and Flower of the Day; 2d, Mr. Niven; 3d, Mr. Walker. Amateurs exclusively: Best 6 Blooms (4 competitors): 1st, Dr. Stuart, with Marchioness of Bath, Gliff, Lady M'Kenzie, Telegraph, Robert Burns, and Lucretia (seedling); 2d, Mr. Fleming, Berwick, with Earl of Mansfield, Sovereign, Flower of the Day, Duke of Norfolk, and Pandora; 3d, Mr. Young. Classes open to all.—Best 12 Dissimilar Blooms—four light grounds, four yellow grounds, four selfs (12 competitors): 1st, Mr. Henderson, with Duke of Perth, Yellow Climax, Flower of the Day, Adela, Miss Talbot, Royal Visit, Miriam, Queen of England, Gliff, Sir J. Cathcart, Favourite, and Lady Emilie; 2d, Mr. Niven; 3d, Messrs. Downie and Laird. Best Dark Self in the room: St. Andrews, in Mr. Niven's stand, which was second in the prizes for Classes. Best Yellow Self: Sovereign, in Mr. Douglas's stand, which was second in the Nurserymen's Class. Best Yellow Ground: Jubilee, in Messrs. Downie and Laird's 18. Best Light Ground: Miss Talbot, in Mr. Henderson's stand. Sweepstakes (4 Competitors): 1st, Mr. Henderson, with Flower of the Day, Royal Visit, Gliff, Duke of Perth, Miss Talbot, Supreme, Yellow Climax, Jubilee, Pandora, St. Andrews, Sir J. Paxton, and National. To two, out of the number of Seedlings sent to this meeting for opinion, Certificates of Merit were awarded; the one named Omar Pacha, from Messrs. Dicksons and Co.; the other from Messrs. Downie and Laird, named Shylock; both dark. Omar Pacha is a flower in the way of Magnificent, but was considered superior in every respect to that variety, of excellent substance and colour, and good in shape. Shylock is a dark self, deep and bright in colour, and of fine form and substance. Both of the above flowers will be found valuable acquisitions. Mr. Stenhouse sent a yellow ground seedling, which was highly commended; as was also one in the same class from Mr. Shearer of Yester.

National Floricultural Society, *May* 25.—Mr. Hoyle in the chair. The subjects produced on this occasion were:—Azaleas, Shrubby Calceolarias, Cinerarias, Pelargoniums, Rhododendrons, and Pansies. A first-class certificate was awarded to Mr. Hoyle, for Pelargonium Wonderful; a large flower of good form, with smooth, stout petals; top dark maroon, shaded off towards the margin with orange and rose; lower petals deep pink, throat white; a free bloomer. The same raiser also obtained a certificate of merit for Serena, a flower of good substance; top dark, margined with rose; lower petals lilac rose, throat white; a smooth flower. A label of commendation was given for Lord Raglan, which is similar in colour to Prince of Orange, and very showy. A certificate of merit was also awarded to Pelargonium Grand Sultan (Turner), black top petals, under ones deep crimson, strongly marked—a striking flower. A label of commendation was awarded to Mr. Cole, for Calceolaria Dazzle.

June 15.—Mr. Beck in the chair. Mr. Smith had a first-class certificate for Verbena Boule de Feu, a brilliant scarlet, with yellow eye, and truss of fine form. Mrs. Latham, of Dover, sent a bedding Pelargonium called Carminia, which was awarded a certificate. Mr. Cole had a first-class certificate for Calceolaria Eclipse, a reddish crimson, of fine form and good habit. Mr. Dobson sent Pelargonium Mr. White, a carmine rose, with crimson maroon spot, smooth, with a good under petal; Gem of the West, a fine silvery white, with a pure claret spot, good in form and habit; certificate awarded. Mr. Beck sent Fidelio, a heavy rose, with maroon spots, and bright throat, under petals slightly spotted; Silenus, an orange scarlet, with brownish crimson spot, under petals clouded with the same colour—this was awarded a certificate; Conqueror, a good crimson scarlet, with rich maroon spot, good habit—received a first-class certificate; Laura, a good rose, with good spot, white throat, and moderate form. Mr. Turner exhibited a Fancy Pelargonium, called Ariel, which must be seen again, not being sufficiently in bloom. Of the Calceolarias, cut blooms, from Mr. Stone, of Hull, Aurora, Truth, and Gem were among the best; they are of fine form. E. Foster, Esq., of Clewer Manor, sent Pelargonium Phæton; a rich orange scarlet, stout, smooth, and of good form, a free bloomer—this was awarded a first-class certificate. Mr. Turner sent Pelargonium Pandora, with dark maroon top petals, edged with crimson; bottom petals crimson, free bloomer—awarded a certificate: also Fancy Pelargonium Ne plus ultra; dark purple maroon, edged with white, form good—awarded a first-class certificate: King of Crimsons; bright crimson, very showy, and possessing a free, good habit—certificate of merit awarded.

SEEDLINGS.

Pansies: *W J P.* Your yellow ground flower is distinct and well-shaped, with a good bold eye. It is of medium size, and we should say, if we may judge from the number of blooms sent, that it is constant. All the blooms (four) are uniform and good. The white ground variety is a fair flower, but not first-rate.

Roses: *Cultivator.* A very pretty Hybrid Bourbon, and delightfully fragrant.

Miscellaneous.

Oxalis tuberosa.—Under the name of Oca it appears that several varieties of this tuberous plant are known in Bolivia, whence they have been brought by M. Weddell. In the spring of 1853 some tubers, about the size of a pea, were received of the Oca Rouge from M. Vilmorin, and were raised in a Melon pit. Two of the plants were kept in the Vinery, and two were planted in the glass wall. The former died to the soil about the end of September without forming tubers. Those in the glass wall continued growing till killed by frost, Novem-

ber 17th. Their stems had grown in this situation to the height of five feet, with a healthy dark green foliage; but no flowers were produced. When the roots were taken up, it was found that numerous tubers had formed, some of which were fully an inch in diameter, roundish, or somewhat flattened, and having numerous eyes. The skin was smooth, in some parts of a pale straw colour, but mostly of a delicate crimson red. The roots have been taken up with the soil adhering, and covered with dry soil, in a cool Vinery. From the largest tubers strong plants may be expected, which will most probably flower. The tubers may be cut into sets like Potatoes. Possibly the Oca may be grown so as to produce tubers in this country, perhaps in warm soil and hot seasons without the aid of glass, except to forward it in spring. Although very imperfectly ripened, these tubres possessed little of the acidity that might be expected of an Oxalis, and which is spoken of by M. Weddell in the "Revue Horticole" (4th series, vol. i., p. 149). On the contrary, they were pleasant to the taste, perhaps resembling unripe Spanish Chesnuts as much as anything else, and being, in the opinion of persons of taste, at least equal to Rampions, as a raw esculent. The quantity raised in the garden was too small to allow of experiments in cooking them. It is intended to grow them more extensively next year; and, as they are likely to become of interest, the following account of them by M. Decaisne will prove interesting:—"The Oca is very extensively cultivated in the temperate parts of Bolivia, where several varieties of it are distinguished. Two are known by the names of Oca blanca and Oca colorada. The Museum is indebted to M. Bourcier for the latter, which he considers superior in quality to the Oca blanca, although M. Weddell is of a different opinion. The Oca blanca is beginning to appear in our markets; it is now to be found in most greengrocers' shops, but the slightly acid flavour of the tubers is disagreeable to some persons. This acidity may be converted into a sugary flavour by exposing them to the sun, which converts the acid into saccharine matter. This phenomenon is analagous to what goes on at the ripening of most fruits. The Oca, when treated in this way, loses all trace of acidity, and becomes as floury as the best varieties of Potatoes. According to M. Weddell the Oca should be exposed to the sun from six to ten days. In Bolivia this operation is performed in woollen bags, which appear to facilitate the conversion of the acid. To obtain this result, the bags should contain no more tubers than are sufficient to form a thin layer within the bag. If the action of the sun is continued for several months the Ocas become of the consistence and sweet taste of dried figs; they are then called Caui. The Caui is cooked by steam, the tubers being placed on a bed of straw, which keeps them from contact with the water over which they are cooked. In Bolivia, and more especially at La Paz, the Oca is cultivated to double the extent of the Potato. The price is also twice as high as that of the last-named vegetable. *Journal of Hort. Soc.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—This house should now be gay with such things as Achimenes, Clerodendrons, Allamandas, Gardenias, Stephanotis, and other showy plants from the stove; for without the assistance of these it is hardly possible to produce a first-rate display at this season. And if the house can be kept rather close, many of our most showy stove plants will be more at home here while in bloom than they would be in the stove; and the length of time which they retain their beauty renders it very desirable to grow them largely for this purpose. To do these justice, however, the house should be cleared of Ericas, and such plants as are soon injured by a close confined atmosphere, so as to be able to keep it closer and moister than would suit these; for very few of our stove plants will do any good in a temperature that is regulated for Ericas and such-like plants. If the permanent occupants of the beds and the twiners, however, are such as require a free circulation of air, the house must not be kept so close as to injure them. But where Passifloras, Ipomœas, Mandevilla suaveolens, Tecomas, Bignonias, &c., are grown for covering the roof—and Orange trees, and other things that enjoy a fair amount of warmth and moisture while making their wood, occupy the beds—the hardier stove plants will form the most suitable decoration for the next three months. Go over the twiners frequently, and regulate the growth before the shoots get entangled; but avoid keeping them tied too closely, for they are never seen to advantage unless they are allowed to hang in their own natural and graceful manner. Any sickly specimen must be frequently examined for insects, and means used to get rid of the pest immediately it is perceived, otherwise it will soon spread to adjoining plants, and be vastly more difficult to eradicate than if taken in time. It just occurs to us that it may be interesting to many buyers of new plants to learn that Achimenes Sir Trecherne Thomas is a splendid thing—good habit, fine round flower of medium size, and novel; very rich colour. A. Chirita, about which a good deal was said, is in the way of the old multiflora, with larger flowers; but, in our opinion, it is not nearly so fine a thing, and is hardly worth growing. Gloxinia Duke of Wellington is good, but not quite as fine as we expected that it would be. It is, however, well worth having, and is probably one of the best in cultivation. Stove.—The stock here will now be growing very rapidly, and must be afforded sufficient space to allow of the perfect development of the foliage and the formation of compact handsome specimens. The atmosphere of this house can hardly be kept too moist, and the plants should be sprinkled over-head morning and evening, and every available surface kept constantly moist. A slight shade will be indispensable for tender plants in active growth for a few hours on the forenoons of bright days, but this should be used as sparingly as is consistent with the perfect safety of the foliage. Plants that are known to suffer from the direct action of the sun's rays should be placed in a shady part of the house, or kept together at one end, where they can be shaded without interfering with plants that require plenty of light. Mealy bug and black thrips will require to be looked after here for some time to come, and the utmost diligence must be used to keep these pests in check. Orchids.—If previous directions have been properly attended to there will be little to do here beside attending to the ordinary routine of affording the plants a thoroughly moist atmosphere, repotting any specimen that may require it, and sponging the foliage as may be necessary to keep it perfectly clean.

FORCING DEPARTMENT.

Pinery.—If not already done, the plants expected to show fruit next January should have their final shift at once, in order to get the pots well filled with roots, and the growth completed before winter; for if they are kept growing into the winter it will be all an uncertainty about their showing fruit early in spring. Indeed there is no certain means of inducing the Pine to show fruit at that season, but getting the growth well matured in autumn, and allowing them a short rest, giving no more water to the soil than merely sufficient to keep the roots in health, and then subjecting them to a brisk heat. Treated in this way a supply of fruit at the expected season may be calculated upon with the greatest safety, but owing to the want of convenience and necessary means, or other causes, the plants are often kept growing when they should be at rest, and the result generally is that the plants start into growth in spring instead of showing fruit. Give plenty of clear manure-water to all the stock, except those being kept dry with a view to getting them to show fruit soon, and endeavour to secure rapid growth, now that it can be done without etiolation. Keep the atmosphere thoroughly moist, but avoid heavy syringings. Plants growing in the open bed must be well supplied with water at the root, giving a thorough soaking of manure-water as often as may be necessary. Vineries.—Attend to previous directions, keeping cool and moist where the fruit has been cut, in order to preserve the foliage in a healthy state as long as possible, and get the Vines well charged with organised matter, which will be of the utmost importance to next season's crop. Give plants, fruiting in pots, a liberal supply of manure water, as also those being prepared for the same purpose next season. Keep a sharp look-out for insects everywhere, and lose no time in eradicating them. Melons.—Young plants must have careful attention to keeping the shoots thin and regular over the bed, for there is no time to be lost after this season, if a crop is to be secured. Earth up as the roots reach the outsides of the hills, using strong loam, and making it quite firm, so as to avoid rank growth. Those swelling their fruit should be kept moist, but avoid frequent waterings of the soil by giving a good soaking. Examine the stems frequently for canker, and apply quick-lime to the affected part immediately it is perceived, first scraping off the decayed part; also avoid, as much as possible, cutting or mutilating the plants, and causing bleeding, which is the ordinary cause of this disease. Plants that have ripened their fruit and are in good health, if cut back, and the soil well soaked with tepid water, will soon start into growth, and set a second crop of fruit. They should not be allowed, however, to carry a large crop.

FLOWER GARDEN AND SHRUBBERIES.

Late sown annuals should be thinned out as soon as they are well above ground, for if left to grow too thickly they spoil one another, and never make half the display plants do that are allowed plenty of space, and which are grown strongly from the first. Attend to staking such of the herbaceous plants as require it before they get blown about and injured, and do not huddle the stems together, as is too frequently done. The early flowering bulbs, as Tulips, Hyacinths, Turban Ranunculuses, &c., will now be ready for taking up, and should not be left in the ground after the decay of the foliage, as, if wet weather occurs, they will be making fresh roots, which weaken them for next season. On light dry soils American plants will be greatly benefited by a good soaking of water after flowering, and the finer specimens should be mulched, to assist in keeping the roots moist during the growing season. Attend to the propagation of the better varieties of Pentstemons, which are exceedingly useful plants; also see to having a good stock of the border Picotees and Carnations, which are invaluable for cutting; and although now discarded from the parterre, should not be overlooked. Cuttings of these, if put in before the wood gets too hard, root as freely as Pinks.

FLORISTS' FLOWERS.

Pinks will still demand extra care. The pipings, or Grass, may be taken off, cut across at the second joint, and placed under hand-glasses on a gentle bottom-heat; they will soon strike root. Carnations and Picotees should be disbudded immediately. Occasional waterings with weak liquid manure will still be found serviceable. Offset Tulips which are turning yellow in the foliage may be taken up, placed in paper bags with the name written outside, and hung up in a place where there is a free circulation of air. As the bulbs on the main bed become fit to remove, place them in their proper compartment in the cabinet; the skin and root may remain on till thoroughly dry, when they may be safely removed. Water Dahlias during dry weather; it will also be serviceable to mulch the surface of the soil with rotten manure. Trap earwigs and other destructive insects.

HARDY FRUIT AND KITCHEN GARDEN DEPARTMENT.

Proceed with nailing in the young wood of wall trees, and see that they are perfectly clear of insects; also stop any gross shoot, and endeavour to secure a fair supply of bearing wood all over the tree. Gross shoots that were stopped early in the season should be divested of all the laterals except one, or, if they can be spared, removed altogether. Keep the breast-wood on Pear and other wall or espalier trees closely stopped in, and attend to thinning the fruit where the crop is too heavy for the strength of the tree. Look to preparing Strawberry runners for forcing next spring. If not already done, a good breadth of Brussels Sprouts should be planted on very rich deep soil; for if not got in at once, the crop will be but poor, and it is very desirable to secure a good supply of this most useful winter green. A fair supply of Savoys and Broccoli, &c., should also be planted at once. Continue to plant out Celery as ground can be spared, and keep it well supplied with water. Cauliflowers and other strong growing things will be greatly benefited by an occasional watering with manure-water. Keep the hoe in action on dry days; cut Box edgings in showery weather, and endeavour to have all neat and clean.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending June 29, 1854, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 5th, 1852—therm. 97 deg.; and the lowest on the 4th, 1851—therm. 37 deg.

Notices to Correspondents.

Ferns: *G N.* Shake your Fern seed over finely sifted peat and sand pressed firmly in a garden pot. Place it in a damp shady hothouse, and leave it to its chance. If *good* it will grow without further precaution. Should circumstances prevent your keeping the house damp, then you must place a bell-glass over it. You may try the experiment at any convenient season.

Fruit-trees: *Tamina.* It is impossible to say what has been the cause of disease in your Espalier Apple-trees, without knowing the condition of the roots; whether these have got into a subsoil of naturally bad composition, or one too wet or too dry. Dead and dying branches frequently result from excessive dryness at the root, taking place after several previously wet seasons. It is not likely that the iron wires to which the branches are trained would have caused these to canker, especially if the wires have been kept painted, as they ought to have been.‖

Insects: *J R.* The Ribes sanguineum is infested by numbers of females of a scale insect, which appears identical with that of the common Vine. The minute larvæ are being hatched in vast numbers from the midst of the downy matter, so that not a minute must be lost in cleansing the tree, by rubbing off as many as possible, and then painting the stems over with a mixture of soft soap, sulphur, a little spirits of turpentine, and some tobacco-water.—*J C M.* Your Strawberries are attacked by numbers of the millepede Julus pulchellus. Your ground must be very foul. Sink some slices of Potatoes, or some damp Moss, in different places in your beds, and examine it every other morning, and destroy the Juli.—*S X.* The black insects on your Bean stems are the common aphis Fabæ. They will certainly be detrimental to the crop. Dip the plants in lime water, and syringe well with plain water. *W.*

Names of Plants: *A S.* We are obliged to request a short delay in answering the inquiry from you and another correspondent.—*Hill Street.* It is an Aristolochia; what species we will say next week.—*Flora.* Apparently Clerodendron Kæmpferi.—*F H S.* Rhododendron ferrugineum, and some Poplar or Willow. The wool has no value that we know of.

Hollies: *Lichfield.* Your Hedgehog Holly has died of being transplanted in April—you should have taken the end of August. If the smooth Holly is recovering you have been fortunate.

Pelargonium: *Ignoramus.* A Pelargonium has irregular flowers, with a deep canal leading from the bottom of its cup some way down the flower stalk. A Geranium has regular flowers and no canal.

Strawberries. *J K.* The Strawberry, which you have named the Carolina superba, partakes of the flower of the White Carolina; but the fruit was bruised by carriage, so that the paper, which accompanied the Strawberries, was saturated with juice; and this juice dried on the paper like syrup—sweet, adhesive, glossy, and brownish coloured. Strawberry juice does not usually possess these properties.‖

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

TURNIP SOWING.

SUPERPHOSPHATE OF LIME, made from Bone, which is the best Manure for Root Crops (see the Royal Agricultural Society's Journal, Vol. vi., part 2). PERUVIAN GUANO, NITRATE OF SODA, BONE DUST, SULPHURIC ACID, and all other Manures of known value. The PEAT MOSS CHARCOAL COMPANY have appointed the undersigned Sole Agents for the Sale of this fixer and distributor of Ammoniacal matter. They are also Sole Agents (in London) of the Patent Sanitary Company for the sale of their "Nitrogenised Carbon."—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

SUPERPHOSPHATE OF LIME, for Turnip Manure, Guano, Bone Dust, Sulphate of Ammonia, Gypsum, Agricultural Salt, Grass Manure, and other Fertilisers, of superior quality, on sale, at the Coprolite Mills, Durham Wharf, Deptford Creek, Greenwich.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.
WM. INGLIS CARNE, 10, Mark Lane, London.

PEAT CHARCOAL, free from adulteration of any description, the finest Deodoriser known, and afterwards forming one of the most valuable Manures. Invaluable in Private Houses, Hospitals, Cesspools, &c., and tends more than anything known to the sanitary condition of a City. Prices, free on board in Dublin, 40s. per ton; sacks charged only half price when returned in good condition, free of expense. To be had in any quantity on application to the WIGAN COAL COMPANY, 4, Luke Street; Mr. S. FRAZER, Ironmonger, Mary Street; Mr. G. READE, 113, Grafton Street; or T. BRIDGFORD & SON, 48, Lower Sackville Street.—Dublin, July 1.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4l. per ton, and in quantities less than half a ton, at 5s. per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London: and from all the other Agents of the Company.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

NOTE.—By employing this Manure, at least half the cost of the best Peruvian Guano is saved, and, at the same time, all its valuable effects produced.—*See Certificates.*

THE "ECONOMICAL" MANURE.—The reports from this year's customers fully support the high character this valuable Manure obtained last year, and parties in immediate want of manure can be supplied with any quantity on the shortest notice. 1½ to 1¾ cwt. per acre is the proper quantity to be used, and must not be exceeded. Price 12s. per cwt., packages included, and put free on to the Railways in London, Manchester, or Birmingham. All particulars in the Company's pamphlet, to be had gratis, with samples, at the BRITISH ECONOMICAL MANURE COMPANY'S OFFICES, 10, Mark Lane, London, or sent free on applying to
BENJAMIN COVENEY, Manager.

NOTE.—For Turnips and Root Crops generally, where the seed is sown or the plant out of the ground, and in cases where from any cause it is weak, this Manure, mixed with about its own quantity of earth or ashes, may be put on the surface with great effect, and will be found to speedily force the growth of the plant, and give it an extraordinary vigour; or, as it quickly dissolves, it is not too late to apply it as a top-dressing for grain crops where the plant is sickly or the crop patchy.
All orders promptly executed.

*** Parties are referred to this paper of the last few weeks for the letters of those who have used the Manure with great satisfaction this year and last.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

BALANCE OF FACTS IN FAVOUR OF RICHMOND AND CHANDLER, who have, in competition with the best selected CHAFF CUTTERS of the most celebrated makers in the trade, carried off the highest prizes against all comers.

COPY OF TESTIMONIAL.
"Early Court, Reading.
"GENTLEMEN,—I beg to hand you a cheque for your Corn Crusher; I must add, at the same time, that nothing can exceed the goodness of the Machine. I have found in it all I can wish, and, moreover a very superior finished Machine, and a pattern for other makers. (Signed) "GEO. SHACKELL.
"Messrs. RICHMOND & Co."
Address—RICHMOND & CHANDLER, Manchester; and South John Street, Liverpool.

CHAFF-CUTTERS, of the best workmanship, 25s.; Two-Knifed Chaff Engines, from 63s.; Mills for Bruising Oats and Beans, from 45s.
WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

BARTON'S PATENT STABLE FITTINGS AND ENAMELLED MANGERS.—These Fittings have all the newest improvements, and are the only patented invention of this description.
JAMES BARTON, Iron Founder, Smith, &c., 370, Oxford Street, a few doors East of the Pantheon.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

YORKSHIRE AGRICULTURAL SOCIETY, open to the United Kingdom.—The Seventeenth Annual Meeting will be held at Ripon, on the 2d and 3d days of August next. The entry closes on the 19th of July. Free transit for Stock, and half rates for Implements are conceded by the railways of the district, except the Great Northern Railway Company, who have declined this concession. Prize sheets and forms of Certificates are now ready, and may be had on application to the Secretary.
Kirk Deighton, Wetherby, July 1. JOHN HANNAM, Sec

BATH AND WEST OF ENGLAND SOCIETY FOR THE ENCOURAGEMENT OF AGRICULTURE, &c.
PRIZES FOR ESSAYS 1854.

Cereal Crops	£15	0	0
Dairy Management	15	0	0
Water, Animal and Steam Power, applied to Agriculture	15	0	0
Agricultural Dwellings	15	0	0

The particulars of the Subjects to be treated of, and the Conditions of Competition, may be had on application to H. St. JOHN MAULE, Secretary, Bath, or N. ROBERTS, Assistant-Secretary, Exeter; to whom all Communications for the Editor of the Journal may be enclosed.
The Journal Committee are authorised to remunerate writers of papers on other subjects in certain cases at their discretion.

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.—The Society's SHOW AT ARMAGH, in the Province of Ulster, will take place on the 9th and 10th of AUGUST next, when Premiums and Cups to the amount of 1200l. will be offered to competition for Farm Stock, Implements, &c.
Very favourable arrangements have been made with various Railway and Steam-Boat Companies for the carriage to and from Armagh, of Stock, Implements, &c., duly entered. Thus the Companies of the Ulster, the Ballymena, the Dublin and Drogheda, the Dublin and Belfast Junction, the Dundalk and Enniskillen, have agreed to carry all articles to and from the Show free, so also has the County Down Railway, excepting Horses. The Southern and Western, and the Great Midland Railway, will charge on articles going, but make no charge on articles returning, provided they have not been sold, or have not changed hands.
The City of Dublin Steam-Boat Company will carry to and from Dublin and Belfast, free by their boat, once a week; and the Belfast Steam-Boat Companies will charge articles going to the Show, but carry free those returning unsold.
The Committee have also arranged with the Agents of the Whitehaven, Morecombe, Ardrossan, Carlisle, Greenock, Glasgow, and Stranraer Steamboats to convey Stock, &c., at half freights to and from Belfast.
All entries must be lodged not later than 19th July.
Prize Sheets, and Forms of Entry, to be had on application to ROBERT COCHRAN, Esq., Secretary to the Local Committee, Armagh; or, to me, at the Society's Offices, 42, Upper Sackville Street, Dublin. THOMAS HARKNESS, Secretary.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—PROGRAMME of LINCOLN MEETING.
THURSDAY, July 13.—Trial Yard open at Twelve o'clock at noon, when the public will be admitted, at Ten Shillings for each person, to view the Trials of the Steam-engines.
FRIDAY 14, SATURDAY 15, MONDAY 17, TUESDAY 18.—Trial Yard open at Nine o'clock in the forenoon, when the public will be admitted on each day at Ten Shillings for each person, to view the Trials of the Steam Engines, Barn Works, and other Agricultural Implements and Machinery generally.
WEDNESDAY 19.—The Implement Yard open to the public from Seven in the Morning till Six in the Evening; admission, 2s. 6d. each person.
The Judges to inspect the live stock and award the prizes.
At One o'clock (or as soon after as all the judges shall have delivered in their awards) the public to be admitted into the Cattle Yard, and to the Exhibition of Farm Poultry, on the payment of Ten Shillings each person, at the Special Entrance; Members of Council and Governors of the Society being admitted by Tickets to be purchased at the Finance Department of the Society at the Show Yard.
N.B. Notice will be posted up over such entrance when the judges have completed their awards. At Eight o'clock in the Evening the Yard will be closed.
The Dinner of the Society in the Pavilion adjoining the Show Yard, at Four o'clock: the doors open at Three. The Judges' Awards of Prizes for Live Stock will be read.
THURSDAY, 20.—The General Show Yard of Cattle, Horses, Sheep, Pigs, Farm Poultry, and Implements open to the public from Six o'clock in the Morning till Six in the Evening; admission 2s. 6d. each person.
FRIDAY 21.—The General Show Yard open to the public from Six o'clock in the Morning till Six in the Evening; admission One Shilling each person.
General Meeting of the Members in the Guildhall, at Ten o'clock in the forenoon.

The Agricultural Gazette.

SATURDAY, JULY 1, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, July 5—Agricultural Society of England.
THURSDAY, — 6—Agricultural Imp. Society of Ireland.
WEDNESDAY, — 12—Agricultural Society of England.
THURSDAY, — 13—Agricultural Imp. Society of Ireland.

WE have received samples of bine, indicating the miserably blighted state of the HOP PLANTATIONS IN KENT. The attack is so late and so severe, that recovery seems hardly possible. On this subject we may refer the reader to an extract in another column from Mr. PAINE's admirable article on the Hop in BLACKIE's "Cyclopedia of Agriculture."

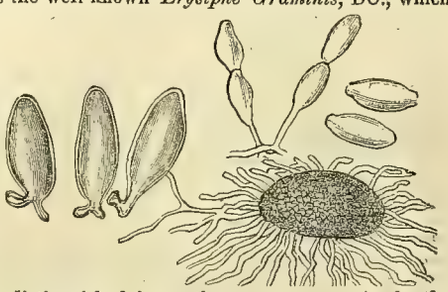
WE have received from Cirencester the examination papers by which the agricultural intelligence of the students at the College has just been tested. The whole series, from the commencement of these sessional examinations, already forms a very full catechism of the practice and science of cultivation; and we believe that it might be usefully consulted by those who select the subjects to which the English Agricultural Society annually directs the attention of its essayists. We remember hearing, at one of the late weekly meetings of that Society, the remark made that members would render good service by suggesting useful subjects, from which the annual list might be compiled. It may be allowed us to refer those who have charge of this matter not only to the catechism thus in process of edition by the Professors of the Royal Agricultural College, but also to a list of 150 subjects prepared for the use of Farmers' Clubs, and published in this journal some years ago (No. 50—1845).

As regards the former, or the contribution to it of this session, we add that we have been promised permission to select from among the returns to these papers such replies, especially in the agricultural department of the examination, and in that of agricultural chemistry, as may be interesting to our readers. We are glad to know that previous publications of this kind have contributed, as they naturally must, to extend the reputation of the College, which is rapidly rising to that position in the estimation of the agricultural body which it has now for a long time deserved.

SERIOUS complaints are made in the public journals of a new disease which is attacking the Wheat, both in the east and west of England, appearing at the base of the stems in the form of little mouldy patches, and ultimately affecting the ear. The disease, however, is by no means new; it is well known, not only in this country but on the continent, and is far from being confined to Wheat, but luxuriates equally on other cereals, and on many indigenous Grasses. It is mostly confined to the sheaths of the leaves, and, when that is the case, does not affect the ultimate produce much more than rust or other diseases confined to the foliage. Indeed, we have never seen it do serious injury, but it is asserted by LÉVEILLÉ that it sometimes prevents the production of perfect corn, and the testimony of several observers seems in favour of such a view during the present season. It is, however, by no means so general an affection as rust, and we trust that the ultimate injury will not be serious, or at least that the disease will not be likely to maintain its virulence.

Its comparatively rare occurrence may perhaps be owing to the circumstance that true sporidia do not seem to be produced in the sporangia, except in very warm districts. Our specimens are without this form of fructification, and such was the case with samples received by Dr. LÉVEILLÉ from different parts of France, though Dr. CASTAGNE had found individuals with fruit in the provinces of the extreme south.

The parasite, to whose presence the disease is due, is the well known *Erysiphe Graminis*, DC., which



is distinguished from other common species by the sporangia having numerous white filiform appendages, mixed with the creeping mycelium, which forms cushion-like spots. The naked spores of the mycelium are oblong, with a constriction frequently at either extremity; the asci are large and oblong, and in CASTAGNE's specimen contain eight sporidia. We have represented one of the sporangia magnified, with its appendages and mycelium, some of the naked spores fallen and *in situ*, more highly magnified, and three of the asci under the same magnifying power. *M. J. B.*

THE analyses of the "Economical" manure, in another column, indicate a very variable composition, not only as to the proportions, but the actual presence of its ingredients. The former might well arise from the difficulty of taking an average sample—the crystals of the several substances being left of considerable size, and the whole being very imperfectly mixed; but the entire absence of gypsum from some samples, and its presence in large quantities in others, cannot be explained in this way.

We have been asked to delay our publication of these analyses until the result of this year's experience of the manure is known; this, obviously, we cannot do. The actual composition of the substance is an independent fact, of course altogether unaffected by those results for which we are asked to wait; and we should long ago have published it, had our attention been earlier directed to it, as we much regret it was not. We

remember, some years ago, a discussion arose as to the relative economy of spending 10*l.* on oilcake or guano. In the comparison of the two that was made, it was urged that a ton of guano, distributed on the several crops of a rotation, would produce so many more cwts. of hay—so many more bushels of Wheat, Barley, and Beans—so many more tons of Turnips, &c., and *these* were valued in order to get at the effect of the investment in the manure; whereas, on the other side, it was said the oil-cake, besides its increased produce of meat, would result in so much manure at 3*s.* 6*d.* per cubic yard, one-third of which might be put to the credit of the purchased food. So credit was taken on the one side for the *market value* of the manure, and on the other for *the agricultural effect* of the manure, and this we thought not fair towards the oilcake; for the agricultural effect, and not the market value, was the point which alone determined the question at issue—namely, the "economy" of the investment in guano and oilcake respectively. The case is altogether different in the instance before us—the "economy" of an investment in the "economical" manure is determined, previous to any known results of its application, by the actual market value of its ingredients—and these, accordingly, we have given in another column, and should long ago have given had we known them. Analyses by Dr. VOELCKER, Professor APJOHN, and Mr. NESBIT, must be considered conclusive, and to the remarks by the two former gentlemen we direct the attention of our readers.

We understand the manure to have arisen out of some plan proposed, and, if we mistake not, patented, by a French gentleman for the better management of farm manure—in which alum and iron salts were employed, with the alleged effect of hastening decomposition, while, at the same time, the products of that decomposition were fixed; and even now, the "economical" manure is, we believe, recommended for its usefulness, not only independently, but as an agent in the economical management of farm-yard dung. Be this as it may, it is plain that whatever value the mixture possesses may be attained, at about one-third the price at which that is sold, by any one who shall be at the pains to purchase the ingredients, and grind them together himself. We enter here on no discussion of the agricultural value of the substance, or of the curious questions arising out of the many published testimonials to this point, on which we throw no doubt whatever—it is sufficient, for the present, to have pointed out the market value of the ingredients of which the manure is compounded, and the consequent inaccuracy of the title claimed for their mixture.

AGRICULTURAL STATISTICS.

THE want, at this season of the year, of some more reliable data than what newspaper reports afford of the good or bad prospects of the coming harvest, has become a subject of general complaint, and whilst the dependence of this country upon foreign supplies of corn renders it of immense consequence to us, and which dependence every year is increasing, there is nothing being done by Government to supply it. The extent to which this country is dependent on foreign supplies of food, and the rapid advance our imports have made in the last 35 years, are matters for serious consideration. In the seven years ending 31st December, 1834, the importations of Wheat and wheaten flour amounted to 7,400,000 quarters; in the next seven years, to 10,300,000; in the following seven years to 16,400,000; and in the six years ending 31st December, 1854, they will have attained the enormous amount of 30,000,000 quarters, (upwards of 25,000,000 having been received in the five years to the end of 1853); so that our imports of bread corn in 34 years have increased from one to five million quarters per annum (the imports of other grain and of cattle having gone on increasing in something like the same proportion), and we are now dependent on these supplies for one-fifth of our consumption, (this year our wants having been one-third). To a country so situated, some general and carefully estimated return of the prospect of the coming harvest must always at this period of the year be wanting, and is this year particularly so, as, during the approaching 12 months, we shall be more than ever dependent upon our own growth; for we shall begin our consumption immediately at harvest on the new growth, with no stock of old to assist it; foreign granaries, like our own, will be empty, and the supplies from abroad for the next 12 months must be very small. There are other considerations, too, which this year increase the importance of an early preparation for a moderate harvest—among which we must not omit that we are not likely to get any supply from the Black Sea or Russia, countries which have been giving us nearly half our supplies.

I do not know what means the French Government has of calculating its resources; but, judging from the very accurate information it promulgated last year of its approaching harvest, and the early steps it took to meet the deficiencies, it must possess a machinery of considerable value. As early as June last year, the French Government commenced purchasing Wheat in England, and were enabled, for several months, to buy of us, under 45*s.* per quarter, what we had afterwards to replace at 70*s.* to 80*s.*; and to encourage importation the French ports were early thrown open to vessels of all countries to receive grain and corn duty free. All taxes and duties on transit were repealed, and a flow of food into the country was encouraged by every means. At the same time all export was prevented; and by this early vigilance the markets all through France have been kept supplied at prices from 10 to 20 per cent. lower than in England, notwithstanding that France has had no foreign resources to apply to that were not open to this country. So we see that France possesses a machinery for acquiring information which we are without; and by possessing this machinery, was enabled to foresee its approaching wants, and, foreseeing them, to take measures in time to supply them—and did so, partly by drawing supplies from this country, and partly by forestalling us in the markets we had to apply to—and in this way it gained its foreign supplies at a cost greatly below what we have had to give, and still more so, as compared with what it would have had to have paid had England as early been in competition in seeking its own supplies. But for this information, and its early wise measures, France would not have sought its supply sooner than we; none of the Wheat we exported at so much loss to the country last autumn would have left us, and it is probable that much of the supply to France would have been obtained through our merchants, and corn must have been as dear in France as in England. It is a fact, ominous of the coming wants of France, and worthy of our notice at this moment, seeing the information it obtains and the grounds upon which the French Government act, that it has within the last week extended the period for the receipt of grain duty free, and its other measures to encourage importation, and prevent exportation, to the 31st December (and the King of Naples has done so also), the more especially that the reports from the farmers of this country are conflicting, for whilst they agree in the good appearance of the crop as regards the quantity of straw, they by no means speak well of its healthy character; and seeing how dependent we are on the weather, even with the best promises, and that we can place little reliance upon foreign resources to supply any home deficiency in the coming year, a Government enquiry that should embrace all Britain, both as to the prospect of the coming crop and of the stock on hand, is particularly needed. *Hewitt Davis, June* 28.

THE AGRICULTURAL COLLEGE.

THE Sessional Examination of the students was brought to a close last week. The following are among the results of it:—

EXAMINATION IN PRACTICAL AGRICULTURE.
First Class, in order of merit.

Chancellor	Fell	Molony
Austen Leigh	Bowstead	Brickwood
Wakeman	Palmer	Myatt
Hester	Rome	Morgan
Wilkinson	Cheales	Rotheram
Broughton	Mant	W. Browne
Owen	Peckitt	Field
Kitchener	Tousey	Cuppage
		Hawthorn

The following were at the head of their class in the other departments:—

ORGANIC CHEMISTRY.
David Fry——Horatio Chancellor (equal.)

INORGANIC CHEMISTRY.
1st, T. F. Wilkinson 2d, E. D. Brickwood

VETERINARY MEDICINE AND SURGERY.
1st, Horatio Chancellor 2d, R. R. Stephens, Leonard F. Peckitt

GEOLOGY AND ZOOLOGY.
1st, Matthew Fell, 2d, Lonsdale Bradley, Horatio Chancellor, W. R. Whiteway

CIVIL ENGINEERING AND SURVEYING.
1st, Lonsdale Bradley 2d, George Mant

THE PRIZES FOR THE BEST REGISTER OF CASES AT THE VETERINARY HOSPITAL WERE ADJUDGED TO
1st, L. F. Peckitt | 2d, E. D. Brickwood | 3d, Thomas Rome

THOSE FOR THE BEST LABORATORY BOOKS TO
1st, David Fry | 2d, F. Tombs | 3d, Thomas Bowstead

THE PRIZE FOR THE BEST ESSAY ON AN AGRICULTURAL SUBJECT TO Horatio Chancellor.

THE PIG.—No. II.

THE BREEDING AND MANAGEMENT OF PIGS—*continued from page* 410.

The Chinese Pig.—This breed of pigs is composed of many varieties, if not perfectly distinct kinds, and they are distinguished by many peculiarities in colour, frame, and general features. The true-bred best white Chinese pigs are beautifully white, both in skin and hair. The general character of the Chinese breed may be taken as follows. The skin is remarkably thin, and will divide or break into crevices when the animal is highly fed. The hair is thinly set, and rather soft, with a few fine bristles. The snout is rather broad, with short head, and wide cheeks, almost overhung by an immense neck; the eyes bright and fierce, and very small fine prick ears; broad, high chine, so that, with the neck, if neck it can be called — for when fat it partakes much of the general carcase — combined with a short back, broad loin, short thighs, and a belly nearly trailing on the ground, from the extreme shortness of its legs, and still shorter tail, the whole would, as has been fitly observed "resemble a well-filled feather bag, without shape or symmetry." It is a most uncommon feeder, eating any kind of food, and becomes in every part so fat and well fed, that only a very small part of the snout is useless offal. The flesh is very delicate and fine meat, when fed upon meal, and not made too fat; but if farinaceous food is withheld, and the feeding should partake much of animal matter, or oily compounds, the flesh itself becomes all fat, oily fat, and the thin delicate skin will crack, and display through these crevices the almost liquid fat beneath. The prevailing tendency of this particular breed is to accumulate fat; and its great fault, the absence of lean flesh. When well fed they will, at 18 months, attain to about 14 stones imperial in weight; and at two years, when they have reached their growth, they will weigh about 18 stones imperial. If allowed to roam at pleasure, without extra feeding, such is their tendency to fatten that they make excellent porkers. The sows, though prolific breeders, are notoriously bad mothers. The Chinese breed have been subdivided into at least seven varieties; and, like our own, these may be indefinitely extended. There is the white breed, with black or sandy heads; ears standing better, and narrower foreheads. The white small breed: this is a remarkably small animal, almost perfect in make and quality. Parkinson says:—"These are certainly pigs in miniature; their legs about 2 or 2½ inches long; ears the size of a large leaf on an Apple tree; the length of the jaw, from the snout end to the crown, about 6 inches; from the crown to where the tail is set on, about 2 feet; height about 12 inches; weight, when full grown and fat, six stones at two years old. The black variety of similar shape and beauty; this will come to a somewhat larger weight when fat. The black breed, with bald faces: these are similar to the first named; they are more prolific, quicker growers, hardier, and come to heavier weights. The large black breed: this is the largest of the Chinese breeds, and are of fine formation and great beauty; they attain great weights when well fed, reaching, in extreme cases, to 40 stones. The black and white Chinese breed are not so well made, their general character denoting careless breeding—coarse and ill-formed throughout—but they are better breeders and better nurses. The sandy, copper-coloured, or blue Chinese breed or breeds are of the larger kind, but differ little from them, except in colour. We may observe that the improvement in the breeding of the pig has not been altogether on one side from crossing with the Chinese; for although they have given more correct proportions, greater propensity to fatten, and vastly improved quality to the English pigs, yet the cross with the English breed has given the Chinese a far greater proportion of lean flesh than they originally possessed. We may further observe that it is the Chinese pig, or sub-varieties of it, that is to be found in all the eastern countries and the islands of the eastern seas; throughout Australia or the Polynesian Islands, and in some parts of Africa and the islands lying contiguous thereto.

The Maltese, Neapolitan, and other breeds of the countries bordering the Mediterranean.—These breeds are so much alike, that for the most part the description or outline of one breed will suffice for the whole. The Neapolitan pig is the progenitor of most of the improvements in our smaller breed of pigs, and more particularly of our small black species. It is to this variety that they owe their beauty of feature and frame, and their delicacy of flesh. They are nearly perfect models of the pig—compact in form and of beautiful symmetry, small in bone and offal (if offal there be), fine snout, head rather longer, with a full, plump round form, of somewhat shorter proportions than the Chinese, but altogether slightly larger in frame; they are almost without either hair or bristles, and their colour is nearly jet black. They are capital feeders, and thrive well on ordinary food; are fair breeders and good sucklers. Their predominant and most valuable trait is their extraordinary propensity to fatten at a very early age, and they produce meat of unequalled flavour and delicacy. From these two classes or breeds of pigs have sprung our principal improvements; but they have long become so intermingled with our native breeds as to preclude the necessity of resorting to this cross again. It is far better to adopt some of our improved breeds than to attempt to form a new one, which we shall attempt to show in a few remarks upon choosing a breed of pigs.

The Breeding of Pigs.—Every judicious breeder desires to propagate that breed which will yield him the greatest profit. He will have to take various circumstances into consideration; he will have to consider what course he should adopt, whether to breed for sale as stores or for fattening; his facilities for sale and for obtaining economical supplies of food; the proximity of a good market, and the peculiar demands of the population in the locality of his residence; the adaptation of his farm or other appliances for fatting or for rearing as stores; his chances of a regular sale, either as porkers, bacon hogs, or store pigs—which is likely to pay him best, and which can he most economically and profitably prepare for market. Considerations like these will direct him in the choice of a breed. Having come to a decision as to the course he will adopt, he should then visit our best agricultural shows, and, instead of attempting to breed a variety for himself, he should purchase animals of the best character he can meet with, not being remarkably fastidious either about price; good animals from acknowledged breeders are always valuable, and are best worth having. He must bear in mind one thing, and that is, that it matters little whether the breed chosen be the large or the small breed; he must see that he obtains the same general contour of frame; the same general characteristics of make and form; he must look for the compact form—

the broad chest—the wide loin and chine, the spring of rib, and depth of carcase. He must look for the well-formed head, with a sprightly, calm-looking eye, full cheek, small mouth, snout end fine, forehead rather narrow and convex, short ears and thin, and pointing forwards—the whole denoting docility. He must look for thin hair, with few bristles; lightness of offal, uniform colour; supple, thin skin, short legs, and fine bone; and that the whole animal shall exhibit a compact symmetrical frame of great beauty in form and feature. *J. C.*

AGRICULTURAL CHEMISTRY.

SESSIONAL EXAMINATION.—ROYAL AGRICULTURAL SOCIETY.

[We publish in a condensed form the replies of Mr. J. H. Barker on the following subjects.]

2. Sources of ammonia.
3. Sources of carbonic acid gas.
10. Adulteration of nitrate of soda.
15. Value of wood ashes as manure.
17. Alumina in soils.

2. AMMONIA is detected in rain water by adding a few drops of sulphuric acid to about 20 gallons, and evaporating it, when sulphate of ammonia will be left. You take such a large quantity of water on account of so small a quantity of ammonia being contained in it, and you add the sulphuric acid to it, so as to fix the ammonia; the sulphuric acid unites with the ammonia, forming the sulphate of ammonia, which is not volatile at the temperature required for evaporating the water. To prove that ammonia is contained in the residual salt, you add a little quicklime to it. The sulphuric acid having a greater affinity for lime than for the ammonia, unites with it, forming sulphate of lime, and the ammonia is given off, and can be detected either by smell or by holding a glass rod dipped in muriatic acid over it, when white fumes of muriate of ammonia will be produced.—Ammonia is given off into the air when organic substances containing nitrogen decompose. Our crops generally look very much invigorated after a thunder-shower; this is no doubt partly due to the nitrate of ammonia contained in the water, the electricity of the atmosphere having united a small quantity of the oxygen and nitrogen in the atmosphere, forming nitric acid, and this, uniting with the ammonia, forming nitrate of ammonia, which is brought down by the rain, and thus stimulates our crops.

3. The principal sources from which carbonic acid is derived are, the expiration of animals, all animals breathing it and taking in oxygen; a full grown man breathes out 10 oz. of carbon in this form every day. 2d, it is always given off when organic substances decompose; 3d, all our fires are a continual source of it; 4th, it is given off from plants during darkness.

10. You detect the presence of common salt in nitrate of soda by dissolving a little in water, and adding to the solution a little nitrate of silver, when, if it be present, a white precipitate will be formed, the chlorine of the common salt uniting with the silver, form the insoluble chloride of silver. When nitrate of soda is thrown on the fire it should produce no noise, but make the flame burn brighter. If it contains common salt, a crackling noise will be produced.

15. Wood ashes are more valuable than coal ashes, on account of their containing so much more carbonate of potash, which is the principal fertiliser of these substances. Wood ashes contain about 40 or 50 per cent. of carbonate of potash, and on this account they are worth five or six times as much as coal ashes. They vary, however, as to the quantity of this potash salt which they contain, those made from leaves and young branches containing far more of it than that made from old wood. As plants require a large quantity of this salt, we see that this constituent must be contained in every fertile soil.

17. Alumina occurs in the soil chiefly in the form of silicate of alumina and as hydrate of alumina. Alumina is composed of two parts of aluminum and three parts of oxygen; and silicate of alumina is composed of one part of alumina and one part of silicic acid. Silicate of alumina in a pure form is pipe-clay; earthenware is composed chiefly of silicate of alumina, but besides this it contains oxide of iron, which gives it its reddish colour—the more oxide of iron the redder the colour. All soils, except those of a purely sandy nature, contain more or less silicate of alumina; it prevents the too great porosity of the soil, and thus prevents them from drying so soon; it also retains the manuring matters applied to the soil, and thus prevents them from evaporating into the air. Clay has also another very valuable property—that is, of abstracting gaseous substances from the atmosphere. If you breathe on a piece of clay, a smell is given off, which is due to the clay absorbing the moisture given off during breathing, and this expels some of the gases contained in it.

NOTES OF AN AGRICULTURAL TOUR IN IRELAND.—BY MARTIN DOYLE.

(*Concluded from page 327*).

THOUGH it is in some degree anticipating the regular order of my little tour to refer here to the county of Wexford, I must say—in illustration of the anti-emigration tendency that well-managed small farms on which mixed husbandry is pursued are likely to produce—that the two districts of the county of Wexford known as the baronies of Forth and Bargy (the former of these more especially) have suffered less from famine and its results, and have sent out fewer emigrants than, I believe, any other equally populous parts of Ireland. An industrious system of neat and judicious culture (relatively with the ordinary Irish agriculture), embracing various crops, and the breeding and rearing of cattle, pigs, and poultry, in great numbers, considering the usual smallness of the farms, has enabled both landlords and tenants there to sustain their wonted energies and independence, though poor-rates have been heavy and rents high. Their position, however, on and near the sea-coast, with an excellent soil and facilities of manuring, give them advantages which the emigrating sections from the inland parts of the south and the west have not possessed. Besides, there are some ethnological considerations to be taken into account along with the mere physical points of soil and climate and proximity to a thriving town; the people have inherently an industrious, thrifty disposition, and orderly habits indicating self-respect and steadiness of character, with proverbial honesty. They originally immigrated in the 12th century from Wales, with the Earl of Pembroke, but not from a Celtic stock; they do not speak the Celtic tongue, nor understand a word of it; they have none of the indolence and carelessness and impulsiveness of the native peasant of Connaught or Munster, though they have some of his best qualities. Being good farmers for their circumstances and opportunities, and steady labourers, the emigration of such valuable subjects is to be deprecated; and happily few of them have occasion to leave Ireland.

But to return to Kilmallock. Part of the "golden vale," a tract of rich mellow loam, is in this locality. It is of course, then, a great Wheat district, and Potatoes used to flourish there. Here, indeed, an English farmer might venture to purchase an estate—if he could get it. It is not a little curious that Mr. Wakefield, who published his agricultural book in 1812, rated, from the most accurate inquiries, the maximum produce of Barley in Limerick at 4480 lbs. per statute acre; and of Potatoes, on soil of the same quality, I believe, in Meath, at the enormous quantity of 72,100 lbs. per acre; whereas Professor Low estimates the weight of Barley (average, however) at 1872 lbs. and of Potatoes at 17,920 lbs. for Great Britain. Mr. Low has not stated the maximum weight in these cases, but Professor Johnson does; he calculates the maximum weight of Barley in Great Britain at 4160 lbs. and of Potatoes at 67,200 lbs. The following remark of Sir Robert Kane on the foregoing produce is worth transcribing. "The mode of farming in Ireland was, in 1812, such as made it a matter of wonder that any crop at all should be obtained. It must therefore be concluded that the naturally high fertility of the soil compensated for the ignorance of the farmer, and brought the final result of Ireland in 1812, and Great Britain in 1843, to the equality of production which has been just illustrated."

Great numbers of cattle are bred and fattened in neighbouring pasture lands—mountain and plain—and altogether this district seems pre-eminently desirable to a farmer. With such soil then, and the capabilities of cultivating every sort of crop, including Flax, which grows here luxuriantly, what are the deficiencies which strike the Englishman at the first glance? He sees by far too many fields, an irregular one frequently, minute subdivisions, and a slovenly style of farming. With exceptional cases, showing that the farms have been generally in the hands of ignorant and exhausting cultivators, he compares, as he travels still onwards through the hedgeless country by Buttevant, this unembellished tract of open land with extensive undulating downs (of calcareous soil also) as in Hampshire or Berkshire, for example. His imagination reverts to the tracts around Ilsley and such districts, where, though there is bleakness, nothing offends the eye; on the contrary, farmhouses and labourers' cottages of a compact and comfortable description, at suitable and economical intervals are there indicative of a perfect system and of prosperity. There are no dilapidated walls, straggling hovels, or mean inclosures, with piebald cultivation. He sees open divisions of land under regular rotations. One portion, it may be of 100 acres, under luxuriant Wheat, carefully hand-hoed; a second, of Beans or Turnips; a third, of Barley; and a fourth, of Clover, with a continuous portion of pasture land, to take its turn of cultivation at some future day. He does not see a heap of waste land, and hardly a fence, except about the homesteads for shelter and embellishment, because there are no trespassing cattle and promenading pigs to guard against. How different about Buttevant!

Now, though hedgerows are ornamental, and generally desirable on other accounts also, in a populous land, the absence of them is better than the existence of those miserable substitutes which deform so large an area of Ireland. With respect to the fertile calcareous district about Kilmallock, an English farmer, accustomed to the working of the strong loams on a chalk subsoil, in Hants or Berks, with powerful teams and high manuring, would find the culture of the more friable and fertile loams of Ireland mere child's play in comparison, and the yield enormous. What, then, would the experienced and industrious English farmer find necessary to be done on such land as I have been describing?

Home Correspondence.

Lois-Weedon Wheat Growing.—For the information of very many applicants, most of whom, I believe, are readers of the *Agricultural Gazette*, I think it right to make public the following report of my last year's crop of Wheat, which is just threshed out. "The year 1853 will long be remembered as, perhaps, one of the worst years for Wheat, in respect to yield, ever known. Where one good farmer looked for five quarters per acre, he reaped only three; where another felt assured of four, he found it dwindle to two." Thus I wrote in November last; adding that in my own case the estimated produce was 40 bushels. This estimate was, I think, general, though not universal; for, there was one inspector with a keener eye and larger experience than my own, who warned me in my incredulity that, fine as the crop was in appearance, I should see by the scale and the bushel that the season had told on the produce and lowered it 20 per cent. He was under the mark. *The yield is scarcely 26 bushels. S. Smith, Vicarage, Lois-Weedon, June 28.*

Thin Seeding.—I wish to ask "J. B.," who has written such an excellent account of my friend Mr. Mechi's farming, but who disapproves of what he calls Mr. Mechi's too thin seeding, whether he himself has ever fairly tried half a bushel of seed Wheat or of seed Barley against twice as much, three times as much, or four or five or six times as much. If he has not, I should also wish to ask him what he would think of one peck of Wheat or even of half a peck, or of one or two pecks of Barley only. Of course, if "J. B." condemns Mr. Mechi's four or five pecks of seed Wheat, he would more than condemn my two pecks or one peck, and especially my half peck, and my two pecks of Barley; and yet I produced on the same field, on an average of four years in succession, 5½ qrs. of Wheat, and my quantity of seed never exceeded two pecks, but I varied it from half a peck to two pecks; and what will, I have no doubt, astonish "J. B.," and perhaps nine-tenths of farmers besides, still more—my crops from the half peck and the one peck of seed Wheat per acre were better than those from the two pecks. Let it always be understood also that I always sold my Wheat at the very highest market price; and as for my Barley, the lowest crop I ever had was 4½ qrs. per acre, and the highest 8 qrs. within one bushel; and these crops I sold every year, except one, for seed; and that one, which was last year, the Barley grew in the same field which had been Wheat four successive times before; I sold it at a declining market, at 44*s.* a quarter. Nay, I go still further; I am now cutting a crop of Clover in the same field, which for weight and quality I will back against any crop in England, however it may have been produced; and I intend to mow it again, and then I will drill the field with Wheat, with the drill I use and invented myself, and which deposits just as many seeds as I wish and no more; and the highest quantity of seed I will drill shall be two pecks, and the lowest quantity half a peck; and I will even now back the produce next year against any one bushel, two bushel, or three bushel seeder in the kingdom. Why, then, should I use more seed? Will any gentleman point out to me why I should throw into my land 64 or even 96 quarts of seed per acre, when I can produce, as I have done, nearly 7 quarters of fine Wheat, and nearly 8 quarters of fine Barley, from quantities of seed ranging from 4 to 16 quarts an acre only? And I do still more; for while the thick seeders exhaust their soils with every crop they produce, rendering their operations a continual series of exhaustings and repletions, my land always improves under my system, from its never being impoverished. But, according to my friend Mr. Mechi's showing, he himself puts into the ground from 12 to 15 grains of Wheat to every square foot, and of this quantity "J. B." complains that it is too small; whereas, for some parts of the crops I have referred to I used only one-eighth or one-tenth as much, and for none of them did I use more than one-fifth or one-sixth; and let it be borne in mind always that I produce crop of Wheat after crop as long as I please, and then Barley; and now this year, as I have stated, I will back my Clover, for quantity and quality, against any crop in England; and "J. B.," if he will take the trouble, shall be the judge. But perhaps I shall be told, as I often have been, that this is garden cultivation; and if so, so much in commendation of it; but no such thing, I cultivate with the plough, roller, harrows, scarifier, and horse-hoe alone; and, as I have stated, I put my seed in with a two-horse drill, invented and made by myself, and with which I can put in half a pint of seed with as much regularity as I can two pecks, or a bushel or more. Where, then, I may perhaps be asked, is the secret? And if so, I answer—in deep and thorough draining, the best ploughing I can give, never exhausting, and the feeding of my crops with such food as is proper for them. *Geo. Wilkins.*

Cottage Economy.—As you seem anxious to assist the labouring classes in acquiring habits of economy in preparing and varying their food, and so adding to their comfort, I enclose a few receipts of Scotch dishes which are especial favourites all over Scotland, and are to be seen on the tables of both rich and poor. If you can persuade your countrymen to give them a trial, you will do them a service by enabling them to feed their families much better and at less expense than they do at present. Stews, in general, are liked in Scotland, the sauce making the vegetable (of which we are fond) more palatable. But the Barley broth is the staple food; it requires but little fire in making, and may be said almost to cook itself. I may, if you approve, send some more receipts some time after this.

Barley Broth.—Take of beef or mutton, as is most convenient, about 3 lbs.; put the meat in cold water, in the proportion of 4 quarts to the 3 lbs. of meat, and a teacupful of Barley. Be careful the pot and cover are clean. A little before it comes to the boil, skim it well, and wipe the inside of the cover, then draw aside the pot, and let the broth boil gently for an hour, at which

time put to it two young Carrots and Turnips, cut in dices, two or three Onions sliced, and a little salt; let it boil till the roots are done, and the broth is rich and good. A quarter of an hour before the broth is ready, add a little Parsley, picked and chopped. For beef broth a small quantity of Cabbage or German Greens, roughly shred, to four or five leeks, cut in two-inch lengths, is a good variety. If there is danger of the meat being overdone before the broth is properly *lithed* or thickened, it may be taken up, covered for half an hour, and returned to the pot to heat before it is dished. The pieces of beef best adapted for Barley broth are the shin, the brisket, the flank, and the veiny piece of mutton, the neck, the shoulder, and the leg. The brisket or flank when salted for a week makes excellent broth, and the meat eats better.

Pea Soup may be made of the bones of meat used for pies, trimmings of meat, roast-meat bones, or even dripping. Put any of the above in a pot with 3 quarts of cold water; let them come to the boil; skim, and add three teacupfuls of split Peas, and two or three Onions, and a grated Carrot and a little salt. Let them boil till the Peas are dissolved, then cut down a little toasted bread, throw that into the tureen, and pour the soup over it; add a little pepper and mustard. The bones to be taken out before being dished.

Potato Soup.—This cheap and generally acceptable soup may be made of the same materials as Pea soup, or of any liquor in which meat has been boiled; pare as many Potatoes as you think will be required to make the soup of a proper thickness or mash. Season with Onions, pepper, and salt.

Minced Collops.—Mince a fleshy piece of beef, free of skin and gristle, very fine. Roll the collops into a ball, and dust a little flour over it; then brown them with a little suet in a saucepan; some add an Onion, sliced. Add a little water to them, beating them with an iron or wooden spoon, to keep them from going to lumps. Season with pepper and salt. Cover the pan close, and let them stew till tender.

M. C. J., Morningside, Edinburgh.

Gypsum and Superphosphate. — The following two letters, written for our local papers, being of general and seasonable interest, I send copies of them for your columns. *J. Prideaux.*

(1). "Having seen some cargoes of gypsum which I was informed were for the purpose of adulterating superphosphate of lime, I advise farmers and other purchasers of phosphates of lime, of all kinds, and under whatever name, to demand a written engagement on the invoice that they are genuine, and not adulterated with gypsum or any other substance. And the same with guano, which I have reason to believe is subject to the like fraud."

(2). "My caution was not against containing gypsum, but against being adulterated with it. That gypsum is produced in the manufacture of superphosphate manure is well known, and is the reverse of a reason for its further addition. The gypsum produced is no adulteration, the gypsum superadded is one; and it was not candid, towards the farmer, to confound one with the other. Manure dealers know, also, or should know, and farmers too, that burning away the animal matter of bones, and then making up the weight with gypsum, is injurious to the manure, and that the addition of gypsum to keep down the price is unfair to the upright competitor. It will be desirable for purchasers to claim, not only a pledge against adulteration, but a warrant of analysis, subject to the decision of Professor Way (on an agreed fair sample), for guano as well as superphosphate; and that farmers' clubs should form mutual protection societies against frauds in manure. The quantity of guano sold last year was probably three times more than was imported. And when we see cargoes of gypsum, brought in expressly for the adulteration of superphosphate, who shall say how far it may be carried?"

Gorse or Furze.—On the notice of this shrub in a late *Gazette*, it would appear from the quantity raised per acre to be a very valuable article for horses and cattle, as a substitute for hay, and it would be most desirable that it should be more extensively known than it seems to be; perhaps your correspondents would be good enough to give a more particular account as to its cultivation, stating the proper time and mode of sowing the seeds, and of their arriving at maturity, the process of securing the crop and manner in which the same should be given to animals, as also the course of cropping the land and duration of the crop, and of its renewal, and whether it be of an exhausting nature, and any other particulars that might occur to them to be necessary for a full knowledge of its general utility. *Inquirer.*

[On these points we extract the following from the article on Gorse, in Blackie's "Cyclopedia of Agriculture:"—

The best sort to cultivate is Ulex strictus, so called, which is, however, thought to be merely a variety of the common Whin. It is more herbaceous than the U. Europæus, though of smaller and slower growth—but it cannot be grown from seed. If it be selected, cuttings must be struck or layers obtained, and these must be transplanted into the field on which it is to be grown. The more common plan, however, is to sow the seed of U. Europæus. About 10 lbs. of seed may be sown per acre, in shallow rows, of any light soil, in the month of March; the rows may be 10 inches apart, and the best plan is to sow it just as Wheat is sown in some districts:—The men opening a shallow drill with a broad light hoe, sowing the seed along it, and then covering it with the earth taken in opening the next drill. It can thus be sown for about 6*s.* an acre; and if 8 or 10 lbs. of seed, at 1*s.* a lb. be used, the first cost of the crop is not very great. Some people, however, recommend a larger quantity, and sow it broadcast; this is not a good plan, for the only difficulty which the crop has to withstand arises from the obstruction of its early growth by means of weeds, and these can, of course, be much more easily extirpated under a drill husbandry of the crop. In the second autumn after sowing, having been cleaned at intervals during both the summers, the crop will have attained a growth rendering it worth cutting; but it is well to cut only every alternate row this time, leaving every other to attain a two and a half years' growth against the following autumn; and, by pursuing this method, the half of the field is each year harvested when two years old, having had the advantage of ample room for development, during the second year of its growth, by the removal of the alternate rows. It is cut with a short and heavy hook, within a few inches of the ground, and tied up in bundles. This is paid for at the rate of about 5*d.* per score of bundles, each weighing about 20 lbs. Two thousand faggots may be the average produce of one acre. This, on being brought home in daily or weekly portions, is cut up somewhat by hand, the stems and very woody portions being thrown away, and the remainder crushed for use. A mallet and block is the simplest apparatus for the purpose. The Gorse being laid on the block, is first cut to bits with the one end of the mallet, armed with cross knife edges, and then smashed with the other end, before being given to cows or horses. But many more efficient and less laborious methods exist, in which this manual operation is replaced by a mechanical contrivance.]

Economic Manure.—I beg you to publish the enclosed paragraph, cut out of Dr. Voelcker's article on "Saline Manure," in Blackie's "Cyclopedia of Agriculture." It ought to be placed alongside of the advertisements which have recently appeared in your columns. *M.*

"As many saline compound manures are very efficacious, and as, generally speaking, farmers are satisfied with the effects they produce, and do not inquire if they might not purchase, in a cheaper market, at half the cost price, the same materials, we can explain how it is that in many instances artificial manures, especially compound saline manures, find purchasers, although the manufacturer takes twice as great a profit as he is entitled to. Practical examples, it is said, teach better than the best arguments; and for this reason we would direct attention to a saline manure, which has lately been offered for sale under the name of 'economic manure.' In the advertisement, this manure is described as highly economic, and possessing superior fertilising effects to the best Peruvian guano. The following analytical results, which the writer of this article obtained on analyses, indeed convinced him that the manure was fully entitled to the epithet *economic;* not, however, on account of its intrinsic value to the purchaser, but on account of the strict rules of economy which have guided the manufacturer in compounding it. The manure contained in 100 parts the following constituents:—

Economic(?) Manure.

Water	36·525
Proto-sulphate of iron (green vitriol)	23·756
Sulphate of lime (gypsum)	·860
Sulphate of magnesia (Epsom salts)	·204
Bisulphate of potash	4·677
Bisulphate of soda	10·928
Sulphate of soda (Glauber salts)	15·143
Sulphate of ammonia	2·648
Insoluble silicious matter (chiefly sand)	8·850
	100·591

It will be observed, that the manure consists principally of green vitriol and sulphate of soda, or Glauber salts, two equally cheap salts, and contains no less than 36½ per cent. of water, 5·8 per cent. of sand, or together 42 per cent. of valueless matters. The fertilising effects of green vitriol appear to be of no high order; and the really expensive and efficacious fertilising salts, namely, sulphate of ammonia and potash, have been added to this mixed saline manure but very sparingly. Nevertheless, we do not doubt that the application of this manure on some land may be followed with beneficial results; but, even taking for granted that it is very efficacious, we still feel bound to censure both the manufacturers and purchasers, the first for selling, and the second for buying a manure, which ought to be supplied at about 5*l.*, and not at the price of 12*l.* per ton. We have made a careful calculation, from which it appears that any farmer may obtain the salts which enter into the composition of a ton of this manure at about 4*l.*, exactly one-third of the price at which this economic manure is sold."

We add, from the *Journal of the Irish Agricultural Society*, Professor Apjohn's analysis of the same manure:

32, Lower Baggot Street, March 27, 1854.

DEAR SIR,—Underneath you have the exact composition of "the British Economical Manure," which a member of our Society requested you to have analysed.

Sand	1·76	
Peroxide of iron	1·08	Insoluble in Water.
Phosphoric acid	·30	
Lime	·27	
Gypsum	20·57	
Sulphate of Magnesia	·33	
Chloride of sodium	12·76	
Sulphate of soda (anhydrous)	22·26	
Sulphate of potash	·67	
Sulphate of iron (in crystal)	38·65	
Sulphate of ammonia	1·35	
	100·00	

The amount of saline ammonia which is set down in the analysis as sulphate, was found to be ·337 per cent., and upon burning the substance with soda lime, it came out ·350; these numbers being very nearly the same, it may be inferred that no azotised organic matter was present capable of yielding ammonia as the result of its decomposition. I should not omit to mention that, when this mixture is treated with an acid, a very feeble effervescence at one or two detached points was sometimes visible, but in some experiments made with care, for the purpose of estimating the carbonic acid, the utmost which was obtained was half a grain from 100. In looking over the above results, Mr. Wight will perceive that the subject of the analysis is a purely saline manure, destitute of azotised organic matter, and containing but very minute quantities of ammonia and phosphoric acid. The most valuable salt present in tolerable quantity is its sulphate of soda, next to which comes the gypsum, and then the chloride of sodium or common salt. As to the green vitriol which constitutes 38·65 per cent. of the mixture, it is difficult to understand why it should have been employed at all, as the prevailing opinion of agriculturists and chemists is that the salts of iron soluble in water are injurious to vegetation. The salt in question, as is well known, abounds in peaty soils, and with a view to the bringing of such into cultivation, the addition of lime for the purpose of decomposing the salt of iron is generally considered indispensable. The success of the practice, however, certainly shows that green vitriol may be added without injury to soils abounding in calcareous matter, and it is even possible that its application in such cases may be productive of benefit, as the green vitriol will, of necessity, be converted into gypsum. Conducting the calculation in the manner usually adopted, and assuming that the green vitriol is replaced by its equivalent of gypsum, the supposition most favourable to the vendor, I find that "the British Economical Manure" is worth 3*l.* 8*s.* 6½*d.* per ton. It may be worth this sum as an application to a calcareous clay, but as I have already explained, it would probably be injurious to soils totally destitute of lime.

I am, dear sir, faithfully yours,

JAMES APJOHN.

N.B.—In estimating this manure as worth 3*l.* 8*s.* 6½*d.* per ton, I have assumed, on the authority of Professor Johnson, that sulphate of soda is worth 10*s.* per cwt. Since then, however, I have ascertained that *salt ash* may be had in this city for 4*s.* 6*d.* per cwt.; so that it will be necessary to subtract 19*s.* 10*d.* from the money value already given, which will leave the "British Economical Manure" worth only 2*l.* 8*s.* 8½*d.* per ton. J. A.

The following is a third analysis, with which we have been favoured by Mr. Nesbit:—

Analysis of sample of "Economic Manure."

	Per cent.
Moisture	18.05
Silica	3.50
Sulphate of iron	36.15
Chloride of sodium	20.19
Sulphate of soda, &c.	22.11
	100.00
Nitrogen (equal to)	.49
Ammonia	.60

J. C. Nesbit, College of Chemistry, Agriculture, &c., 38 and 39, Lower Kennington Lane, London.

Societies.

ROYAL AGRICULTURAL SOCIETY.

WEEKLY COUNCIL, *June* 28.—Colonel CHALLONER Trustee, in the Chair.

EARLY TARES.—The Rev. A. Huxtable transmitted a specimen of early Tares grown upon his Hill Farm in Dorsetshire, at an elevation of 600 feet above the level of the sea. The seeds furnished to him by Mr. W. H. Davis, of Marnhall, near Blandford, were sown at the end of the first week in October, and the plants were at least one month in advance of other "early" Vetches sown several days before them. The maturity of these Tares in growth and podding was in Mr. Huxtable's experience unrivalled; for, notwithstanding the severe frosts of the past April, they were in full bloom in the first week of May; and he thought it unnecessary to point out the importance of a crop which would be available for sheep feeding in the early spring.—Prof. Way remarked, that great quantities of rain fell upon the high lands in Mr. Huxtable's district, and the atmosphere there was mild but damp.—Mr. Baskerville Glegg stated that in Cheshire the farmers had generally their crop of Tares by the middle of May.

APRIL WHEAT.—Mr. Iltid Thomas, of Hill House, Swansea, favoured the Council with his experience of the cultivation of April Wheat in South Wales. He preferred it to all other varieties. He had sowed it this year on the 3d of May, and in 28 days it had grown to the height of 6 or 7 inches. The land was a miserable bottomless gravel in the coal-basin, very much exposed to every wind, at an elevation of some 500 feet above the level of the sea, where the vegetation was severely tried by the action of the copper and patent fuel smoke of that locality. The grain was strongly retained by the straw, and the Wheat therefore stood wind well. It was sown last year on the 25th April, and on account of the unfavourable nature of the season, he had a very light crop of it, otherwise it would have yielded from 32 to 35 bushels per acre. He sold the produce at 9*s.* per bushel, and for seed at 10*s.* He had found Clover to succeed very well with it. He did not think it more exhausting than Barley; it was sown at the same time as Barley, with a similar yield of crop, and fetched double the price in the market. The bread made from it was brown, but very sweet and agreeable. This April Wheat was a bearded one, and he highly recommended it for soils not good enough for other higher-bred varieties.—Sir Matthew Ridley referred to the objection offered by the millers in the north of England against the April Wheat, on account of its coarseness and thick skin. It was sown in April and yielded well, but it did not obtain a good price in the market.—Colonel Challoner stated his successful cultivation of the Talavera Wheat, which he sowed very early in the year, and found it escape the ordinary ravages to which the Wheat crop was liable.—Mr. Dent, M.P., alluded to the excellent crops of April Wheat grown by Mr. Thompson, of Moat Hall, in Yorkshire. His was a bearded Wheat, and was sown at the latter end of April.

MANURES.—Mr. Andrews, of Cornwall, transmitted a statement and sample connected with his preparation of a manure which he considered highly fertilising, and at the same time very cheap.—Mr. Martin, of Elgin, communicated suggestions for the collection of manure from marine animals, to be obtained at fishing villages, by dredging, and by the employment of women and children in collecting the refuse of fishing-boats.

RICK-MACHINE.—Mr. Lawes submitted the model of a machine he had found very useful in raising hay and corn to the tops of stacks, and for feeding the threshing-machines with sheaves. It was similar in its form and mounting to the common fire-escape; but having attached, at intervals, to an endless-revolving web, the rake-work which carried up aloft the hay or corn required to be stacked.—Colonel Challoner explained to the Council the very complete arrangements for effecting similar objects he had recently been invited to inspect at Prince Albert's Farm at Osborne.

STEAM CULTIVATION.—Mr. Murphy, of Cork, communicated to the Council a statement of peculiarities in the construction of his single and double-action spade-cylinder machine for cutting, turning up, and pulverising the soil 10 inches deep by the draught of a single horse.

GLASS MILK-PANS.—Prof. H. von Blücher, of Wasdow, near Rostock (on application to him through the intervention of M. Kreept, the Mecklenburg Consul-General, in London, and at the suggestion of Mr. George Raymond Barker), favoured the Council with the following information connected with the original black-glass milk-pans of the Pine forests of North Germany, recommended to the Society by its late distinguished foreign member, Capt. Stanley Carr, whose recent loss the members have deeply to regret:—

There are only few manufactories of glass in Mecklenburg; in regard to the black-glass milk-pans, the best are fabricated by Mr. Cleve at Karow, by Plau in Mecklenburg, and the surest and cheapest way to procure them would be to apply to the merchant, Joh Christ. Voigt at Rostock, who deals in that article, has at present about 3000 in store, and will send them direct from Rostock to London. The price for 100 pieces (extra embellage) is 27 Prussian dollars; the weight of each is 6—7 lbs. (Hamburgh), and the diameter about 17 inches (English).

Colonel Challoner referred to the great improvement he had effected in his dairy by raising it, as Captain Stanley Carr had recommended, for the purpose of promoting ventilation. This alteration of from 4 to 6 feet greater height had proved of incalculable value; it had cost him 25*l.* to effect it; but he would not for four times that sum restore his dairy to its former proportions.

IMPROVEMENT IN HORSE BREEDING.—Mr. Spooner, of Southampton, recommended the Council to take measures, with the Government, as well as with the local societies of the country, for improving the breed of horses for cavalry and artillery purposes, with the view of obtaining animals possessing a combination of activity and strength in the highest degree. He thought this object would be obtained by encouraging the breeding of good saddle-horses from the best brood mares capable of carrying 16 stones, by the best stallions, well but not thorough-bred, capable

of carrying a similar weight. He thought that such mares abounded throughout the country, although they were at present employed for draught and other laborious purposes; he considered that the class of male horses to be used, was the one now too frequently castrated, namely, a three part bred hunter, capable of carrying a heavy weight up to the fleetest hounds; such an animal readily commands some 200*l.* or 300*l.* when his excellences are known, and it may in fact be regarded as the most noble and valuable of the horse tribe. Mr. Spooner had little doubt that the system would, in a few years, result in the degeneration of the English breed of saddle horses.—Sir Matthew Ridley referred to the Government establishment in foreign countries of haras, for the express purpose of effecting improvements in the breed of horses. In the north of England good size, and absence of white colour, were points to which much attention was paid. Reference was made to the extensive agency at work in this country for the purchase of the best English horses for exportation to the continent, and to the constant advocacy, by that distinguished veteran Sir Harry Smith, of improvements in our breed of horses for military purposes, by a restoration of the best qualities of the old English hunter.

Deodara Pine.—Sir Matthew Ridley referred to the secure manner in which Deodara Pine seeds had reached him from India, and had retained all their freshness and vitality, by being enclosed in thin oiled canvas; and to the success with which trees of that Pine, 10 years old, had been transplanted from Northumberland to Warwickshire, where they were at that time growing most luxuriantly.

Hamster.—Dr. Calvert stated that rat-like animals of a large size, supposed to bear some affinity to the hamster, were effecting much damage in Yorkshire and also in Hertfordshire.

Mr. Chadwick, C.B., presented the last report of the Board of Health on sanitary measures connected with agricultural operations; and Mr. Rogerson, of St. Alban's Villa, Highgate-Rise, copies of Essays on the agricultural value of the Weardale Lime.

Adjourned to July 5.

Poultry.

Poultry.—I am a farmer, and of course have heard a great deal during this last two or three years about the wonderful value of poultry, &c.; but I shall feel much obliged if any of your correspondents will inform me how I am to make it assist in paying the rent of my farm. I want it to be to the farmer what it is to the fancier, viz., an important item; not that I desire such prices, I will be content if I can obtain 3*s.* per couple for my chickens, and from 9*d.* to 1*s.* per dozen for eggs. That is not being too covetous—is it? The principal questions to which I require answers are, I suppose, what breed must I keep (with, of course, a few hints as to the requisite management), how are eggs to be preserved, and if cross breeds are approved of? If any of your correspondents will take compassion on my ignorance, and endeavour to enlighten me, I must beg him to remember that it is the farmer and not the fancier who now seeks information. *Main Chance.*

Poultry: *A Constant Reader.* No fault can be found with your method of feeding the chickens; there are complaints, similar to yours, from all parts; but the disease is not confined to Silver pencilled Hamburghs—in fact, we have been more successful with this sort than with any other variety. We can only recommend change of food, and frequent change of situation for your fowls; nothing else can be done for them.—*Charles Lyndon.* If you do not regard expense, and are anxious to get a great deal of information respecting poultry houses, &c., we advise you to get "The Poultry Book," in which you will find most copious remarks—in fact, we consider that the chief fault of the book is its dwelling too much on one point. But if you wish *multum in parvo*, and a work that gives the desired information (on feeding and rearing poultry, as well as many useful instructions for building poultry houses) in very few words, and which can, moreover, be obtained for little money, then we strongly advise you to get "Fowls," by Baily. We shall be happy to communicate with you again, if you do not find satisfactory information in the books we have mentioned.

Miscellaneous.

The Hop Blight.—"As soon as the aphides settle upon the Hops, they suck the under side of the leaves, and immediately deposit their young—the aphis louse. The lice, too, are viviparous, and they have the singular faculty of propagating their species within a few hours after their birth; and in this manner many generations are produced without the intervention of the fully formed aphis fly; indeed, upon one hill of Hops millions of lice are born and die, neither parents nor progeny having ever attained the condition of the perfect insect. When the first attack of these flies upon the Hops is severe, and early in the season, the growth of the plant is commonly stopped in the course of three or four weeks. If the attack be late—that is, about midsummer, or afterwards—the bine has then attained so much strength that it struggles on against the blight to its disadvantage, and the result is a total failure of the crop at last; for the leaves fall off, and the fruit branches being already formed, there is no chance of recovery. At this time, and in this condition, the stench from the Hop plantations is most offensive. In an early blight, however, we have many instances recorded of extraordinary recoveries; for these insects are remarkably susceptible of atmospherical and electrical changes, and on a sudden alteration of the weather we have known them perish by myriads in a night. This was specially exemplified in the Farnham district, about the middle of June, 1846, which suddenly recovered from a most severe attack, and afterwards produced the *largest crop* ever grown in that quarter. The condition of the plant, therefore, is never hopeless, however severe the attack may be, provided there is *time* for it to put forth its lateral or fructifying branches. We know also several instances in East Kent, which occurred in the same year, when the planters sold their growths on the poles at a few shillings per acre, and these same plantations so far recovered that many of them afterwards produced a crop worth from 30*l.* to 50*l.* per acre. The progress and usual termination of the aphis blight may be thus described. The flies, as before remarked, on their first arrival, immediately suck the under side of the upper small leaves of the bine, and thus they there deposit their young upon the most succulent part of the plant. The multiplication of the lice is so rapid, that the leaves become so thickly covered as scarcely to allow a pin to be thrust between them. They quickly abstract the juices of the bine, so that the leaves assume a sickly brown hue, and curl up, and the bine itself ceases to grow, and falls from the pole, the lice continuing till they perish for want of food; and thus, without the intervention of a favourable change, the crop is destroyed, and the grower may often consider himself fortunate if the plant recovers a due amount of vitality to produce a crop in the following year, for occasionally the hills are killed by the severity of the attack. This description, of course, applies only to the most severe and unusual blights."

Improvements in Cutting Roots and other Vegetable Substances. By R. Barter, M.D., Saint Ann's Hill, Blarney, Cork. Patent dated March 7, 1853. (No. 562.)—The machine described by Mr. Barter consists of a circular disc or drum, or two discs united by cross pieces with a drum or driving wheel between them, suitably mounted in a frame and having an operating surface of suitably-formed knives or cutters on each side of the said disc, or on the outer sides of the pair of discs. The discs are placed between two hoppers, and made to revolve. The inventor claims the above arrangement of apparatus. *Mechanics' Magazine.*

Calendar of Operations.

JUNE.

Farm near Chelmsford, *June* 29.—We are proceeding with our Clover and Grass crops; the former we have secured, the latter are proceeding well under rather unfavourable weather; for although but little rain has fallen on the aggregate, still, from the 23d, we have had occasional showers that greatly interfere with our hay-making proceedings. The crops are unusually light, the best Clover will not average a ton, and the Grass far below that quantity per acre; nor is there great prospect of the aftermath, as the soil is unusually dry, less rain having fallen from October last than we ever recollect in any antecedent year; February, March, April, and greater part of May having been dry, with a drying air and much sunshine; but the latter part of May and June cold cloudy weather, and up to the longest day not one warm congenial summer's day had fallen to our lot, and from Sunday last we have experienced a low temperature. Upon the whole, however, we think that the cool weather has been beneficial to the crops of Wheat, Barley, and Oats. The former has greatly improved, and has assumed a more lively colour; the ear, too, is fine, and generally throughout this district we have observed a similar degree of improvement; the plant is, however, generally thin, but upon good soils has tillered well. Upon one piece we examined yesterday we found upwards of 30 stems from a single grain, and these were not exceptions, as the average of some score or more that we counted nearly reached 18. This was upon Clover lea in good condition, but in February last not thought worth standing for a crop. Some of the stems of Wheat were covered near the roots with some substance of the appearance of white mould. This, upon examination, proved to be a fungus, but it has now entirely disappeared. Little of the Wheat midge has been observed this season; indeed, not one has been seen upon this farm—a most unusual occurrence—as for many years past myriads have been observed at the season of the Wheat coming into ear. We hardly think the average of the county will be above a medium crop; in this immediate vicinity, however, it will be above, so far as appearances justify our observation. For ourselves we say our crop was never more promising, not only as regards Wheat but also of Barley and Oats, and we believe that such is the case upon all the light mixed soils in this county; upon cold clay subsoils, that are not properly drained, it is otherwise; the cold, weather that attended the rain in May checked vegetation, and some of the Barley is turned yellow, and will be a light crop. Our Mangold Wurzel has greatly improved; the plant, however, is about one-fourth deficient. It is all hoed and singled, and if hot weather follows will grow rapidly. Our Swedes are not full in plant; wherever we drilled them with a little superphosphate and ashes they are not affected with fly, but wherever that was omitted the flies have swept them off. Guano is destructive to the seed, if the latter is drilled immediately in contact; we, therefore, sow 3 cwt. to the acre, which is ploughed in, and the seed then drilled with 1 cwt. of superphosphate of lime mixed with double its bulk of wood-ashes; the plant in all such cases is unusually free from attack by fly, but upon those acres first drilled without the superphosphate the flies have swept them all off. Upon another field drilled with Mangold Wurzel in the same way, it may be distinguished as far distant as half a mile how far the extra quantity of superphosphate was drilled in with the seed. All our land for white Turnips is prepared, and we wait until the 10th of July for sowing them. Upon the whole the excellent condition of the fallows leads us to expect an abundant crop of roots for winter use.

Notices to Correspondents.

Bath and West of England Society: *M.* In our report of the prizes awarded for implements at this meeting we omitted to state that a prize of 2*l.* was awarded to the drill invented by Mr. Spooner and exhibited by Messrs. Tasker and Fowle. The Secretary, H. St. John Maule, Esq., in reply to a letter on the subject, says (June 20), "I am quite unable to account for the omission of the water-drill made by the reporters. It is duly entered in my award book, which book was open to such of the reporters as were present. It certainly is a most admirable implement, and ought to be noticed."

Diseases: *A. Simpson.* It is the common rust, *Uredo Rubigo vera.* It is seldom injurious except it attacks the ear, which does not seem to be the case in your specimens. You are quite right about the dark green here being indication of rust and mildew. *M. J. B.*

Foal: *A H F C.* The disease was pleurisy, for which bleeding in the early stage, and blistering the sides of the chest, with sedative medicines (but no purgatives), internally administered, are suitable remedies. The cause was probably a cold or chill, but it was not necessarily epidemic." *W. C. S.*

SCYTHES.

BOYD'S PATENT SELF-ADJUSTING SCYTHE will last out three of the ordinary sort, and is always ready for use.

"We have seen this Scythe at work, and can strongly recommend it."—See *Mark Lane Express*, May 16, 1853.

To be had of every Ironmonger and Nurseryman in the kingdom; and wholesale and retail of WM. DRAY and CO., Agricultural Implement Makers, Swan Lane, London.

DRUMMOND'S REAPING SCYTHES.—Farmers and others intending to use this excellent Corn Scythe during the coming harvest, will please supply themselves without delay, and thereby prevent the disappointment that was experienced last year, through the inability of the Subscribers to overtake the execution of orders received late in the season.

Price of a single Scythe	... ...	11*s.*	6*d.*
Ditto of three, package included...	... ...	32	6
Ditto of six, ditto ditto	... ...	60	0

Carriage paid to London, Liverpool, Hull, Birmingham, &c.

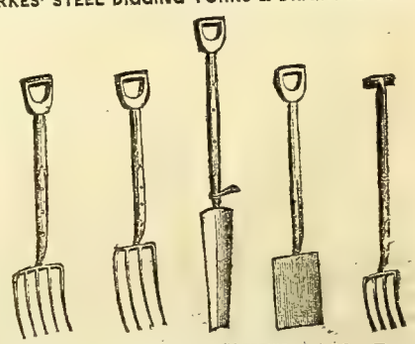
W. Drummond & Son, Seed and Implement Warehouse, Stirling, N.B.

☞ Orders from unknown correspondents must be accompanied with a remittance, otherwise they cannot be attended to.

BUDDING'S LAWN MOWERS, with Samuelson's registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. Burgess & Key, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS



MESSRS. BURGESS and KEY, as Mr. Parkes. Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

STEPHENSON and PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. Archer, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

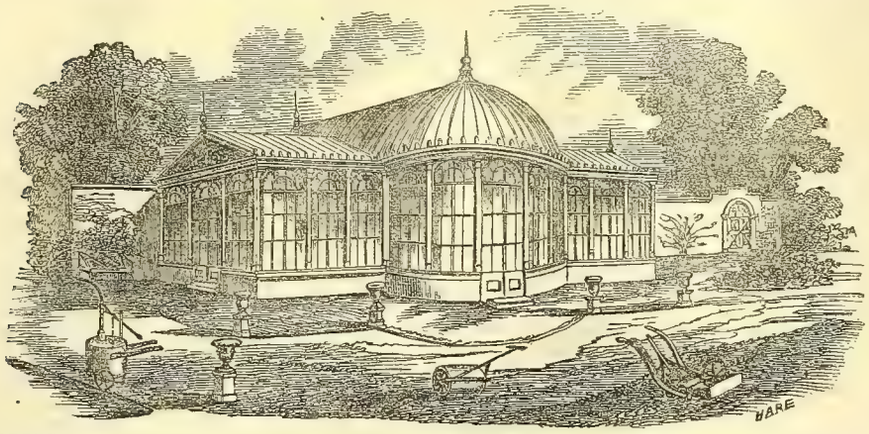
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement J. B. White & Brothers Millbank Street, Westminster.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

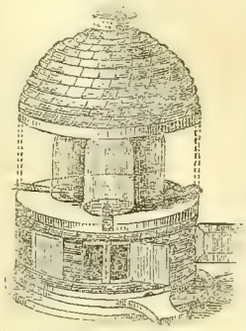
BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35s., securely packed for the country.



This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, F. & A. DICKSON & SONS, 106, Eastgate Street; Glasgow, AUSTEN & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

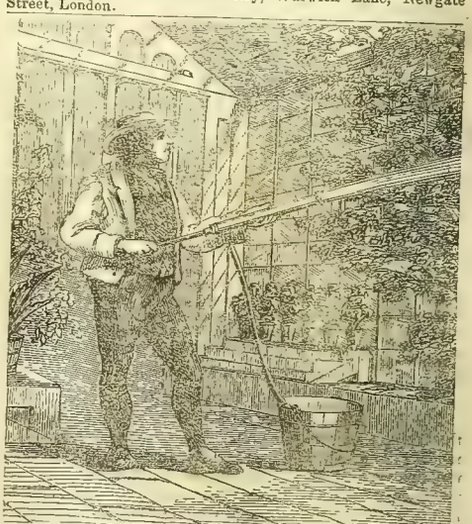
A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21s.; Plain Syringes from 10s. 6d. upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.



J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain who on application will forward wholesale and retail prices.

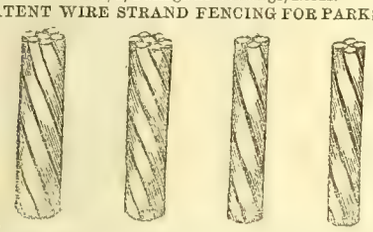
FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, ETC.

JAMES LYNE HANCOCK'S VULCANISED INDIA-RUBBER TUBING is now manufactured especially for the above purposes, and is of greater flexibility than any other description of hose or tubing. It is also manufactured to resist great pressure, suitable for attaching to the mains of water works or to tanks, or water butts of high elevations. WATERING HOSE fitted up with brass joints, branches, stop-cocks, roses, and jets complete. Vulcanised India-rubber suction pipes for pumps any length or size to order; HOSE for brewers' use, fire engines, &c. VULCANISED INDIA-RUBBER WASHERS, for Steam and Water Joints, and VULCANISED RUBBER in sheets of any size and thickness. Solid vulcanised India-rubber Tubing and Cord, for the joints of glass-doors, sashes, frames, &c.—Prices and every information may be had on application at the Manufactory, Goswell Mews, Goswell Road.

THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

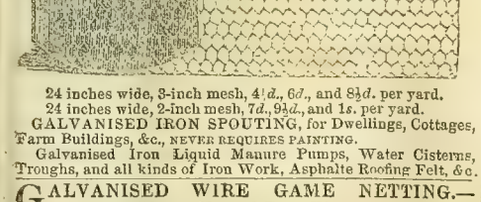
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

H. J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.

GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.

Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

GALVANISED WIRE GAME NETTING.—*7d.* PER YARD, 2 FEET WIDE.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24 inches wide ...	7*d.* per yd.	5*d.* per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1⅝-inch " light " ...	8 "	6 "
1⅝-inch " strong " ...	10 "	8 "
1⅝-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich; and delivered free of expense in London, Peterborough, Hull, or Newcastle.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

RIPE FRUIT, STRAWBERRIES, AND SEED BEDS.

NEW TWINE NETTING, Tanned if required, 1 yard wide, 1½*d.* per yard; 2 yards wide, 3*d.* per yard; 4 yards wide, 6*d.* per yard. Half-inch Mesh ditto, 2 yards wide, 6*d.* per yard. The Elastic Hexagon Garden Netting, 76 meshes to the square inch, effectually excludes birds, wasps, flies, &c., from fruit trees, flower or seed beds, 4½*d.* per square yard. Tanned Netting, 2 or 3 yards wide, 1½*d.* per yard; 4 or 6 yards wide, 3*d.* per yard.—At W. CULLINGFORD'S, 1, Edmund Terrace, Ball's-pond Road, Islington, London.

REDUCTION IN PRICE.

WEIR'S IMPROVED GALVANISED WROUGHT IRON LIQUID MANURE PUMP.

The Fittings of these Pumps are wholly of Brass, and there is no leather or other matter which can be affected by the manure.

Price, complete, with 10 feet of Flexible Suction Pipe, 4*l.* 15*s.* Terms, cash on delivery.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London. Removed from Oxford Street.

Catalogues, with Illustrations, sent free by post.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

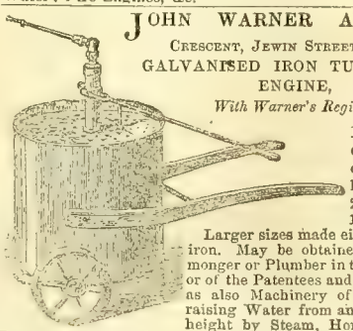
8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water: Fire Engines, &c.

JOHN WARNER AND SONS, CRESCENT, JEWIN STREET, LONDON.

GALVANISED IRON TUB GARDEN ENGINE,

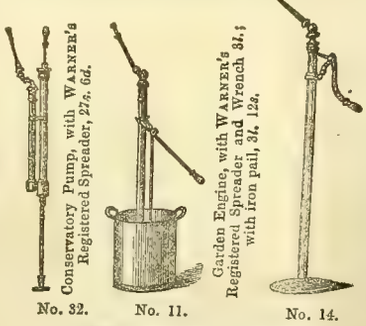
With Warner's Registered Spreader,



Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.



Conservatory Pump, with WARNER'S Registered Spreader, 27*s.* 6*d.*
Garden Engine, with WARNER'S Registered Spreader and Wrench 31.; with iron pail, 3*l.* 12*s.*
Patent Conservatory Pump, with WARNER'S Registered Spreader, 2*l.* 13*s.*; with iron pail, 3*l.* 5*s.*

No. 32. No. 11. No. 14.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

JAMES SCOTT AND CO., of Glasgow, have just opened their Premises in St. Paul's Churchyard (near the corner of Ludgate-hill), and respectfully invite Ladies to inspect their magnificent STOCK of SILKS, MANTLES, SHAWLS, DRESSES, DRAPERY, LACE, RIBBONS, &c.

77 and 78, St. Paul's Churchyard; and Trongate, Glasgow.

WANTED, BOARD AND LODGING IN THE COUNTRY for a Person in Reduced Circumstances.—His friends can only afford to pay a very moderate remuneration for the same.—S. M., 15, Beaufort Buildings, Strand, London.

SMALL STOCK FARM.

WANTED, to Rent on Lease (game to be included), from next Michaelmas, a small FARM, suitable for Stock, of about 80 or 100 acres, with respectable House and good Buildings, near a Railway Station, and about 20 miles from London.—Particulars and terms to be addressed to G. W., Mr. Clayton, Solicitor, 12, Serle Street, Lincoln's Inn, London.

IMPROVED MIDDLESEX PIGS.

TO BE SOLD, some fine young BOARS and SOWS of the above kind, being the surplus stock of an amateur. Also a CANTELO'S CHICKEN-HATCHING APPARATUS, nearly new.—A. M., Post Office, Turnham Green, Middlesex.

TO BE SOLD, by a Gentleman, GUTTA PERCHA HOSE, of 1½ inch diameter, and 210 feet long. It cost him, new, 8*l.* 15*s.*, or 10*d.* per foot, and he will take 6*l.* for it. He has not used it more than six times, so that it may be considered as good as new.—Enquire of Mr. CHARLES WALTER, 18, Temple Street, Fleet Street.

TO BE LET, A FARM, IN SURREY.—Mr. E. RYDE, Surveyor, is instructed to Let, with immediate possession (if desired), a very eligible and compact FARM, containing about 180 acres of good Arable, Meadow, and Hop Land; situate in the parish of Farnham, close to the Railway Station and (market) Town. The House is a good one, and there is, in addition, a Bailiff's Residence and several Labourers' Cottages, which, considered in connection with the economy and facility of Railway communication with the Metropolis, render it equally attractive to the Gentleman seeking a pleasure Farm as to the practical Agriculturist.—Further particulars may be obtained of Mr. RYDE, at his Estate, Auction, and Agency Offices, 14, Upper Belgrave Place, Pimlico; and of Messrs. RYDE & LILLYWHITE, Auctioneers, Alton, Hants.

BADLESMERE, NEAR FAVERSHAM, KENT.

TO BE LET, A COTTAGE, containing a good Parlour, 4 Bed-rooms, Kitchen, Washhouse, Pantry, Cellar, Chaise-house, Stable, and three-quarters of an acre of productive Garden and Fruit Plantation; situate at Badlesmere Lees, 4 miles from Faversham, 7 miles from Ashford, and 4 miles from the Chilham Station of the South Eastern Railway. The situation is elevated, healthy, and cheerful, and the roads excellent.—For particulars, and to view, apply to Mr. Whiting, Ospringe, Mr. Alfred Cobb, Badlesmere Court, near Faversham; or to Messrs. Simpson & Cobb, 62, Moorgate Street, London.

HOLYBOURNE, NEAR ALTON.

TO BE SOLD, a small compact BREWERY, Malt-house, Mill, Residence, and Cottage, with Garden, Orchard, and Meadow-land adjoining, containing in all five acres, more or less. The premises are situated close to the London-road, and within a mile of the Alton Railway station.—For particulars apply to Mr. DYER, Alton.

TO POULTRY AMATEURS.—A GREAT BARGAIN.

TO BE SOLD, in one Lot, or separately, about 130 HEAD of POULTRY, consisting of Brahmas, White Poland, Lemon, Black, Silver, Cinnamon, and White Cochins; Japanese Fowls, 4 kinds of beautiful Turkeys, and Aylesbury Ducks.—Apply immediately to A. Z., care of Mr. Bull, Station Master, Needham Market, Suffolk.

COCHIN CHINA POULTRY, ETC.
EGGS FROM PRIZE BIRDS.

MR. JOHN FAIRLIE, of Cheveley Park, Newmarket, in reply to the very urgent applications from numerous amateurs, is now prepared to dispose of a limited number of Eggs, from his celebrated prize Cochins, Brahma Pootras, Scotch Bakies, Dorkings, &c., according to the dates of the orders received.

MR. PEARSON having a few COCKS to dispose of, will send young Birds of Spotted Dorking, Gold Pencilled Hamburghs, and Silver Pencilled Hamburghs at 7*s.* 6*d.* each, including package.—Chilwell, near Nottingham.

BLACK COCHIN EGGS from the best birds in England, having always taken prizes at the best shows, at 18*s.* per dozen, including package. Apply at the city of London Wire Works, 44, Skinner Street, London. N.B. Fowl Houses, Chicken Coops, Poultry Hurdles, and Netting, of every size and description. Illustrated Catalogues forwarded, post free, on application. A few Spanish Pullets, sisters to those sent to her Majesty's yard at Windsor, for Sale.

Sales by Auction.

FANCY POULTRY & RABBITS.—PERIODICAL SALE.

MR. J. C. STEVENS'S next Sale will take place at his Great Room, 38, King Street, Covent Garden, on TUESDAY, July 4, at 12 o'clock precisely. It will include some first-class Dorkings, from Mr. George, of Chaldon, who has recently taken first prize at Bath; Brahma Pootra Fowls and Chickens, from Mrs. Cannon and Mr. Emery; and some very beautiful Cochins, from the yards of Capt. Snell, T. Rider, Esq., and other good breeders; also a first-rate collection of blue and blue and white Lopped-eared Rabbits, and several stacks capital Hutches, the property of a well-known amateur.—Catalogues ready one week before the sale, and will be forwarded by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden. These sales are held on the 1st and 3d Tuesdays in every month.

SPECIMEN STOVE AND GREENHOUSE PLANTS.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on FRIDAY, July 7th, at 12 for 1 o'clock, a collection of STOVE AND GREENHOUSE PLANTS, of a Gentleman who has been a most successful exhibitor at Chiswick and the Regent's Park, the plants are grown in the best manner, and comprise all the popular show varieties of Azaleas, Ericas, Ixoras, Allamandas, Epacris, &c., &c.—May be viewed on the morning of sale, and Catalogues had of Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

ORCHIDS.

THE MOST EXTENSIVE AND VALUABLE COLLECTION EVER OFFERED FOR PUBLIC SALE, CONTAINING FINE PLANTS OF ALL THE BEST SPECIES OF THIS ELEGANT TRIBE NOW IN CULTIVATION.

MR. J. C. STEVENS is instructed to announce for Sale by Auction, at his Great Room, 38, King Street, Covent Garden, on WEDNESDAY, 12th July, and following day, the Collection of ORCHIDS of a gentleman, the character of which will at once be understood by an enumeration of a few of the principal varieties. Vanda suavis (true), four plants, Cymbidium eburneum two plants, Aerides Larpentæ two plants, Saccolabium Blumei eight plants, Lælia purpurata two plants, Phalænopsis rosca, grandiflora and amabilis many plants, Cypripedium Lowi, Uropedium Lindeni, and all the best varieties of Aerides, Vandas, Saccolabiums, Cattleyas, Trichopilias, Calanthes, Lælias, Dendrobiums, Angræcums, Miltonias &c. Catalogues are preparing.

STRATFORD ST. MARY, NEAR COLCHESTER.

Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

PROTOXIDE ANTI-CORROSION PAINT, for all external purposes, on iron, wood, brickwork, or stucco, is cheaper, and more durable, than any similar article.—Manufactured by CHARLES FRANCIS & SONS, Cement Works, Nine Elms, London.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

COWS.

HARVEY'S CELEBRATED COW DRINKS, 1s. each. They have been used with unparalleled success in most diseases incidental to Cows. Full and plain directions are given with each drink for the treatment of Hoven, Mawbound, Colds, Gargle, Red Water, the Tick or Foot and Mouth Distemper, at and after Calving, &c. A very extensive use of these drinks has proved them to be a safe and effectual remedy.

Compounded by R. HARVEY, Veterinary Surgeon, Macclesfield, Cheshire, and sold by all Medicine Vendors. Wholesale Agents, BARCLAY & SONS, Farringdon Street; and MARSDEN & SONS, Queen Street, Cheapside, London.

IMPORTANT TO

SHEEP, LAMBS, HORSES, AND CATTLE,

CAN BE DRESSED WITH

LONG'S NON-POISONOUS SHEEP & CATTLE-DRESSING COMPOSITIONS, without any possibility of danger or injury resulting from the application. These Compositions are admitted by all who have fairly tested them to be the most effective Sheep Dressings ever brought before the agricultural public; and as they are NON-POISONOUS, and do not stain or discolour the Wool, they are gradually superseding the use of all Dipping and other Sheep-dressing preparations, composed of such deadly poisons as ARSENIC or MERCURY.

It is a fact now thoroughly established, that Long's Non-Poisonous Sheep Dressings, if liberally and judiciously applied in the dressing of Sheep and Lambs, will—in their consequent effect in removing Disease, destroying Vermin, and keeping the flock in condition—thus PROMOTING INCREASED GROWTH BOTH OF MUTTON AND WOOL—as amply repay flock owners for first outlay as artificial manures when applied to land. They are the only Sheep Dressings also, which, from the fact of their containing NO POISON, can be beneficially and safely applied to Sheep and Lambs at any age and at any season of the year.

Pamphlets, containing full directions for use, and copies of the strongest Testimonials ever accorded to a manufacturer, signed by leading and practical Stock Farmers, residing in all parts of the United Kingdom, together with the names of all Country Agents authorised to vend Long's Patent Sheep and Cattle-dressing Compositions, may be obtained gratuitously on application of any advertised country Agent; or by post, sent free, of

BARRY BROTHERS, AGENTS FOR JOSEPH LONG,
Meriton's Wharf, and Shad Thames, London.

THE CHOLERA—ITS BEST ANTIDOTE.

SIR W. BURNET'S DISINFECTING FLUID, the original and genuine CHLORIDE OF ZINC.—Sold by all Chemists, Druggists, and Shipping Agents; and at the Office, 18, Cannon Street, London Bridge.

N.B. Beware of a spurious and low-priced imitation.

THE CHOLERA

PREVENTED BY THE DESTRUCTION OF ALL NOXIOUS EFFLUVIA.

CREWS'S DISINFECTING FLUID, Recommended by the College of Physicians. The Cheapest and Strongest Chloride of Zinc.—Quarts. 2s.; Pints, 1s.; Half-pints, 6d. Sold by all Chemists, Druggists, and Shipping Agents; and at Commercial Wharf, Mile End, London.

GLENFIELD PATENT STARCH, used in her Majesty's Laundry, and WOTHERSPOON'S machine-made CONFECTIONARY, MARMALADE, JAMS, JELLIES, &c., which gained the Prize Medal of 1851, may be had of all Grocers; Wholesale of WOTHERSPOON, MACKAY, & Co., 66, Queen Street, Cheapside, London; and ROBERT WOTHERSPOON & Co., Glasgow.

BERDOE'S VENTILATING WATERPROOF LIGHT OVER-COATS resist any amount of rain, without confining perspiration, the fatal objection to all other waterproofs, air-tight materials being unfit and dangerous for clothing, and being free from vulgar singularity are adapted for general use equally as for rainy weather. Price 45s. and 50s. A large stock for selection. Also of Capes, Shooting Jackets, Ladies' Mantles, Habits, &c.—W. BERDOE, Tailor, &c., 96, New Bond-street, and 69, Cornhill (only).

THE CRYSTAL PALACE, SYDENHAM.

GLENNY'S BALBRIGGAN STOCKINGS and SOCKS are displayed in the South End Gallery, over the garden. The elegance of these beautiful Irish Fabrics is surpassed by their great durability and comfort. Sold only by the manufacturer, CHARLES GLENNY, at his depôt, Balbriggan House, Lombard Street, and by THRESHER & GLENNY, next door to Somerset House, Strand, London.

MR. MECHI wishes it to be clearly understood, that he CHARGES the same PRICES at the CRYSTAL PALACE as at Leadenhall Street; that his manufactures are varied to suit all classes. For instance, Dressing-cases at 25s., or at 150/.; Penknives at 1s., or 21s.; Tooth Brushes at 6d., or 2s., each article being good of its sort. Mr. MECHI's Assistants at the Crystal Palace will attend constantly to receive orders and dispose of his manufactures there.—4, Leadenhall Street, July 1.

CRYSTAL PALACE, 1854.

THE OFFICIAL GUIDE AND HANDBOOKS,

ILLUSTRATIVE of the CONTENTS of the EXHIBITION, are now on Sale, and may be had separately, at prices varying from Threepence to Eighteenpence; or handsomely bound in 3 Vols., price 4s. 6d. each. To be had at the PALACE, and at all Booksellers and Railway Stations, and of

BRADBURY & EVANS, Printers and Publishers to the Crystal Palace Company, 11, Bouverie Street.

Price 1s. 6d., free by post 1s. 10d.

ANEMONES.

JOHN HOADE, FLORIST and SEEDSMAN, Addlestone, near Chertsey, Surrey, begs to offer his first-rate ANEMONE SEED; his collection this Spring is allowed to be equal to anything yet produced for brilliancy and variety. A packet forwarded with printed particulars for sowing and after-culture, on receipt of 13 postage stamps.

ALPINE PLANTS OF SCOTLAND.

MR. KERR, A.B.S.E., having this season undertaken a Botanical Tour to the lofty mountains of Clova and Braemar, will be happy to supply sets of dried specimens of the Rare Alpine Plants, at the following rates:—150 specimens, 1*l.* 1*s.*; 100 do., 14*s.*; 50 do., 7*s.*—Address, Mr. ANDREW KERR, Murray Street, Montrose.

PLANTS OF CABBAGE, SAVOY, KALE, BROCCOLI, CAULIFLOWER, AND CELERY.

JOHN CATTELL, Westerham, Kent, begs respectfully to inform the public that he has a plentiful supply of Plants of his superior true sorts of the above, which will be forwarded to order on receipt of Postage Stamps or Post Office Order made payable here at the following prices, package included:—All the sorts of Early Cabbage, Savoy, and Kale, including Brussels Sprouts, 6*d.* per 100; 4*s.* 6*d.* per 1000. All the sorts of Autumn and Spring Broccoli, and all the sorts of Celery, 8*d.* per 100; 6*s.* 6*d.* per 1000. Cauliflower, Early and Late, 10*d.* per 100. Red Cabbage, 1*s.* per 100; Drumhead, or Cattle Cabbage, 4*s.* per 1000. Packages of 1000 and upwards delivered free of Carriage to London, and to the Edenbridge Station of the South Eastern Rail.

Seed of Cattell's Dwarf Barnes, and of his superior Dwarf Reliance Cabbage, may be had in packets by post for 12 Penny Stamps per packet; the former containing one ounce as usual, and the latter half an ounce.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21*s.*

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gaufred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21*s.*

NEW BEDDING PLANT.
CALCEOLARIA AJAX.

LUCOMBE, PINCE, AND CO., are now sending out healthy Plants of their much admired

NEW SHRUBBY CALCEOLARIA.

It is now flowering profusely in their Nursery, and they respectfully call attention to it. See *Gardeners' Chronicle*, May 6th.

42*s.* per dozen; a few strong plants at 7*s.* 6*d.* each.

Exeter Nursery, Exeter.

CHOICE CINERARIA
AND
CALCEOLARIA SEEDS.

LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior

CINERARIAS AND CALCEOLARIAS,

which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias and Calceolarias have given for several successive years enables them to recommend their Seed of the present season with much confidence.

Packets of each, sealed and warranted by them, at 2*s.* 6*d.*, free by post.—Exeter Nursery, Exeter, July 8.

ROSES.

G. CLARKE respectfully invites the attention of lovers of Roses to his unrivalled Collection, extending over 10 acres of ground, which may now be seen in full bloom. Plants can be selected now and orders executed in the autumn.

Streatham Place Nursery, Brixton Hill, near London; four miles from London The nearest and most pleasant route from the West End to the Crystal Palace.

OSBORN AND SONS have the pleasure to acquaint the public that they are now prepared to send out the following new plants:—

OXYLOBIUM OSBORNI.

This beautiful new Oxylobe obtained the Large Silver Medal at the Chiswick Exhibition in June, 1853. From its graceful habit, and bearing its bright orange-coloured flowers in such abundance, it will, we have no doubt, become a general favourite. Price 10*s.* 6*d.* each.

LYSIMACHIA LESCHENAULTI.

An exceedingly pretty plant, with dense heads of pink flowers, raised from seeds received from the Neilgherry Hills; it is a most abundant bloomer, and easy of cultivation. It was awarded the second prize for new plants at the Regent's Park, June 1854. Price 5*s.* each.

PENTAS ROSEA.

A decided improvement on the Pentas carnea, having much darker coloured flowers. Price 3*s.* 6*d.* each.

The usual discount to the trade.

Fulham Nursery, near London, July 8.

NEW ROSES IN POTS.

W. J. EPPS, of Maidstone and Ashford, can now supply fine strong Plants of the following new ROSES. The Plants average from 10 to 20 buds, fit for immediate working.

W. J. E. can offer choice varieties, such as Queen Victoria, Egarie, Triomphe de Valenciennes, Standard de Marengo, L'Ergant Vere, Madame Campbell, Palais de Cristal, &c., at 30*s.* per dozen, or 2*s.* 6*d.* each.

PHLOX DRUMMONDI RADETZKI.

JOHN CATTELL has a large stock of this very beautiful PHLOX, which is a great improvement on Mayi, having the white clearer, and the purplish crimson much deeper and brighter; every flower comes as regularly and constantly striped, and the habit of the plant is more robust; it is so very handsome that it must become a general favourite. Good Plants, 3*s.* 6*d.* each, or 36*s.* per dozen; extra fine Plants, 5*s.* each. A liberal discount to the trade. A flower may be had on application, enclosing a penny stamp.

J. C. has also to offer the following very desirable plants, well established:— Each. 2*s.* 6*d.*

GERANIUM, crimson ivy-leaved

GERANIUMS OF THE SCARLET HABIT.

Anemone pavonia, brilliant scarlet, double, very hardy, flowers in March and April, Bulbs now ready to transplant, 4*s.* per dozen, or 25*s.* per 100.

A remittance or reference to accompany all orders from unknown correspondents.—Westerham, Kent.

ORANGE JELLY TURNIP SEED.

PURCHASERS OF LARGE QUANTITIES will be supplied liberally, for cash payment, on application to Messrs. SUTTON AND SONS, SEED GROWERS, Reading, of whom it may also be had retail at same price as at Chester. Early orders will be first executed.

SUTTON'S IMPERIAL CABBAGE. — THE EARLIEST SORT IN CULTIVATION, large and fine flavour. This sort may be sown immediately without any risk of the plants running to seed. Price 1*s.* per ounce, post free.

JOHN SUTTON and SONS, Nos. 7 and 8, Market Place, Reading, Berks.

GENUINE DRUMHEADS FOR CATTLE.

THOMAS WELLAND, Surrey Gardens, near Godalming, Surrey, can supply Fine Plants of the above, packed and delivered at the Godalming Station, at 3*s.* per 1000.

DRUMHEAD CATTLE CABBAGE PLANTS.

JOSEPH SHILLING, NURSERYMAN and SEEDSMAN, Winchester, has a large Stock of the above Plants, which he will send by Railway at 3*s.* per 1000, package included.

WILLIAM WOOD AND SON beg leave to intimate that their extensive Plantations of ROSES are now coming into fine bloom, and will remain in perfection during the Rose season. Maresfield is distant from Lewes 10 miles, and Hayward's Heath 12, both of which places are Stations on the London and Brighton Railway, and from whence conveyances may be obtained.

PINK.

NORMAN'S COLCHESTER CARDINAL.—For Sale, about 500 Pipings of this splendid PINK, which received a First Class Certificate from the National Floricultural Society, July 1st, 1852, and was designated as—Purple, fine leaf; large and full; fine pod, and best of its class; and figured in the October number of the "Florist." Four pairs, 5*s.*; 25 pairs 20*s.*; including package and postage, on receipt of Post-office order or stamps.—Address, Mr. ROBERT HALLS, High Street Colchester, Essex.

CINERARIA SEED.

EDWARD GEORGE HENDERSON AND SON, Wellington Nursery, St. John's Wood, London, are now prepared to forward, by post, new Cineraria Seed saved this season. More than usual care has been bestowed in gathering from the choicest named varieties, including the new ones sent out last year; all the light varieties have been discarded, consequently from the above seed we anticipate none but high coloured flowers. Per packet, 2*s.* 6*d.* and 5*s.* each.

Our beautiful collection of CALCEOLARIAS can now be seen in flower at the Nursery, and orders for seed booked, to be sent when ready. Per packet, first quality, 5*s.*; second quality, 2*s.* 6*d.*

SPLENDID NEW RHUBARB.
SALT'S CRIMSON PERFECTION.

ROBERT SALT, GARDENER, Longton, Staffordshire, will send out roots of this early, productive, and delicious variety of Rhubarb this autumn: see *Gardeners' Chronicle* June 11, 1853: "Very good, and most beautiful crimson; compared with others, it is remarkable for the small amount of acidity it contains."

A Certificate of Merit was awarded for specimens exhibited at the meeting of the London Horticultural Society, June 28, 1853; likewise a first-class Certificate at Nottingham Horticultural Society, May 24, 1854; and at the Midland do., May 25, 1854.

Single roots, 7*s.* 6*d.*, three for one guinea, and six for 2*l.* Orders forwarded now to ROBERT SALT, or to HURST & M'MULLEN, 6, Leadenhall Street, London; Mr. Wood, Nurseryman, Coppice, near Nottingham; Messrs. Burgess & Kent, Nurserymen, Penkhull, will have the earliest attention. A Post-office order requested from unknown correspondents.—Longton, July 8.

CHOICE NEW FUCHSIAS, VERBENAS, AND PETUNIAS.

To Mr. Nicols, Gardener to Sir I. L. Goldsmid, Bart., The Wick, Brighton, for a dish of Nectarines.
To Mr. Monro, Gardener to Mrs. Oddie, Colney House, St. Alban's, Herts, for 4 dishes of Peaches and Nectarines.
To Mr. Turnbull, Gardener to Duke of Marlborough, Blenheim Palace, Oxon, for 4 dishes of Peaches and Nectarines.
To Mr. J. Cowan, Gardener to E. Jones, Esq., the Grove, Wanstead, Essex, for 2 dishes of Peaches and Nectarines.
To Mr. Brown, Gardener to W. C. Cartwright, Esq., Aynho Park, Northampton, for 2 dishes of Peaches and Nectarines.
To Mr. Lydiard, Market Gardener, Bath, for 2 dishes of Strawberries.
To the same, for 4 dishes of Strawberries.
To Mr. B. S. Williams, Gardener to C. B. Warner, Esq., Hoddesdon, Herts, for Tropical Fruits.
To Mr. Spencer, Gardener to the Marquis of Lansdowne, Bowood Park, Chippenham, Wilts, for 3 Queen Pines.
To Mr. Monro, Gardener to Mrs. Oddie, Colney House, St. Alban's, Herts, for 2 boxes of Nectarines.
To Mr. Constantine, Gardener to C. B. Mills, Esq., Hillingdon, near Uxbridge, for a box of Peaches.
To Mr. Henderson, Gardener to Sir G. H. Beaumont, Bart., Hoddesdon, Herts, for a box of Nectarines.

BRONZE MEDAL.

To Mr. Jarvis, Gardener to J. Ruck, Esq., Croydon Lodge, Croydon, for 10 Stove and Greenhouse Plants.
To Mr. Hamp, Gardener to J. Thorne, Esq., Mawbey House, South Lambeth, for 10 Stove and Greenhouse Plants.
To Mr. Jarvis, Gardener to J. Ruck, Esq., Croydon Lodge, Croydon, for 6 Cape Heaths.
To Mr. Epps, Bower Nursery, Maidstone, Kent, for 6 Cape Heaths.
To Messrs. A. Henderson, Nurserymen, Pine-apple Place, Edgeware Road, for Begonia xanthina.
To Mr. Gedney, Gardener to Mrs. Ellis, Hoddesdon, Herts, for 12 Exotic Ferns.
To Dr. Allchin, 7, Pembridge Villas, Westbourne Grove, Paddington, for 30 British Ferns.
To Mr. Smith, Gardener to J. Anderson, Esq., The Holme, Regent's Park, for 30 British Ferns.
To Messrs. Rollisson and Sons, Nurserymen, Tooting, Surrey, for correct labels.
To Mr. Bragg, Star Nursery, Slough, Bucks, for 24 Cut Pinks.
To the same, for 36 Cut Pansies.
To Mr. Wilkinson, Rose Nursery, Ealing, Brentford, Middlesex, for 50 cut Roses.
To Mr. Carter, Gardener to H. Hughes, Esq., Woodgate, Uckfield, Sussex, for 25 Cut Roses.
To Messrs. Paul, Nurserymen, Cheshunt, Herts, for 24 blooms of Roses.
To Mr. Turner, Royal Nursery, Slough, for 12 Carnations.
To the same, for 12 Picotees.
To Mr. G. Smith, Florist, Hornsey Road, Islington, for Cut Verbenas.
To Messrs. E. G. Henderson, Wellington Road, for Sikkim Rhododendrons from the Bhotan Alps.
To Mr. Lydiard, Market Gardener, Bath, for a Green-fleshed Melon.
To Mr. Monro, Gardener to Mrs. Oddie, Colney House, St. Alban's, Herts, for a Green-fleshed Melon. Egyptian Hybrid.
To the same, for Green-fleshed Melon, Pine-apple.
To Mr. M'Ewen, Gardener to the Duke of Norfolk, Arundel Castle, Sussex, for Scarlet-fleshed Melon.
To Mr. Mitchell, Market Gardener, Bristol Gardens, Brighton, for 3 dishes of Grapes.
To Mr. Harrison, Market Gardener, Oatlands Palace Gardens, Weybridge, Surrey, for 12 lbs. of Grapes.
To Mr. Monro, Gardener to Mrs. Oddie, Colney House, St. Alban's, for 12 lbs. of Grapes.
To Mr. Hughes, Gardener to J. Eaton, Esq., Shacklewell, Middlesex, for a dish of Black Hamburgh Grapes.

(*For continuation see next page*).

ROYAL BOTANIC SOCIETY'S LIST OF AWARDS *continued.*

To Mr. Williamson, Gardener to the Earl of Lonsdale, Whitehaven Castle, Cumberland, for Black Hamburgh Grapes.
To Mr. Wood, Gardener to C. Scott Murray, Esq., Danesfield, Bucks, for a dish of Black Hamburgh Grapes.
To Mr. Tegg, Gardener to A. Prior, Esq., Roehampton, for a dish of Black Hamburgh Grapes.
To Mr. Harrison, Market Gardener, Oatlands Palace Gardens, Weybridge, Surrey, for a dish of Black Hamburgh Grapes.
To Mr. Monro, Gardener to Mrs. Oddie, Colney House, St. Alban's, Herts, for a dish of Black Hamburgh Grapes.
To Mr. Bassett, Gardener to F. B. Herring, Esq., East End, Finchley, for a dish of Black Hamburgh Grapes.
To Mr. Forbes, Gardener to the Duke of Bedford, Woburn Abbey, Bedford, for a dish of Black Hamburgh Grapes.
To Mr. Cowan, Gardener to E. Jones, Esq., The Grove, Wanstead, Essex, for a dish of Black Prince Grapes.
To Mr. Allport, Gardener to — Ackroyd, Esq., Doddington, for a dish of Muscat Grapes.
To Mr. Tillyard, Gardener to Hon. C. Shaw Lefevre, Heckfield Place, Hartford Bridge, Hants, a dish of Muscat Grapes.
To Mr. Miller, Gardener to Sir W. Smith, Eardisdon House, Worcester, for 4 dishes of Peaches and Nectarines.
To Mr. Collins, Gardener to Sir C. H. Chapman, Hannigay House, Hornsey, for 4 dishes of Peaches and Nectarines.
To Mr. Monro, Gardener to Earl of Clarendon, Grove Park, Watford, Herts, for 2 dishes of Peaches and Nectarines.
To Mr. Ruffett, Gardener to Lady Palmerston, Brochett Hall, Herts, for 2 dishes of Peaches and Nectarines.
To Mr. Bore, Spring Hill, Winkfield, Berks, for 2 dishes of Peaches and Nectarines.
To Mr. Allport, Gardener to — Ackroyd, Esq., Doddington Park, Nantwich, Cheshire, for a dish of Apricots.
To Mr. M'Ewen, Gardener to the Duke of Norfolk, Arundel Castle, for a dish of Plums.
To Mr. Snow, Gardener to Earl de Grey, Wrest Park, Silso, Beds, for a dish of Figs.
To Mr. Mockett, Gardener to — Allnut, Esq., Clapham Common, for a dish of Figs.
To Mr. Tillyard, Gardener to the Hon. C. Shaw Lefevre, Heckfield, Hants, for 2 dishes of Strawberries.
To Mr. M'Ewen, Gardener to the Duke of Norfolk, Arundel Castle, for 4 dishes of Strawberries.
To Mr. Ward, Gardener to W. Stephens, Esq., Prospect Hill, Reading, Berks, for a dish of Seedling Strawberries (Omer Pacha).
To Mr. Bore, Spring Hill, Winkfield, Berks, for 1 dish of Strawberries.
To Mr. Ivison, Gardener to the Duke of Northumberland, Syon House, for Snake and Club Gourds.
To Mr. Snow, Gardener to Earl de Grey, Wrest Park, Silso Beds, for a dish of Black Cherries.
To the same, for a dish of White Cherries.

CERTIFICATE.

To Mr. Speed, Edmonton, for Correct Labels.
To Mr. Bryan, Nurseryman, Whitton, Hounslow, for 36 Cut Pansies.
To Mr. Turner, Royal Nursery, Slough, for Seedling Pelargonium Una.
To Mr. Terry, Gardener to Lady Puller, Youngsbury, Ware, Herts, for 25 Cut Roses.
To Mr. M'Pherson, Gardener to Lord Calthorpe, Perry Hall, Staffordshire, for 25 Cut Roses.
To Mr. Hume, Gardener to R. Hanbury, Esq., Poles, near Ware, Herts, for 24 Blooms of Roses.
To Mr. Epps, Bower Nursery, Maidstone, Kent, for 24 Blooms of Roses.
To Mr. Terry, Gardener to Lady Puller, Youngsbury, Ware, Herts, for 24 Blooms of Roses.
To Mr. Munro, Gardener to the Earl of Clarendon, The Grove, Watford, Herts, for 24 Blooms of Roses.
To Mr. Turner, Royal Nursery, Slough, for a Specimen Pelargonium Rowena.
To the same, Royal Nursery, for Seedling Verbena.
To Mr. Gaines, Nurseryman, Surrey Lane, Battersea, for a box of cut Iris blooms.
To Mr. Bragg, Star Nursery, Slough, for 24 Sweet Williams in pots.
To Mr. Barter, Gardener to A. Blythe, Esq., Kiddepore Hall, New West End, Hampstead, for 4 Achimenes.
To Mr. Cole, Nurseryman, St. Alban's, Herts., for Seedling Calceolaria, Eclipse.
To Mr. Parker, Nurseryman, Dalston, for cut blooms of Seedling Ranunculi.
To Mr. Wetherell, Gardener to D. McNeile, Esq., Hornsey Road, Islington, for Cut Verbenas.
To J. Edwards, Esq., Priory Cottage, Holloway, for a collection of Scarlet Pelargoniums.
To Dr. Allchin, 7, Pembridge Villas, Westbourne Grove, for 12 Monstrosities of Scolopendrum.
To Messrs Wood & Son, Nurserymen, Maresfield, Uckfield, Sussex, for Seedling Rose, Duchess of Norfolk (Hybrid Perpetual).
To Mr. Bailey, Gardener to T. Drake, Esq., Shardeloes, Bucks, for Green-fleshed Melon.
To Mr. Cullingham, Gardener to Miss Traill, Haye's Place, Bromley, Kent, for Green-fleshed Melon.
To Mr. McEwen, Gardener to Duke of Norfolk, Arundel Castle, Sussex, for a Green-fleshed Melon, Golden Drop.
To the same, for a Green-fleshed Melon, Golden Perfection.
To Mr. M. Henderson, Gardener to Sir G. H. Beaumont, Coleorton Hall, Ashby de la Zouche, Leicestershire, for 12 lbs. of Grapes.
To Mr. Gadd, Market Gardener, Surrey, for 12 lbs. of Grapes.
To Mr. Miller, Gardener to Sir W. Smith, Bart., Eardesdon House, Worcestershire, for 12 lbs. of Grapes.
To Mr. Morrison, Gardener to E. Donnivan, Esq., Uckfield, Sussex, for 12 lbs. of Grapes.
To Mr. Mitchell, Market Gardener, Bristol Gardens, Brighton, for 12 lbs. of Grapes, Muscats of Alexandria.
To the same, for 12 lbs. of Grapes, Brighton Muscadine.
To Mr. Corney, Market Gardener, Bury St. Edmund's, Suffolk, for 12 lbs. of Grapes.
To Mr. Moffatt, Gardener to the Duke of Newcastle, Clumber Park, Worksop, Nottinghamshire, for 4 dishes of Peaches and Nectarines.
To Mr. Watson, Market Gardener, Ealing, for 4 dishes of Peaches and Nectarines.
To Mr. Davis, Market Gardener, Oak Hill, Barnet, for 2 dishes of Peaches and Nectarines.
To Mr. Monro, Gardener to Mrs. Oddie, Colney House, St. Alban's, Herts, for 2 dishes of Peaches and Nectarines.
To Mr. Tillyard, Gardener to the Hon. C. Shaw Lefevre, Heckfield, Hants, for a dish of Plums.
To Mr. Constantine, Gardener to C. B. Mills, Esq., Hillingdon, Uxbridge, Middlesex, for a dish of Figs.
To Mr. Tillyard, Gardener to the Hon. C. Shaw Lefevre, Heckfield, Hants, for the same.
To Mr. Mitchell, Market Gardener, Bristol Gardens, Brighton, for a dish of Black Cherries.
To Mr. Head, Nurseryman, Worthing, Sussex, for a dish of Black Cherries.
To Mr. Tillyard, Gardener to the Hon. C. Shaw Lefevre, Heckfield, Hants, for a dish of Black Cherries.
To Mr. Spencer, Gardener to the Marquis of Lansdowne, Bowood Park, Chippenham, Wilts, for a dish of White Cherries.
To Mr. Hume, Gardener to R. Hanbury, Esq., Poles, near Ware, Herts, for 4 dishes of Strawberries.
To Mr. Harrison, Market Gardener, Oatlands Palace Gardens, Weybridge, for the same.
To Messrs Lane and Son, Nurserymen, Great Berkhampstead, Herts, for a collection of Fruit Trees in Pots.

ERRATA IN AWARDS FOR JUNE, ADVERTISED AT P. 402.

2d col., W. Irving Hall, Esq., should be W. Irving, Esq., of Hull.
Do., A Silver Medal is by mistake awarded to Mr. Henderson, Gardener to Sir G. Beaumont, for a box of Peaches.
Do., To Mr. Holder, Gardener to the Rev. E. Coleridge, for 24 Cut Pinks, read 24 Cut Pansies.
Do., Small Silver Medal awarded to Messrs. Standish and Noble, for Hæmanthus Rooperi, should have been to Mr. Epps, for that plant.
Do., Omitted to be inserted, Small Silver Medal, awarded to Mr. Summerfield, for 6 Exotic Orchids.
3d col., Bronze Medal, to Mr. Gedney, Gardener to Mrs. Ellis, for 12 Exotic Orchids should be 12 Ferns.
Do., Mr. Whiting, the Deepdene, for Green-fleshed Melon, instead of Bronze Medal read Certificate.
Do., Mr. Busby, for Strawberries, instead of Bronze Medal read Certificate.
Do., Omitted to be inserted: Certificate awarded to Mr. Smith, Gardener to S. Ricardo, Esq., Totnes Park, for Green-fleshed Melon.
Do., Mr. Marcham, Gardener to J. Smith, Esq., Bydorp House, Hanwell, Middlesex, for a dish of Black Cherries.
Do., Mr. Mitchell, Market Gardener, Bristol Gardens, Brighton, for a dish of White Cherries.

LASTREA FILIX MAS VAR. CRISTATA,
ATHYRIUM FILIX FŒMINA VAR. MULTIFIDUM.

ROBERT SIM begs to draw the attention of Growers of HARDY FERNS to these extremely beautiful and unequalled British varieties.

LASTREA FILIX MAS VAR. CRISTATA.—Fronds 2 feet long, pinnæ broadly multifid at their points, giving the whole plant an unique and very elegant appearance. Very rare. Fine young plants, 5*s.*, and larger 7*s.* 6*d.* each. Small do. by post, 3*s.* 6*d.* each.

ATHYRIUM FILIX FŒMINA VAR. MULTIFIDUM.—Fronds 2 feet long, pendant, the ends of the pinnæ so much multifid as to appear tasselled. Fine young plants, 5*s.* each.

They form elegant Conservatory Ferns also.

Carriage free to London. Post-office orders on Chiselhurst. Nursery, Foot's Cray, Kent.

The Gardeners' Chronicle.

SATURDAY, JULY 8, 1854.

THE POTATO QUESTION seems likely to assume a new form. Raising from seed has failed to preserve the plant from disease, and so has the importation of sets from Peru, as well as a selection of varieties. No one can say that a cure has been found among the many nostrums which have had their admirers; artificial manures, pickles, and steeps are exploded; even peculiar modes of preparing the tubers have been more or less unsuccessful, and such improvement as has taken place in the health of the plant is either due to better cultivation or to a gradual wearing out of the affection. We now find, in the "Revue Horticole," an account of another kind of *Solanum*, called *verrucosum*, which may possibly be destined to perform an important part in the regeneration of the Potato.

It has long been known that in the west of Mexico there exist certain Potato-like plants, producing tubers, and approaching very near to the cultivated species. Some account of them was given in 1848 in the third volume of the Journal of the Horticultural Society. Among the species there mentioned, allusion was made to a *Solanum verrucosum*, which produced very small tubers, not exceeding 1½ inch in length, and which was regarded as of no value in cultivation, although, even in the bad year 1847, it exhibited no trace of disease. It appears, however, as if, in the hands of the French, it were destined to acquire some importance.

A Monsieur PARGUES states that, at Vesoul, in the Haute-Saône, he received, in May, 1853, from the Horticultural Society of Ain, a dozen tubers of this sort, about the size of Walnuts. They were perfectly sound, the skin was a clear rose colour, modified by a slight yellowness appearing through it. In quality they were mild and pleasant, and as good as the very best varieties of the common Potato. They were the result of three years' culture in the neighbourhood of Ain, where they had been grown in good, rich, well worked land, without any material increase in size.

It, however, proved far otherwise with M. PARGUES. He states that his tubers were planted early in May in common garden soil, which was cleaned twice during the season. On the 6th of September he took up the produce of 10 of these tubers, and found they had each yielded from 23 to 25 ounces; some of the new Potatoes weighed as much as 6 ounces; but others were not larger than Walnuts. It thus appeared that while in the rich well worked soil of Ain the Potatoes were too small to be of any use, in the common garden ground at Vesoul they acquired a fair size, and justified the expectation that by raising this Potato from seeds the size would be gradually increased. What renders this a very important consideration is, that the plants of *Solanum verrucosum* were quite free from disease, although common Potatoes planted by their side were attacked as early as the end of July; and we have the evidence of Prof. DECAISNE, that in the Garden of Plants, at Paris, the same power of resisting disease was remarked.

Under these circumstances it seems desirable to procure sets of the *Solanum verrucosum*, which could be easily done by any of the English correspondents of Messrs. VILMORIN, of Paris. Attempts might then be made to improve the new kind, either directly by sowing its seeds, or indirectly by crossing it with such sorts as the Fluke. Should this be practicable, it is to be anticipated that we may at once come into possession of a good large Potato with a perfectly sound constitution—a result which we need not say would be cheaply purchased with any amount of trouble or expense.

WE suspect that few understand the exact relation that exists between the Sovereign of this country and those possessions which are administered by the functionaries called Commissioners of Woods and Forests. Were it more generally known that the maladministration of which such grievous complaints have long been made affected the fortune of the Crown as well as the public revenue, we cannot but suppose that those who have the power would take immediate steps to put an end to the system which has so long prevailed. A brief explanation of this matter will, we trust, assist in enabling the public to judge whether the question is not one of the utmost gravity.

In the course of ages the Sovereign of England has acquired large possessions, rights, and privileges, which yield what are called the hereditary revenues. These are derived from the rents and profits of the demesne lands of the Crown, *profits arising from Royal Forests*, and various other sources. In the reign of KING GEORGE IV. a sum of 1,057,000*l.* was settled upon his Majesty for the payment of the civil list, upon consideration of the monarch *having placed his hereditary revenues at the disposal of the House of Commons.* In other words, the King sold his life interest in the Royal revenues for an annuity of something like a million sterling. KING WILLIAM IV. made the same arrangement, receiving only 510,000*l.* a year, but being relieved from all payments relating to the administration of justice and the support of the great officers of state. Upon the accession of her present Majesty, the same arrangement was made, with this difference, that the Queen received something less than 400,000*l.* a year, in exchange for her Majesty's life interest in her hereditary revenues.

As we have already stated, the Commissioners of Woods and Forests are charged with the important duty of managing a large part of these revenues, and we take it to be their duty to secure for the public the utmost value for the property placed under their charge, so as to show that the surrender of the Royal life interest is a good consideration for the annuity which is paid. If the revenue exceeds the amount of the annuity, the grantee has the satisfaction of knowing that the grantor (the nation) is placed in a better position than he had a right to expect. On the other hand, should the revenue be less than the annuity, then the grantee is exposed to the chance of misrepresentations which ought on every account to be avoided; and, what is of much more importance, the successor to the throne is signally wronged. Diminution of annual value, such as we have seen in the Royal forests, may end in placing another monarch in the position of a suitor to the country for a maintenance, instead of his being able to claim it as a mere equivalent for valuable rights surrendered. Seeing what unexpected events are continually occurring in the political world, it is impossible for any one to say that some future Sovereign of this realm will not find himself at the mercy of a parsimonious Parliament, instead of standing in the independent position of a great prince, inheriting from his ancestors a revenue sufficient for his Royal state.

If this is a just view of the case, the importance of exercising a jealous supervision over the department of government entrusted with the management of the Royal revenues cannot be over-estimated, although it seems to have been the last subject thought of by the guardians of the public interest during the present century. And it is for this reason, seeing how old abuses flourish and new abuses spring up where the Royal property is concerned, that we have endeavoured to use such small knowledge as we chance to possess in exposing a system which nobody ventures to defend, but which, nevertheless, continues to flourish and bids defiance to reform. Most certainly it has not been for the sake of disturbing a few obscure forest officers in remote places, who, as we have formerly said, are less to blame than those in high station who, regardless of the interests of the Crown, assigned to them duties which it was impossible for them to execute efficiently, and than those others who still maintain them in a false position, and would, if report is to be trusted, even extend their sphere of action. Lord COKE says—

"If an office, either of the grant of the King or of subject, which concerns the administration, proceeding, or execution of justice, or the KING'S REVENUE,

or the commonwealth, or the interest, benefit, or safety of the subject, or the like ; if these, or any of them, be granted to a man that is unexpert, and hath no skill and science to exercise or execute the same, *the grant is verily void, and the party disabled by law*, and incapable to take the same *pro commodo regis et populi ;* for only men of skill, knowledge, and ability, to exercise the same, are capable of the same, to serve the King and his people."—*Co. Litt.*, 3.

If this be English law, we are anxious to learn whether no punishment can reach those who violate it.

Hitherto we have confined our remarks to the Royal forests, properly so called, not wishing to include within our observations any of the other branches of the subject. There will, however, be found in another column a letter from Mr. PALMER, of Nazing Park, which shows that we should be much deceived if we permitted ourselves to believe that neglect of Royal rights and mismanagement of Royal property were confined to those forests which are intended for the growth of navy timber. This gentleman assures us that the Commissioners of Woods have just issued a notice announcing their willingness to buy up the forestal rights of the Crown in Hainault (otherwise called Waltham) Forest, which rights have been usurped, either by the connivance or negligence of the Commissioners. It appears that lords of the adjoining manors, and other parties, have long been encroaching upon the forest, one plundering it of 10 acres, another of 50 acres, and so on ; that the verderers, (of whom Mr. PALMER is one, have done their utmost to stop the system, but unsuccessfully. By means of sham pleas the power of the verderers has been evaded, and cognizance of the encroachments has been transferred from their court to her Majesty's Attorney-General, who seems to have been instructed to take no notice of the verderers' presentments. This is quite consistent with the easy-going pace of the Treasury agents, who prefer here, as in other cases, letting unpleasant matters alone, to defending the rights and remote interests of the Crown, at a little trouble to themselves, or at the risk of offending some of the gentlemen "in Parliament and out of Parliament, in the Government and out of the Government," to whom Mr. WILSON referred so graphically in his official communications with Mr. KENNEDY. "There is no use in quarrelling, especially with lords of manors ; it is much better to let them squat and encroach, and acquire by possession some seeming rights ; for, after all, we can always buy them back again upon reasonable prices." Such appears, in this case, to have been the silent language of the Treasury.

QUOUSQUE TANDEM !

VEGETABLE PATHOLOGY.—No. XXVII.

122. THE reproduction of species is not the only object which is involved in the process of fructification ; their diffusion is scarcely of less importance or less clearly designed, and to this end means must be provided by which the reproductive bodies may be readily transported from place to place, and at the same time without injury. Some, therefore, are furnished with delicate feathers by which they may be wafted by the winds ; others are entangled in the fleeces of animals by means of hooked points, while others have a viscid adhesive coat. In the curious parasitic genus Myzodendron, the feathery processes of the achenium, which answer to the sarcocarp of Viscum, perform the double office of bearing the fruit to its destination, and by twining round the twigs after the manner of a tendril, fixing it firmly, in order that the protruding root of the germinating seed may be kept in its position, so as to acquire a firm adhesion and union with the matrix, one of the most curious and interesting adaptations of means to a particular end which is perhaps to be found in the vegetable world ; and further, as Dr. Hooker observes in his charming account of the genus, "the function performed by the gluten of the Viscum and the feathery setæ of Myzodendron is identical, though effected in a different way, and affords a singular instance of Nature's employing the same means in a very dissimilar manner to the attainment of the same end." In some cases the softer parts are inclosed in a thick shell capable of resisting the waves or outward elements, or the embryo itself is surrounded by hard horny matter, which is almost impenetrable. The surrounding tissues also contain matters favourable or unfavourable to decomposition, and thus, by reason of their various structure and constituents, they present the greatest diversity as to their comparative periods of vegetation, and the time during which they are capable of preserving their vegetative power uninjured. This power depends upon a variety of circumstances, but unless protected from the injurious effect of the external elements, few seeds are capable of vegetating after one or two years, while some, on the contrary, under ordinary circumstances, will retain their vitality for considerable periods, especially those of certain leguminous plants, or the hard seeds of different species of Canna.

123. Many seeds, however, if buried a certain depth within the earth, and thus removed from the influence of the oxygen contained in the air, will retain their vitality for several centuries, as appears not only from the fact of copious crops appearing where earth has been newly turned up from a depth exceeding that to which agricultural instruments usually penetrate, but from well authenticated instances of the vegetation of seeds taken from coffins or ancient barrows. But little credence is to be given to the assertions made of the vegetation of seeds taken from mummies, for the spices with which they are surrounded must speedily destroy all vegetation ; besides which, the tricks played by the Arabs upon incautious observers are matters of notoriety.

124. The period during which a seed is able to retain its vitality depends apparently on the power possessed by its constituent parts of resisting decomposition. The same seeds, therefore, under different circumstances, will exhibit very different phenomena. As a general rule, oily seeds exposed to the air retain their vitality for a comparatively short period, while those which contain abundant fecula, like cereals, will vegetate after a long period. Many seeds, however, which abound in oil, as those of Mustard and Poppy, will vegetate after a century or more when buried in the soil. All seeds do not acquire precisely the same degree of maturity, and many kinds which vegetate readily when only just ripe, germinate with difficulty when the tissues and integuments are hardened. One or two individuals only will frequently vegetate amongst a large number submitted to precisely the same treatment, but the remainder, though dormant for one or more seasons, at length germinate. It is extremely difficult, in consequence, to eradicate completely many species where the seed has once been shed. Eschscholtzia californica, for instance, will appear many years in succession, although not a plant is allowed to produce seed, or even flower. Were it not for such a provision one adverse season would often be sufficient to exterminate a species in any given locality. In some cases the tissues and their contents become so firmly compacted as to resist all ordinary conditions favourable to that degree of decomposition, without which germination cannot take place ; and it is therefore easy to conceive that cases may occur where over maturity may be no less injurious to crops produced from seeds where a speedy growth is indispensable than it is, as regards the tubers, in the case of the disease known by the name of curl to Potatoes.

125. Seeds depend in great measure for sustenance on the nutritive matter contained at a given time in the tissues, exactly as the formation of flower-buds is intimately connected with the condition of the tissues, however forcing or invigorating the matter may be which is freshly imbibed from the soil. Many seeds in consequence ripen perfectly, even when separated at a comparatively early period from their connection with the roots. This is notorious in the case of cereals, and of many garden seeds ; a very curious case, however, has lately been detailed in the *Gardeners' Chronicle*, 1854, p. 376, in which a number of perfect seeds were derived from the cut flowers of some prize Hollyhocks, and of the produce of which the ultimate development is now anxiously awaited.* *M. J. B.*

SALVIA SPLENDENS.

WHERE winter flowering plants are largely in demand for the decoration of the conservatory, or for supplying cut flowers, this will be found exceedingly useful ; for nice sized specimens are easily grown in the course of the summer ; they require very little attention or accommodation, and when seen in the form of large specimens, well covered with spikes of bright scarlet flowers, few winter blooming plants present a more brilliant appearance, and scarcely any remain so long in beauty.

Being a very rapid grower, it is unnecessary to keep old plants after flowering, except one or two to supply cuttings, for young plants occupy much less space in spring, and form large specimens in course of one summer. Cuttings should be put in not later than the middle of March, and afforded a gentle bottom-heat until they emit roots, when they should be potted singly in small pots. After potting place them in a close but not over warm situation, and as soon as they get established keep them near the glass, and afford them all the light possible, syringing over-head morning and evening in bright weather, and keeping the atmosphere as moist as circumstances will admit. If good sized specimens are wished by the autumn the young plants must not be allowed to suffer for want of pot room, but should be shifted as soon as the roots require more space, and unless this is attended to it will be difficult or nearly impossible to keep them dwarf and well furnished ; and if the plants are allowed to get into a pot-bound, starved condition, their great enemy, red spider, will also be sure to attack them. For soil, use equal parts turfy loam, leaf-soil, and thoroughly decomposed cow-dung, with a liberal admixture of sharp sand for the first potting, and a small proportion, with plenty of lumpy bits of charcoal, for the after shifts. This compost will rather incline to be close ; therefore, efficient drainage must be secured, and care must be exercised in watering not to get the soil sodden before the pots get filled with roots. As the plants advance in growth the shoots should be stopped and tied out, in order to secure bushy compact specimens ; but if a vigorous root action is maintained, there will be little difficulty in keeping the plants bushy. A cold frame or pit will be the best situation for them after the beginning of May, or earlier if the weather proves favourable ; but they should be kept close here, and not allowed to sustain any check, which at this stage would be very injurious. If all goes on well, the plants will be ready for shifting into good sized pots by the end of June, and I seldom repot them after this season. By this time they should be strong and well established in 8-inch pots, and when this is the case I shift some into 12, and others into 15-inch pots, according to the strength of the plants and the size it may be desirable to have them by the flowering season. They should be returned to the r former situation, kept close and moist, and encouraged to make active growth, merely giving sufficient air to keep the young wood strong. When the pots get well filled with roots, and the plants become good sized specimens, which will be the case by August, they should be gradually prepared for removal to a sheltered situation out of doors, where they will be shaded from the forenoon sun. Here they will make short stocky growth, and will flower more profusely than if kept under glass all the autumn, but they must not be rashly exposed to the sun, to dry and discolour the foliage. As to stopping, this should not be practised on plants intended to flower in November later than about the middle of August, and all the strong shoots should be stopped, otherwise the specimens will flower irregularly. If it should be desired, however, to retard the blooming of a portion of the plants, they may be stopped as late as October, but in this case it will be necessary to afford them a close place under glass until they make flowering wood. As soon as the weather becomes unsettled in autumn the plants must be placed under glass, for they are very easily injured by frost, and should be afforded a light airy situation. But if it should be desirable to have them in flower at once, they may be kept close and moist, and in this case they will soon be covered with their spikes of brilliant scarlet. If afforded a situation free from damp, and near the glass, with a temperature of about 45°, they will remain long in full beauty ; but large pot-bound specimens should be liberally supplied with manure water.

After flowering, the specimens may be thrown to the rubbish heap, reserving one or two to supply cuttings. These should be kept dry at the roots for a fortnight, then cut back rather closely, and placed in any spare corner of the greenhouse until towards the end of February, when they should be placed in a warm house, and thoroughly watered, when they will soon furnish a supply of cuttings. *Alpha.*

* Seeds ripened in this manner sometimes yield a weakly offspring. I have in my own garden a quantity of seedlings of a pink Horseshoe Pelargonium, the trusses of which were gathered when perfectly green and succulent. Many of the seedlings have perished from a sort of chlorosis, observable from the time of germination, and have been difficult to preserve.

DESCRIPTIONS OF NEW PEARS CULTIVATED BY M. DE LIRON D'AIROLES, AT LA CIVÉLIERE, NANTES.—BY HIMSELF.

(*Continued from p.* 420.)

Conseiller de la Cour.—Tree very vigorous and an abundant bearer, well adapted for a pyramid, the form which it naturally takes. Fruit very large, obovate, usually about 4¾ inches in height, and 12 inches in circumference. Stalk slender, woody, about ¾ of an inch or from that to an inch in length. Eye sunk and open, frequently without any remaining segments of the calyx. Skin pale green, dotted with russet, with which it is more closely covered near the stalk. Flesh white, fine, juicy, half buttery, with abundance of sugary and agreeably perfumed juice. Season, end of October and Nov. One of Van Mons' seedlings [and, according to the "Annales de Pomologie," it was named from the circumstance of his son being *Conseiller à la Cour d'Appel*, of Brussels. The tree bore for the first time about 1840].

Marie Parent.—Tree moderately vigorous. It first produced fruit in 1851. Fruit large, pyriform, with the surface uneven. Stalk oblique, ¾ of an inch in length, woody, and of a brown colour. Eye surrounded with folds in a rather large cavity. Skin green, changing to a golden yellow when the fruit becomes fit for use. Flesh white, very fine, melting, somewhat buttery, very juicy, sugary, and deliciously perfumed. Ripens in October. Raised by M. Bivort. [This sort is figured and described in the "Annales de Pomologie Belge," vol. i., p. 15. M. Bivort states that it was raised by him in 1844, and that the seed was taken from fruit gathered that year at Louvain, from a tree among the varieties resulting from the last generation of seedlings raised by Professor Van Mons, named in compliment to Madame Parent, wife of the editor of the "Annales de Pomologie."]

Bonne de la Chapelle.—Tree of moderate vigour, and apparently very productive. Fruit middle-sized, roundish, or rather Bergamot shaped, measuring 2½ inches from base to top, and 2¾ inches across. Stalk slender, and about an inch in length. Skin light green, glossy, irregularly sprinkled with small brown dots. Flesh white, crisp, juicy, sugary, and perfumed. Season, end of September. This sort was found by M. Jacques Jalais, gardener at Nantes, in the wood of La Chapelle-sur-Erdre, near Nantes, in 1845.

Beurré de Wetteren.—Tree vigorous, very thorny, suitable for a pyramid. Fruited for the first time in 1847. Fruit middle-sized, turbinate. Stalk about an inch in length, rather thick, slightly curved, with some small plaits round its insertion. Eye sunk in a wide evenly-formed cavity. Skin completely covered with russet, and slightly coloured next the sun. Flesh fine, yellowish-white, half-melting, buttery, with an abundant sugary, agreeably perfumed, musky juice. [In the "Annales de Pomologie," where this sort is figured and described, p. 59, it is stated to have been discovered by M. Louis Berkmans, in his garden at Heyst-op-den-Berg, among a number of wild Pear trees, which were

partly from his own sowings, and partly from those of the late Major Esperen, of Mechlin.]

Bon Gustave.—Tree vigorous, suitable for a pyramid. Fruit middle-sized, 3½ inches in length, and 12 inches in circumference, of a regular pyriform shape. Stalk nearly an inch in length, thick and woody. Eye shallow and open. Ground-colour of the skin light green; but nearly the whole surface is russeted. Flesh white, fine, buttery, with a sugary perfumed juice. A fruit of first-rate quality, ripening in December and January.

ON THE DISEASE OF HARICOTS, LETTUCES, AND MELONS.

By M. Bazin.

It has been remarked for the last few days past that the leaves of the Haricot Bean, forward enough to have a few ripe pods, have been disfigured by patches of a yellowish colour, and that when the spots and leaves attacked have become tolerably numerous, the plants have begun to languish, and have become seriously out of health. No one has known to what to attribute this morbid affection. Seeing it daily increase I examined it with care, and soon found that the ravages were caused by a multitude of small jumping insects, which devoured the parenchyma of the upper surface of the leaves, and hid themselves under the lower surface, being entirely covered by their excretions.

In order to arrive at a satisfactory conclusion, I put some of the insects in a glass tube, into which I also placed some pieces of perfectly healthy leaves, and I soon saw that the leaves were attacked and reduced to the same condition as those of the frames. The insect not only eats the parenchyma, but poisons the leaf, and renders it unfit for the performance of its respiratory functions; the plant then suffers, and would, no doubt, ultimately die if, in consequence of the active influence of a forced vegetation, new leaves did not incessantly replace those attacked.

The green Haricots of 1854 are in ill health, and that is due, as is clear, to the ravages of an insect, as far as has been at present ascertained. The insect, unknown at present, is hemipterous and monopterous, nearly allied to the bugs of the sub-genus Miris.

Since the leaves of new Lettuces and Melons just appearing above ground were spotted in a similar manner as, indeed, was seen in the case of Melons and Gourds last year, I turned my attention to them, and found these leaves also infested by the same insect.

It may be remembered that, two years ago, MM. Charles and Stephane Bazin discovered, on the leaves of diseased Potatoes, insects of the genus Podura, which hid themselves in the day-time, and only ran about at night, and which seemed to be, by their ravages, the proximate cause of the well-known disease.

The malady from which the leaves of the Haricot are suffering is apparently so like that which afflicts the vineyards, that there seems to be some reason to suppose that those observers are right who attribute the Vine disease also to the devastations of insects. *Comptes Rendus.* [We print this for what it is worth: without at all endorsing the author's opinions.]

TRADE MEMORANDA.

Who is Mr. George Baron, of Harley Street, Blackburn?

Home Correspondence.

Waltham Forest.—I was very glad to see, by the remarks you made in your Paper of the 24th inst. upon the correspondence between Mr. Kennedy and Lord John Russell, and the general observations upon the manner in which the management of her Majesty's Woods and Forests is being transacted, that you take some interest in those affairs. As one of the verderers of Waltham Forest, I have been trying for some years past to check the abuses and encroachments upon the rights of the Crown and poorer foresters which have been enacted to a great amount by some of the stewards of the lords of manors upon the forest, but have received no support from either the Lords of the Treasury or the Commissioners of Woods and Forests. The forest keepers have also been anxious to do their duty, and have regularly presented the encroachments that have taken place, some of them by the lords of manors themselves, of plots of land from 10 to 50 acres in the very heart of the forest; and then, when these encroachments have been brought before the verderers, at their Court of Attachments, they have pleaded, through their agents, *that the land in question was not within her Majesty's forest of Waltham*—which pleading under the act of Parliament (10 Geo. 4, cap. 50, clause 100) prevented the verderers from proceeding to judgment, but required them merely to certify the pleading of the parties who had made the encroachments to her Majesty's Attorney-General, who, doubtless in pursuance of instructions from *some one*, has taken no further notice thereof, thereby encouraging other parties to make further encroachments upon the rights of the Crown and the poorer foresters. A notice has just been issued from the office of Woods to the effect that the Commissioners are ready to receive proposals to purchase the forestal rights of the Crown upon reasonable prices from those persons who have made these encroachments in ignorance; whereas it is well known they have been all wilful acts, and in many instances the encroachments have been protested against at the time of being made, by the freeholders and poorer foresters, thus causing the Crown to desert these poorer foresters, who have ever looked up to the Crown to aid and support them in maintaining their rights of pasturage for their cattle, &c. at the same time that the feed and protection of her Majesty's deer were regarded—a measure, in my opinion, most unworthy of any responsible adviser of her Majesty to pursue. *George Palmer, Verderer of Waltham Forest, Nazing Park, Waltham Cross, June* 29, 1854.

Caterpillars.—When passing a market garden in this neighbourhood yesterday, my attention was attracted to the singular appearance presented by a large plantation of Gooseberry bushes, loaded with fine fruit, but wholly destitute of leaves. I at first supposed it to be the effect of some disease, resulting from the long continuance of cold unseasonable weather, and the dry blighting winds that prevailed during the past month; but on inspection I found it to be the work of myriads of caterpillars, which made their appearance, as I was informed, about 10 days ago, and in that short period committed all this destruction. It is not unusual to see in our best managed gardens a few bushes disfigured in the early part of the season, but immediately the pest is discovered means are taken to check or arrest its progress. In this instance, however, nothing of the sort had been done, nor does it appear that the parties interested had the least suspicion of their property being molested by such a formidable enemy, until the latter had nearly accomplished its work, and rendered all applications unavailing; and the consequence is, that from the bushes being as bare of leaves as they are in winter, they will naturally receive a certain amount of injury, but not by any means to be compared with that of the crop, which I should imagine will be almost worthless. I regret to say that the ravages of the caterpillar are not confined to any one plantation or locality, but appear to be general on the west side of London, and I dare say will be noticed by some of your correspondents, should any of them have had the misfortune to be visited with this destructive pest. *W. B. Booth, July* 3.

Effects of the late Winter and Spring on hilly ground.—As a confirmation of the well-known fact, that frost is often much less severely felt on the hills than on the neighbouring plains, I beg to annex a list of shrubs, &c., which, in the county of Surrey (about 500 feet above the sea), have been in no degree injured by the severity of the late winter and spring, viz., Cupressus funebris, C. thurifera, C. Lambertiana, Pinus insignis, P. Hartwegi, P. Montezumæ, P. palustris, Abies Douglasi, A. Webbiana, Araucaria, Deodar, Ilex, common Arbutus, Bay, Laurustinus, Hydrangea, and Escallonia. Azaleas have flowered poorly, but are not at all cut by the frost; Cunninghami is slightly browned, but the leading shoots are not at all damaged; unprotected Apricots and Greengages are a good crop. The only trees which seem to have suffered are Peaches and common Robinias. *P. P. P.*

Hartley's Rough Plate Glass.—I am about to erect, over one of Mr. Rivers' Peach frames, which has proved a failure, a span-roofed Peach-house, 90 feet by 18 feet, the roof to be fixed, and ventilation to be effected by the side lights. As Peaches always colour the best when the lights can be entirely removed on fine days, it had occurred to me that possibly they might not colour so well under a fixed rough plate glass roof; I should, therefore, be glad if any of your correspondents, who have had experience in the matter, would favour me with their opinion. In the Orchard-house at Basing Park the Peaches, &c., colour beautifully under common sheet glass, and I must confess I know no reason why they should not, under rough plate; still, I should not like to pay an extra price for my "whistle" and then find it to be of no use. *W. P. A., South Wales.*

Aëration. — The system proposed by your correspondent "J. P. S.," Chesterfield, seems very important. The principle is not new, but practically it has been but imperfectly understood. If "J. P. S." would take the trouble to furnish an exact description, with a sketch, of the ventilator in use, it would confer a great favour on many parties in this quarter, and probably on your readers generally. *H. A., Glasgow.*

Effects of the Winter and Spring on the Pinetum at Bicton, Devonshire.—With us, last winter was the most severe we have had for these 14 years past. Throughout January the thermometer indicated from 8° to 17° of frost, accompanied by cutting north and north-easterly winds. No very serious injury was then done to the plants. The nights of March and April were frosty, the thermometer showing, on many mornings at sun-rise, from 6° to 10°. The sun rising brightly and shining fiercely on the thick hoar-frost began to sear and rust many plants; but it was on the two last weeks in April the most serious injury was done here, after the sap was pretty well up, and many plants had been excited into free growth. We had then from 6° to 9°, and even 10° of frost one morning at sun-rise. Plants, however, which at the time showed the ill-effects of the hard weather have now completely recovered, and are making very luxuriant growth. Taxus Harringtoni, T. Mackaii, T. Bariensis, and T. elegantissima have stood uninjured; Phyllocladus trichomanoides and asplenifolius, which had been slightly protected, are not injured in the least; Saxe-Gothæa conspicua promises to prove as hardy as any of the Yews; Cephalotaxus Fortuni has not been injured; Podocarpus Purdiana and mucronata have been killed, but totara, slightly protected, is unhurt; Dacrydium Mayi, protected, is uninjured. A few of the Mexican Pines have been entirely killed, such as P. occidentalis, P. Grenvilleæ, P. Gordoniana, P. longifolia, and P. filifolia. These measured from 1 to 2 feet in height, and were protected with a small box asphalte protector, with dry Fern placed round their stems, and kept close in severe weather; larger specimens, however, have not been injured in the least, such as P. oocarpa, 14 feet high; P. Russeliana, 10 feet high; P. Hartwegi, of similar height; P. teocote, 16 feet in height, with branches 20 feet in diameter; P. leiophylla, 20 feet in height, and branches 20 feet in diameter—these kinds, as I have stated, have not suffered, and are all making fine wood; P. patula, 8 feet in height, has had a very rusty appearance, but it is now making shoots from 6 inches to 1 foot in length. Pinus californica appears to be quite as hardy as P. insignis, and it has the appearance of making a more noble tree; it is 25 feet in height, with branches 20 feet in diameter, and has no fewer than 100 cones upon it, which have a singular appearance, being formed in whorls on the young wood. Pinus insignis is a fine specimen, having attained the height of 50 feet, while the diameter of the branches is 40 feet, and the circumference of the stem, at 3 feet from the ground, is 6 feet 3 inches; when planted out, in 1839, it was from 8 to 10 feet in height; the annual rate of growth has been 2 feet 8 inches; it has several times lost its leader, which has been eaten off by beetles or broken by birds alighting upon it when very young. This Pine does not appear to bear cones so freely as P. californica, and it is not so large. Pinus macrocarpa is another fine specimen, 46 feet in height, with branches 37 feet in diameter; its mode of growth is singular—from the root to half the height of the tree the branches twist one across the other, while the top part grows more erect. The circumference of the stem at 3 feet from the ground is 5 feet 6 inches. This tree has not produced cones, but it is annually covered with male catkins. A few small specimens of Abies have been injured by the spring frost, such as A. morinda, A. Brunoniana, A. Khutrow, and A. Smithiana; these were not more than 2 feet in height, whereas specimens of A. Smithiana, from 18 to 20 feet in height, have not suffered in the least. A. Douglasi is here a very spreading tree, having lost its leader several times; it is 45 feet in height; the diameter of the branches is 40 feet; and the circumference of the stem at 3 feet from the ground, 5 feet; it bears great quantities of cones, which, owing to their great weight, often strip off the branches, but they never produce seed, on account of the spring frosts destroying the male catkins, which are produced, like those of many other varieties of Abies and Pinus, in February and March. The Yew-leaved variety of Douglas Fir (Abies Douglasi taxifolia) is 31 feet in height, while the diameter of the branches is 32 feet. Abies Menziesi is one of the finest of the species of Abies; when moved by the wind, with the sun shining upon it, it has a remarkable appearance, on account of its silvery foliage; it is 32 feet in height, with branches 22 feet in diameter. Of Piceas many have been injured by the spring frost destroying their young shoots when 1 or 2 inches in length, such as those of P. pichta, P. pindrow, and P. naphtha. On former seasons P. Webbiana, in a young state, was greatly injured by late frost; but now that it is 27 feet in height, it does not get injured in the least; the diameter of its branches is 16 feet, and the circumference of the stem 3 feet 2 inches. The long silvery foliage and large blue cones growing among the branches give this tree a fine appearance. It has not yet produced any seed, on account of the spring frost destroying all the male catkins. P. nobilis is 16 feet in height; it is a fine tree, with singular-looking cones. P. Nordmanniana has the appearance of making a noble tree, having attained the height of 9 feet in a short time. P. cephalonica is another species that has generally been injured by late frosts, but now, when it is 28 feet in height, it does not suffer in the least; the diameter of its branches is 21 feet, and the circumference of the stem 4 feet. P. pinsapo is 10 feet in height, and appears more hardy than cephalonica in resisting spring frost. Cedrus Deodara is 35 feet in height, and the diameter of the branches is 34 feet. Araucaria imbricata is a fine tree with a luxuriant dark colour, and branched to the soil; it is 24 feet in height, the diameter of the branches is 16 feet, and the circumference of the stem 3 feet 3 inches. This tree was moved a considerable distance, with a large ball of earth attached to it, in the year 1847, which of course retarded its growth for a season or two. Several years previous to its removal it had formed cones, and it has continued to produce them yearly in quantities, and of a large size. Seed of course it has not perfected, having had no male catkins. This season a fine healthy male Araucaria imbricata, 16 feet in height, has produced its curious long brown coloured catkins or cones. To us they have a novel appearance. There is an avenue here through one of the parks of these singular trees in a very healthy vigorous condition, averaging 15 or 16 feet in height. We may therefore expect to see, ere long, more males, with catkins or cones. Araucaria Braziliensis has stood out with us several winters, and had grown to 8 feet in height, but this winter has killed it. Cunninghamia sinensis is 18 feet in height; all the lower part of the tree had a very brown appearance, but it is now making young wood, and is assuming its usual green appearance. Cryptomeria japonica is a fast growing tree, having been planted about seven years ago, and now it is 20 feet in height, and has been full of cones for several seasons. Taxodium sempervirens, planted at the same time, has grown to 20 feet in height, with branches 16 feet in diameter, and not the least injured by the late winter. Callitris australis was 16 feet in height, but it has been killed, although it has stood for many years uninjured; Callitris macrostachya and C. cupressiformis are

unhurt. Dammara australis has been nearly killed, and there does not appear to be any chance of this plant standing even the climate of Devonshire. Fitz-Roya patagonica will doubtless prove to be as hardy as any of the Cedars, having, with a slight protection, remained uninjured. Cupressus juniperoides and C. aurea have been killed. C. lusitanica, 20 feet high; C. Uhdeana, same height; C. Lambertiana, 12 feet high; C. religiosa, 15 feet high, and C. torulosa, 24 feet high, have all a grand appearance, and have stood quite uninjured; C. macrocarpa is the most striking species of all, and on drawing a branch of it through the hand it emits a most beautiful odour; it is a fast growing tree, having attained the height of 15 feet in six years. Juniperus oxycedrus, echiniformis, communis, and canadensis have been killed. The following have not been injured:—Juniperus mexicana, J. Chamberlani, J. alba, sp., J. flagelliformis, J. oblonga, pendula, J. depressa, J. Bedfordiana, J. fragrans, J. flaccida, J. recurva, J. humilis, J. uvifera and J. rependa; these are now beginning to have a grand appearance. Thuja pendula is a remarkable looking specimen 10 feet in height, with drooping branches reaching nearly to the ground; T. japonica, T. Warreana, T. orientalis stricta, are fine-looking specimens from 10 to 15 feet in height. *James Barnes.*

Protection of Wall-fruit.—I hope you will pardon my again directing attention to this subject. One of our Apricot walls is flanked by an east wall, upon which is the cover represented at p. 389; next the Apricot wall is planted a red Magnum Bonum Plum; one branch of this Plum has extended itself, and taken advantage of the canopy or covering of the Apricot, and is covered with abundance of fine fruit, whereas the rest of the tree has not a single Plum on it. This, I think, forcibly shows the good effects of such shelter, and what might be effected if in general practice. *W. B. M. Lisle, LL.D., St. Fagan, Cardiff.*

Wasps.—The following were destroyed at Copt Hewick in 1854, and paid for to children who brought them,

M., Copt Hewick Hall, June 29.

Kennington Park.—The most remarkable feature connected with this park at present is the amount of bare earth which it contains; for, although the boundary belts on the east and south sides have been all planted, yet such is the naked nature of the trees and shrubs that have been put into them that, standing at the model cottage and taking a general survey of the whole, scarcely a green leaf can be seen. The greater portion of the centre will, I understand, be Grass; but, although the season is so far advanced, not a seed has as yet apparently been sown. The walks, which are for the most part straight, with the exception of an extremely ugly and crooked one (serpentine it certainly cannot be called) on the south side, are about 15 feet wide. They have gratings here and there along their sides for carrying off surface water; but so unlevel are the walks that in many places the water never reaches these, but after a shower stands in pools along their sides, and the whole surface of the gravel is a puddle. As regards the borders, they are wholly planted with trees and shrubs such as no man with the slightest knowledge of gardening would ever think of planting, even if he got them for nothing, and which respectable nurserymen would be obliged to send to the faggot heap. Such as are growing will not make any appearance for years, which will be quite intelligible when it is stated that the largest of the forest trees (consisting of Beech, Birch, Elm, Lime, Oaks, and Poplars, &c.), is about 12 feet high, with very few short side branches, and about 2 inches in diameter at the ground. The shrubs, which consist for the most part of Box, Alaternus, Arbor-vitæ, Lilacs, Aucubas, and a few Laurels, which are nearly all cut down to the ground, exhibit the same miserable appearance, fully bearing out what has been said respecting the general naked appearance of the place, and which, except fresh shrubs and trees are introduced, it must have for years. Even the planting of these wretched materials has been done in the most unskilful manner. I observed five Arbor-vitæs in about 2 yards square, and seven Beeches in as many square yards, which are only two instances of very many in which the shrubs and trees are thus huddled together; and although the borders are wide, yet Arbor-vitæs and Alaternus are planted within 18 inches of the Grass verge, and at one place a Hornbeam was even placed at one foot from the verge! Deaths have taken place in abundance. In one place we remarked 12 plants dead, or cut down to the ground, in as many square yards. The only shrubs in the place at all passable are a few Rhododendrons, planted round the model cottage. These look healthy and well, indicating that the place is not unfavourable to growth. The paucity of trees of an ornamental character is a point worthy of notice. There are only one or two purple Beeches, no evergreen Oaks, and no Chestnuts or Almonds. There are certainly a few standard Thorns and Laburnums; but these are planted far back in the borders. I also remarked a Weeping Ash or two; but little else. A few Gueldres Roses, pillar Roses, and hardy Azaleas unworthy of the name may be found here and there. Some of the latter, as well as forest trees, are now laid in by the heels, which I should think will be none the better for the summer treatment they have received. *A Gardener and Looker-on.*

Slugs.—A hint given a week or two ago by one of your correspondents on the capture of slugs seems worthy of republication. To put it into a methodical form:—Take a basinful of oatmeal, and an iron spoon, and sally forth about 6 o'clock, P.M., after rain. Drop a patch of meal, not on the open border, but near any little assemblage of leaves or stalks that offers a nidus to the vermin. A Strawberry bed is a regular preserve. The basin emptied, put in a little salt and water, and with spoon in hand revisit your deposits about an hour later; and you will witness such a commotion amongst a family not noted for agility as will astonish you. Slugs old and young, wrinkled slugs and smooth, black and brown, yellow and grey, mottled and drab, are all on the move. The spectacle of a dozen Russian store-ships could not produce a greater stir amongst the Baltic fleet. Some are seen bearing down in full sail towards the treasure, some tacking to get advantage of the wind, some with grappling-irons fixed intent only on plunder, and some, it may be, reluctantly turning aside, having shipped a cargo far heavier than prudence would dictate. If some friendly chemist would suggest a little addition to the Oatmeal, which would serve as a quietus without the spoon and salt, the recipe would be complete. *T.*

Rain Gauges.—Your correspondent, Mr. Slatter, thinks that the observations made at Pembroke Dockyard, of the differences in the amount of rain between my two gauges betray "internal evidence of error." I shall be much obliged to him to point out that evidence, as it may, if discovered, assist in arriving at a correct understanding of the question. *T. S. P., Bowness, Windermere, July* 3.

Potato Disease in Ireland.—It is now, I think, over two months since I showed unmistakeable signs of this disease to a learned botanist in Cork; and in a day or two after to two botanists in Dublin. Neither of them believed me, at least so I thought. I showed the same to another and a more learned philosopher, who does not profess or pretend to be a botanist — he did believe me. I have closely observed the growing crops in very many parts of Ireland ever since, and still remarked the same symptoms. A few days ago I saw, within the circular road, Dublin, the leaves and stalks actually withered from disease. Since then I have seen the same, varied in extent, in all sorts of places, from the flat fertile lands in Fingal to the highest bog farms in Tipperary and Clare. I have, since I came to this hotel, seen the disease in the very hearts of the tubers served up for dinner; yet few will believe in its existence. To what extent the disease will go I believe no one can even guess with any degree of accuracy. The past three weeks in Ireland have been very favourable to its spread. This much I know, and all should know the same, that, taking into account the deficiency in our early meadows, and the chances of a bad quality of hay in our late ones, the probable lightness of straw in our grain crops, the high prices at which beef and mutton are selling and likely to sell, every available spot should be sown with the late varieties of Turnip, Rape, in drills and broadcast, and transplanted in the autumn, with the view of securing a fair share of winter and spring provender, generally scarce in most parts of Ireland, but more particularly so during and after severe winters. Such our last winter was and our next may be. "A word to the wise is sufficient for them," and those who will not be wise in time, when fore-warned is being fore-armed, will have themselves alone to blame. *Edward Carroll, Clare Hotel, Limerick, July* 5.

Societies.

ROYAL BOTANIC, REGENT'S PARK, *July* 5.—This Society's last *fête* of the season took place on this occasion under very unfavourable circumstances as respects weather, heavy showers falling at short intervals during the whole afternoon. The exhibition itself, although we observed some of the recesses and other portions of the benches filled with plants from the Society's houses, may, on the whole, be pronounced a good one for July. Stove and greenhouse plants were produced in tolerable abundance, Orchids were in good condition and pretty plentifully supplied, and there was a fair proportion of Pelargoniums and other florists' flowers. Fruit was plentiful and good.

Of 16 STOVE and GREENHOUSE PLANTS, we remarked exhibitions from Messrs. May (gr. to H. Colyer, Esq.), Speed, and Green; all of which did these growers great credit, their plants being clean, fresh looking, and well flowered. Among Mr. Colyer's we remarked very fine specimens of Erica metulæflora bicolor and E. Parmentieri rosea. These were both unusually brilliant and handsome. The same gentleman had also two Vincas, and a similar number of Ixoras, all good; a Rondeletia, and excellent plants of Phænocoma proliferum and Polygala oppositifolia. The other groups also contained many remarkable specimens, but we need not stop to particularise them here, as they will doubtless be reproduced at Chiswick to-day, when they will be carefully examined and fully reported on next week. The same remark also applies to other collections of stove and greenhouse plants from Messrs. Fraser, Rollisson, Pamplin, Gilham, Barter, Peed, Clarke, Jarvis, Hamp, Taylor, Over, Rhodes, and Roser. In a group from Mr. Frost, gr. to E. L. Betts, Esq., which was first in collections of 10 plants, were excellent examples of Kalosanthes miniata and coccinea, Dipladenia splendens and crassinoda, and a very fine Allamanda. Miss Traill's gr. (Williams) had also an excellent Tetratheca verticillata, a good Pimelea decussata, and a handsome plant of the large-blossomed Erica Shannoni.

ORCHIDS, as we have stated, were well furnished by their usual exhibitors, Messrs. Williams, Woolley, Rollisson, Hume, Gedney, Ivison, Clarke, Keele, Green, and Summerfield. Mr. Hume's plants were not so fine this time as they were last, and they were certainly too much surrounded by sticks to be either natural looking or graceful. Among them were Aerides quinquevulnera in fair condition, a good Miltonia spectabilis, and handsome specimens of Phalænopsis and Saccolabium Blumei. Mr. Gedney's most remarkable plants were Phaius albus, Oncidium Lanceanum, Phalænopsis, and Lælia anceps. Mr. Keele had the same new Brassavola which was shown at the last meeting of the Horticultural Society in Regent Street.

CAPE HEATHS were plentiful and well varied, many of the autumn flowering kinds differing greatly from one another, not only in habit of plant, size, and shape of flower, but also in colour. They, therefore, received more than usual attention.

ROSES this time were all shown in a cut state. They were produced by the usual exhibitors, and in good condition; but being arranged along the low side shelves of the great conservatory, they were not seen to good advantage.

Of NOVELTY there was again but little. Messrs. Henderson, of Pine-apple Place, sent the yellow-flowered, handsome-leaved Begonia xanthina, Cheiranthera linearis, Tropæolum incisum, a promising kind; Scutellaria pulchella, and a variegated Fuchsia. Messrs. E. G. Henderson, St. John's Wood, had a collection of Gloxinias and Achimenes, some of which, viz., G. erecta magnifica, and A. Sir Trecherne Thomas, were good; also Echites Pellieri, which was, however, scarcely sufficiently in flower to judge of its merit. Messrs. Veitch produced a large and fine plant of Veronica variegata, a singular-looking small-flowered Cyenoches, and Ixora Lobbi; and Messrs. Standish and Noble again showed their handsome Clematis lanuginosa, and a group of Berberis and other plants. Messrs. Rollisson had Abelia uniflora, a species of little beauty; and Scheeria mexicana came from Mr. Parsons. Mr. Gedney had a large and fine Nepenthes Rafflesiana, which was not, however, shown as a new plant.

PELARGONIUMS.—Mr. Turner obtained the first prize in the Nurserymen's Class, with Magnet, Mochanna, Rowena, Carlos, Enchantress, Optimum, Ganymede, Governor-General, Juliet, Achilles, Azim, and Zeno. Mr. Gaines, who was second, had Queen of Purples, Electra, Nandee, Beauty of Montpelier, Governor, Ajax, Fête noir, Lady Julia, Advancer, Arethusa, Rosa, Seraph, and Andover. Amateurs:—1st, Mr. Holder, with Carlos, Alonza, Pearl, Mochanna, Optimum, Ajax, Supreme, Narcissus, Boule de Feu, and Magnet; 2d, Mr. Robinson. FANCIES:—1st, Mr. Turner, with Electra, Caliban, Celestial, Erubescens, Conspicuum, and Criterion; 2d, Mr. Gaines, with Conspicuum, Delicatum, Vandyke, Alice Maude, Advancer, and Perfection. Amateurs: 1st, Mr. Robinson, with pretty plants of Emily, Delicatum, Fairy Queen, Celestial, and Roland Cashel; 2d, Mr. Winsor, with Magnificum, Duchesse d'Aumale, Parodi, Statuiski, Fairy Queen, and Prince Albert. New Varieties: 1st, Mr. Turner, with Governor-general, Carlos, Mary, Eugenia (a charming spotted kind), and Foster's Rosa; 2d, Mr. Holder, with Pilot, Portia, Sanspareil, Basilisk, Governor-general, and Medora. Mr. Turner received a prize for a large and fine plant of Rowena in an 8-inch pot, shown as a specimen. The same nurseryman also received a Certificate for Pelargonium Una, a fine kind with large trusses and good habit. Phaeton was shown again, and Mr. Gaines reproduced Conqueror. He had also a group of his French Pelargoniums. Mr. Edwards showed a group of well-managed Scarlets.

FUCHSIAS.—Mr. Bray had Elizabeth, Perfection, Speciosa, Madame Sontag, Pearl of England, and Collegian. These were well-flowered and beautiful plants, most of them being about 7 feet in height, and well furnished with branches from top to bottom. Mr. Ward sent Prince Arthur, Elizabeth, Pearl of England, Sir J. Falstaff, and Glory.

CALCEOLARIAS.—Six nicely-flowered plants came from Messrs. Henderson, of Pine Apple Place, they consisted of Othello, President, Minerva, Bertha, Ophelia, and Rubens. Of seedlings, by far the best was one called Eclipse, from Mr. Cole, which must doubtless prove a favourite, being brilliant in colour, and apparently a very free bloomer.

PANSIES were shown tolerably numerous and good, but not sufficiently fine or dissimilar from those shown in May and June to call for special notice. The prizes were awarded to Mr. Turner, Mr. Bragg, and Mr. Bryan, in the order in which the names are given.

We observed stands of CARNATIONS and PICOTEES shown by Mr. Turner, which received prizes, and were interesting at this early time of the year.

There were several lots of cut VERBENAS, and some plants of seedlings, the best of which was Wonderful, purple, with a large white eye; this had a Certificate. Lady Lucan is also a very pleasing rose, with large yellow centre. In the cut collections, Boule de Feu and Willam Barnes were the best for effect. There were some pretty light kinds; Bridesmaid and Madame de Freleuse were very good.

PINKS.—Fine stands were staged in the Nurserymen's Class of 24 blooms. Mr. C. Turner was 1st, with Brunette, Teddington, Richard Andrews, Duke of Devonshire, Harry, Jupiter, James Hogg, Climax, R. Smith, Arthur, Optima, Sarah, Lord Valentia, Fanny, Mrs. Hoyle, President, Constance, Criterion, New Criterion, Adonis, Salt Hill Rival, Perfection, John Stevens, and two Seedlings: 2d, Mr. J. Keynes, with the following, dissimilar to those in the first collection, Great Britain, Lord C. Wellesley, Sappho, Lola Montez, Mrs. Lewis, Narborough Buck, Koh-i-noor, Lady Mildmay, Ada, Edwards' No. 9, King of Purples, Huntsman, Ruby, Mrs. Judd, and Napoleon. Mr. Bragg was 3d, with the following, not in the two first stands, Mrs. Bragg, Duke of Wellington, Prince of Wales, Goliath, J. Dickson, Lady B. Smyth, Eliza, and Desdemona. In the 12 class for Amateurs, Mr. Baker, Woolwich, was 1st, with Arthur, Optima, Sarah, Warhawk, Constance, Mrs. Wolf, Criterion, Harkforward, Sappho, Koh-i-noor, Mrs. Norman, and Colchester Cardinal; 2d, Mr. Lawrence, Hampton. Several seedlings were exhibited; the best were R. Andrews, Adonis, and Field Marshal.

FRUIT, as we have stated, was abundant and good. The best collection was furnished by Mr. M'Ewen, gr.

to the Duke of Norfolk, at Arundel. It consisted of three capital bunches of Black Hamburgh Grapes, four Melons, two dishes of very good Green-gage Plums, Bigarreau and Late Duke Cherries; Royal George and Red Magdalen Peaches, and Elruge Nectarines, and Trollope's Victoria and other Strawberries. Mr. Fleming, gr. to the Duke of Sutherland, at Trentham, and Mr. Spencer, gr. to the Marquess of Lansdowne, also had collections, of which there were altogether five

Pine Apples were numerous, but not remarkable for great weights. They consisted, for the most part, of Queens and Providences, good examples of which were furnished by Messrs. Bailey, Robinson, Bray, Thomson, Bore, and Davis. The best Queen again came from Mr. James, gr. Pontypool Park, and Mr. Jones and Mr. Spencer both had good fruit of this variety. Mr. Robinson sent the best Providence.

Grapes were extremely numerous, and very good. The best Black Hamburghs by far came from Viscount Dillon's gr. (Boyd). These were large both in bunch and berry, finely coloured, and covered with a most beautiful bloom. The same grower had also some of the best Muscats that were perhaps ever seen, as far as size was concerned, the berries being nearly as large as Plums; they did not, however, appear to be quite ripe. Most excellent Black Hamburghs were furnished by Mr. Frost, gr. to E. L. Betts, Esq., Mr. Wood, Mr. Stent, Mr. Hughes, Mr. Hill, Mr. Bailey, Mr. Thomson, and Mr. Mitchell, and Muscats by Messrs. Solomon and Turnbull. The best Muscadines came from Mr. Williams and Mr. Tillyard. Mr. Ivsion and Mr. Constantine both had Grapes in pots, those from Syon very good.

Peaches and Nectarines were unusually plentiful and good. The best came from Mr. Snow, gr. to the Earl de Grey. They consisted of Noblesse Peach and Violet Hative Nectarine. These were large, well coloured, and altogether very fine. Mr. Cowan had also beautiful Royal George Peaches and Violet Hative Nectarines. Mr. Brown sent large and fine Royal George Peaches, and tolerably good Violet Hative Nectarines. Mr. Chapman, gr. to J. B. Glegg, Esq., had excellent specimens of Violet Hative Nectarines, and Noblesse and Bellegarde Peaches. Mr. Spencer produced some very fine Noblesse and Bellegarde Peaches, and Violet Hative and Elruge Nectarines; Downton and Elruge Nectarines, and early Purple and Bellegarde Peaches came from Mr. Turnbull.

Of Apricots, there was a dish of small fruit, said to have been ripened without fire heat, from Mr. Allport.

Plums.—Mr. M'Ewen sent a dish of Green-gage, and another of some black Plum came from Mr. Tillyard.

Of Figs, Mr. Snow showed good fruit of Lee's Perpetual.

Cherries.—The last-named exhibitor had some good Eltons and Black Tartarians; Mr. Spencer sent good fruit of Bigarreau.

Among Melons, one of the best was a Beechwood from Mr. Whiting, of the Deepden, near Dorking. Mr. Frost had also a good green-fleshed; and Victory of Bath from Mr. Lidyard was considered good, as was also Munro's Egyptian Hybrid; Mr. May was awarded a prize for the Hoosainee.

Among Strawberries, we remarked a good-looking seedling called Omer Pacha, which was said to be well flavoured. We also noticed a dish of the White Bicton Pine. The more common kinds were abundant and very good, especially some from Mr. Lidyard, of Bath.

Some tropical fruit was shown by Mr. Ivison, of Syon.

Notices of Books.

Dr. Robertson's Handbook to the Peak of Derbyshire (Bradbury and Evans), is intended for the information of visitors to Buxton, who, we have no doubt, will find it an agreeable as well as useful companion. It gives a good geological account of the district, historical records of baths, and numerous details relating to the neighbourhood, to which is added some botanical information, which many will find acceptable, since it guides them to the spots where the wild flowers peculiar to the Peak can be easily found.

Mr. Budworth Sharp has circulated some *Observations upon Fibrous Substances*, by way of introduction to Dr. Royle's lecture upon the subject, lately delivered before the Society of Arts. No one possesses more practical knowledge of this important subject than Mr. Sharp, from whom we must borrow what follows, however much we may shock the susceptibilities of our politico-economical friends:—

"I am sorry that the documents in my possession do not enable me to give an uninterrupted statement of the importation of flax and hemp for each year of the present century, which might have been desirable. But information of that nature will appear in the course of a few weeks, as I have placed in the hands of an honourable member the heads of two motions for Parliamentary returns—one showing the importation of flax and hemp in each year, from 1801 to 1853, distinguishing that imported from Russia; the other showing the import and export of rags in the same years. When these returns are made, they will, I expect, prove that the opinion which I have elsewhere hazarded—namely, that we have paid Russia in the last year between four and five millions, and within the present century nearly 100 millions sterling, for flax and hemp alone—is not far wide of the truth. It is an anomaly little creditable to the enterprise of Englishmen that the sails and rigging of the ships, and a portion of the clothing of the seamen, of our splendid fleets in the Baltic and the Black Sea should be composed, in a considerable degree, of the produce of the soil of that country whose coasts they are now blockading; thus giving extensive employment to the Russian peasantry, and enriching the nobles of Russia, when (and I make the assertion most advisedly) every pound of the same materials, or others of equal value, could have been obtained, for the last hundred years, from our own possessions, east and west, within the tropics—giving a corresponding amount of employment to our own fellow-subjects, and conducing largely to individual, colonial, and national benefit. It is time that this were done. Nor will it be the fault of the individual who appends his name to these observations if, in the sphere in which he moves, aided by effective patent machinery, he does not entitle himself to the credit of having contributed his full share to the realisation of those advantages, public and private, with reference to this question, which it is quite within our power to accomplish."

New Plants.

67. Spiræa grandiflora, *Hooker in Bot. Mag., t.* 4795; *aliàs* Amelanchier racemosa, *Lindl. in Bot. Reg.*, 1847, *sub. t.* 38.

A very remarkable hardy shrub, found by Mr. Fortune in the North of China, and sent home as an Amelanchier, which it is much like in habit, except that its flowers are as large as a Philadelphus. The leaves are thin, alternate, lanceolate, entire, and apiculate. The flowers are from two to six on a raceme, white or cream coloured, with a serrated petaloid calyx, and a great fleshy green disk, in the centre of which stand five free carpels. Some of the flowers are male, and it was an examination of one of these which led to the surmise that the plant might be, what it is very like, and what Mr. Fortune called it, an Amelanchier. Living specimens have enabled Sir Wm. Hooker to show that this cannot be, and he refers the plant to Spiræa. That the fruit, when it is produced, will show the plant to be neither the one nor the other we cannot doubt. In the meanwhile we leave it with its latest name.

It is a very handsome plant, forming, when wild, a small bush; and if it should prove hardy, which is probable, it will be a great acquisition.

68. Libocedrus Doniana, *Endlicher; aliàs* Thuja Doniana, *Hooker.*

This singularly beautiful and interesting plant, which is a native of the north island of New Zealand, where it attains a height of from 30 to 70 feet, has stood the winter at this place altogether unharmed. It was planted in the early part of June last year in a situation facing the south and somewhat sheltered from the northern and eastern winds. It had also the advantage of a covering of Fir boughs during the intensity of the frost in winter; that, however, had been discontinued for many weeks previous to the 24th of April, the period at which the frost proved so very destructive even to the hardiest trees of the country. The specimen I forward will show in what excellent condition this rare and Fern-like form, from a climate, too, from which little can be expected to be hardy, has withstood the severity of a spring almost unexampled in its severity. *James Duncan, Basing Park, Hants.* [This is the Kawaka of the New Zealanders, and certainly a very pretty shrub or tree.]

Garden Memoranda.

Bentley Priory, Stanmore, Middlesex. — This charming country seat, as many of our readers doubtless know, belonged to the Marquis of Abercorn; but it has lately become the property of J. Kelk, Esq., the eminent builder. The house stands near the centre of a finely undulated and beautifully wooded park; the latter indeed had been permitted to get overloaded with timber, and therefore it has been found necessary to cut down many of the fine trees with which it was so copiously furnished, in order not only to bring its own natural beauties more prominently into view, but also those of the circumjacent country, comprising Harrow on the Hill, Hampstead Heath, and even in a clear day it is said that the Crystal Palace at Sydenham can be seen from the elevated covered platform or raised terrace in front of the drawing-room windows. From this point the visitor looks down on a neat geometrical flower garden, with beds on gravel, and margined with box, and cut off from the park by a low terrace wall surmounted with vases, which are also placed at regular distances on dwarf terrace walls along both sides of a broad straight walk which passes more immediately in front of the house. The latter, with the exception of such portions as have been altered or newly built by Mr. Kelk, is delightfully mantled with Ivy, which, being kept closely trimmed in, has a neat and cheerful appearance. Down in a hollow in the park, not very far from the south front of the house, and still half hid among trees, is a piece of water covering an area of some 8 acres; and now that such objects as were thought most striking and interesting have been brought within sight of the windows and principal walks, this forms a feature of no mean importance. Old walks have also been renewed and new ones made, and wherever the drainage was inefficient fresh drains have been put down. It will therefore be gleaned that the spirit of improvement is actively at work here.

The forcing-ground is walled in and lies near the stables on the west side of the house. We found here a long range of Peach houses and Vineries, in all of which were full crops; some of the Peaches were just ripe, and the Grapes, which are fair sized useful bunches, were beginning to colour. Nectarines are also a fine crop. In one house, a narrow steep one, Peaches and Nectarines are grown on the back wall and Vines in front, and in the other Figs on the back and Vines before them, and in both cases the two kinds of fruit are said to give every satisfaction. Melons and Cucumbers are largely grown here, there being five long pits devoted to their culture. Among the different sorts were Beechwood, with large and fine fruit; Golden Perfection, Bromham Hall, and Canteloupe. One house was filled with all the finer kinds of Pelargoniums, which are now just in perfection, and specimen Fuchsias, Balsams, and other things were growing on, to succeed them as soon as their beauty is over. On the front shelf were Calceolarias and New Holland plants. Cherries on the open wall are a good crop, and so are Figs; the latter Mr. Parker attributes to having the trees well wrapped up in straw during the winter, and keeping the covering on late in spring, by which all the autumn formed fruits are saved.

A walk covered for some distance with Hornbeam, in the shape of a Gothic arch, and passing through masses of Rhododendrons now beautifully in flower, leads from the forcing ground to the park, on the other side of which, about a mile from the mansion, lay the kitchen gardens, old-fashioned, walled-in places, but very productive. Strawberries promise to be plentiful here, and so do bush fruits, and on a west wall is such a crop of Plums as is rarely to be seen, even in the best of seasons; the trees are literally loaded with fruit, and they have never received the slightest protection. The sorts consist of Greengages, Magnum Bonum, Orleans, Imperatrice, &c.

The flower garden lays on the north-east side of the house. It is oval-shaped, with a broad gravel walk running its whole length, and ending in a rustic summer house; while another broad walk crosses it, and terminates in an Orangery, which has lately been put in good repair, and furnished with a new glass roof. The more remarkable features of this garden are its fine Cedars of Lebanon, Hemlock Spruce, Rose-covered walk, and temples. A raised mound covered with Periwinkle, and overarched with strong iron rods for training Roses on, formed a good back for a series of seats which had been fixed all round it, the arm-points being pedestals for setting specimen pot plants on, and the intervals between the seats being filled up with rustic pieces of wood, skilfully and tastefully disposed. From this resting-place views of the whole garden can be obtained. Many new standard Roses have been introduced here, as well as into the geometrical flower-garden in front of the house, and apparently with good effect. On either side of one of the entrance-walks are borders filled with herbaceous plants, and edged with wood which, when well painted stone colour, as this was, looks well and lasts good for many years. Over a portion of the other entrance-walk has been thrown an arch of Lime trees, which form a shady and cool retreat in a warm summer day.

The whole of the walks have been fresh gravelled and neatly rolled, and the place altogether is assuming a greatly improved form under Mr Parker's management.

FLORICULTURE.

Inconspicuous Props for Florists' Flowers.—Pinks, Carnations, and many other things which require to be supported by props, frequently present the appearance, when in beds, of a grove of sticks with plants tied to them, instead of an orderly mass of well shaped plants, which might be found, on examination, to owe their neatness to props, which without search could hardly have been discovered. The absurdity, where it is avoidable, of having props as conspicuous, or more so, than the plants which they support, is little recognised by gardeners or amateurs, but it is constantly pointed at by people of taste, who are not cultivators, and particularly by ladies. Plant growers have a kind of necessary respect for props, from knowledge of their value; but it seems to me this respect for their utility sometimes degenerates into an admiration of their appearance, which leads to their being made much more conspicuous than they ought to be. Be this as it may, it cannot be denied that the true idea of their being helps, which should be kept as much out of sight as possible, is too much overlooked. The best remedy which I have discovered for the evils alluded to, is the use of well painted straightened wires, of various lengths and thicknesses. For Pinks I have used 24 inch lengths of No. 11 wire, which, with two coats of green paint, are almost invisible, and proved perfectly firm and efficient as supports. For Carnations I employed with equal success and satisfaction 36-inch lengths of No. 6 wire (about 3-16ths of an inch thick), but wire of this kind would soon have become loose in the ground, its small diameter presenting little resistance to motion, and to avoid this I employed tapering wooden shods or sockets, about an inch thick at the upper end and 7 inches long. These were drilled throughout their length, so as tightly to fit the wires, the ends of which were passed through them, and projected about an inch beyond the small ends, which were thus pointed. The sockets were then dipped in boiling tar, and when this had hardened the wire received two coats of green paint. The firmness and efficiency of these props are most satisfactory, and equally so is their non-appearance. With an annual coat of paint, when out of use, they will last for years

and their first cost is trifling. Wires made quite straight by a wire worker, cost me 4*d.* per lb., which, for small sizes, comes very cheap per 100. The wooden sockets were made for me by a bobbin-turner, at 2*s.* 8*d.* per gross. When painting the wires I put a spoonful of paint into a woollen cloth laid in the hollow of the left hand, and draw them through it, a plan I find as good, and much more expeditious, than using a brush. This plan of supporting florist flowers was, I believe, first pointed out by Mr. Sivewright, of Cargilfield, near Edinburgh. *W. C.*

THE RANUNCULUS.—As this flower seems at present to be engaging some attention, perhaps the following hints respecting the way in which I treat and successfully flower the scarlet and yellow Turban varieties, may not be unacceptable; as, in my opinion, these flowers merit a prominent situation in every flower garden, on account of the brilliant display they create at a season when such is most desirable, and they do not interfere with bedding-out half hardy plants. In preparing the bed for the reception of the roots, I remove the soil entirely to the depth of 18 inches, replacing it by a few inches of drainage, addingabout a foot of rotten manure. On this I place about 6 inches of yellow loam (I do not incorporate the soil with the manure), I then rake it into a flat surface, allowing the bed to sink lower, if anything, than its edging, in order that it may the better convey water to the roots, and which they require in liberal quantities during a dry season. I plant the third week in November, in rows 4 ins. apart, with the dibble, inserting the roots with their prongs downwards. I then fill up the cavity with sand, raking the ground level, and gently patting it with a spade. As the blooming season advances, I protect them at night by placing hoops across the bed, over which I put mats to guard against sudden changes, as wind, frost, or rain; this I continue till they have done blooming; but in the daytime I remove the temporary covering, unless the weather should prove unfavourable. As sudden showers are likely to occur at this season, the cultivator should be on the alert, or his blooms may be seriously damaged. In order to prolong the flowering season, I shade during hot sunshine. By strictly following the above directions, not one of my roots ever fails to bloom. *J. F. M.*

Miscellaneous.

On the Manufacture of Paper from Vegetable Leaves.—M. Viven, of Paris, has obtained a patent in this country for a method of manufacturing paper from the leaves of trees, plants, &c., of all descriptions. In carrying out his invention, the leaves, which are gathered at a suitable season, are compressed into cakes, and then steeped in lime-water, or in alkaline solution, after which the mass is washed and reduced to pulp by any suitable means. This pulp is then treated according to the quality of the paper to be produced, by applying to it the different operations of sizing, bleaching, &c., in the ordinary way. If it is thought necessary, the pulp formed in the foregoing manner, from vegetable leaves, may be mixed with rag or other pulp in any proportions. *Mechanics' Magazine.*

Botanic Garden, Helsingfors.—After the great fire of 1827, the Russian Government was induced to remove the University from Abo to Helsingfors, which then became the centre of the sciences in Finland. A modern traveller has described the Alexander University and academical buildings and collections. He says, amongst other things, "Nor did the botanical garden answer our expectations, although its director was Professor Nordmann, who is so celebrated for his travels and many scientific writings. The stiff French hedges do not, indeed, look badly, but one had rather not see them in a botanic garden. The forcing houses were everywhere poor. It is, however, possible here to do much that can only be done in so northern a climate, and the name of Nordmann is a guarantee that that will be done." Near the botanic garden is the park, a convenient roomy public place, near the sea. *Botanische Zeitung.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Shading should be used sparingly here, except on bright days, for during dull unsettled weather plants require all the light that conservatories (the roofs of which are partially shaded by twiners) afford, and are greatly benefited by an occasional gleam of sunshine. The beauty of most soft-wooded plants will be considerably prolonged by the use of weak manure water, which should be given frequently wherever it can be done. Indeed, such things as Achimenes, Clerodendrons, &c., may be had in full beauty, from June to October, through being liberally supplied with manure water, but this must not be given too strong at first. Keep the atmosphere as moist as can be done; but avoid damp on cold nights, by leaving sufficient air to cause a gentle circulation, and spare no attention to keep the plants clear of insects. Stock for autumn and winter flowering will require careful attention, to get them sufficiently forward; for, so far, the season has been unusually cold, with comparatively little sunshine. Chinese Primulas, especially the double varieties, if at all backward, should be placed in a close frame, and shaded from the sun, where they will make rapid progress, particularly if the pots stand on a slight bottom-heat. Cinerarias, for early flowering, should also be potted and started at once, choosing the strongest suckers and placing them in a close shady frame till rooted. These are sometimes very subject to the attacks of thrips at this season; but if they are kept cool and moist, and smoked occasionally, there is no danger of their being clean and growing vigorously. COLD PITS.—The stock here will now be growing freely, and should be frequently examined individually, to see that all is going right; for plants, when growing rapidly, very speedily suffer through any neglect in watering, or from the attacks of insects. Examine young specimens that were potted early in the season, and shift at once such as require more pot room, so as to get the pots moderately well filled with roots before winter, in which state they are much more easily carried over the winter than when either over or under potted. Leschenaultias should be carefully examined for green-fly, and smoked at once if at all infested, and the flowers should be regularly picked off young plants of these as they appear. Chorozemas, Bossiæas, &c., must also be frequently examined for red spider, and should be laid upon their sides on a clean mat and thoroughly washed with the syringe, repeating this as often as may be necessary to thoroughly eradicate the pest. Young specimens of valuable hard-wooded plants should be carefully trained, keeping the shoots nicely tied out or pegged down in order to secure close compact foundations, upon which future success very largely depends.

FORCING DEPARTMENT.

PINERY.—So far this has been a most unfavourable season for securing well-ripened high-flavoured fruit; and such varieties as are apt to spoil at the bottom before the upper pips are coloured should be kept as dry as possible immediately that they show the slightest signs of colouring, keeping the atmosphere also as dry as can be done without serious injury to the rest of the stock; and slight fires should be used on cloudy days, giving a little air to dispel damp and keep the atmosphere in motion. Look well to securing a supply of fruit for late autumn and early winter use, which in cold sunless seasons is sometimes rather a difficult matter. Prepare the plants for showing fruit by keeping them dry at the root for a fortnight or so, after they appear to have completed their growth, and expose them fully to the sun, in order to give them a rather severe check. Those expected to show fruit in October and November should be encouraged to make free growth for the present. Be very careful in supplying young stock with water, as any neglect in this respect will probably result in their showing fruit prematurely; and attend to potting suckers in succession as regularly as they can be obtained. VINERIES.—Grapes intended to hang through the winter should be thinned very freely, and, if necessary, these should be gone over a second time, and leaving them, so that the berries, when fully swelled, will scarcely touch each other. And only a moderate crop should be left on the Vines; for, to ensure success in keeping Grapes fresh and in good condition till next March, the Vines must be in first-rate health; therefore be satisfied with a moderate, or rather late crop, in the late house. Keep the atmosphere of houses where the fruit is colouring in active circulation, using gentle fires by day, with abundance of air, and leaving a little air on at night, to prevent damp. If red spider appears inclined to be troublesome, wash the pipes, &c., with a mixture of soot and lime, and if the colour is objectionable, add a little soot. FIGS.—Trees that have been kept dry while ripening the first crop, and are now cleared of this, should be well watered at the root, and if there is any appearance of red spider, the leaves should be thoroughly washed with the engine. Give manure-water to trees showing a heavy second crop, and keep the atmosphere moist by frequently sprinkling the passages and borders, &c. Keep the shoots thin and regularly tied in, so as to avoid confusion, and expose all parts of the tree equally to the light. Where the fruit is ripening attend to previous directions, and keep the atmosphere and borders as dry as can conveniently be done. Assist trees in pots by giving them a liberal supply of manure water.

FLOWER GARDEN AND SHRUBBERIES.

Go over the beds frequently, and keep the young shoots of Verbenas, &c., nicely regulated and pegged down until the ground is fairly covered, after which the shoots may be allowed to grow more at liberty. On poor dry soils two or three applications of weak manure water, given at intervals of a few days, and when the ground is moist, will greatly assist in getting the beds covered without loss of time. See that Dahlias and Hollyhocks, &c., are securely staked and kept properly tied as they advance in growth. Manure water will also be useful to these, unless the soil was properly prepared for them. Remove dead flowers and seed from Roses, and give the autumn-flowering varieties plenty of manure water, in order to keep them in vigorous health, and secure plenty of wood for blooming in autumn. Those budded on the Dog Rose must be kept clear of suckers, which, when allowed to grow, weaken the head, besides having an unsightly appearance. Budding should be proceeded with during cloudy weather. Give plants, infested with green-fly, a liberal washing with the engine, or syringe them with tobacco water. Mildew is sometimes very troublesome after this season, and no time should be lost in dusting the infested plant with sulphur, for the enemy will soon spread and destroy the foliage, and ruin the plants for blooming in autumn. Proceed with the propagation of herbaceous plants, as expeditiously as possible, in order to get this work out of hand, and the glasses, &c., at liberty. Take advantage of showery weather to give the walks and lawns a good rolling, and endeavour to keep the Grass short and neatly mown, for nothing looks worse than badly kept Grass.

FLORISTS' FLOWERS.

Now will be a good time to put in the main crop of Pink pipings. They strike root soonest when placed on a gentle heat, and are covered with hand-glasses, but we have lately seen a large quantity doing well which were merely planted on a shady border, regularly sprinkled with water, and kept from the sun's rays by a covering of calico, stretched over hoops which spanned the beds. Cross impregnate to obtain seed for new varieties; always choose those with the broadest petals and smallest edges to operate upon; Constance, Prince of Wales (Bragg's), Mrs. Herbert, &c., are like what we mean. Carnations and Picotees will now require much attention, tying, disbudding, watering, &c. &c., with a vigilant eye for aphis; this may be removed with a camel-hair brush, but by no means bruise the insects on the pods with the finger and thumb. Get up Tulip bulbs; do not divest them of their roots or skins, when first removed from the soil; this is better done at a later period. Thin the blossoms of Hollyhocks, and take care that neither they nor Dahlias want water.

HARDY FRUIT AND KITCHEN GARDEN.

The late showery weather has been very favourable for the growth of Strawberry-runners, and a sufficient stock for forcing next season should be potted at once, and placed in a close shady frame, until they get established, which will soon be the case. Prepare ground for fresh plantations by heavily manuring and trenching, or if ground cannot be obtained at once, select the strongest runners, and plant them on a shady border in rich soil, to be transplanted with balls early next month. Asparagus beds can hardly have too much manure-water from the stable, or farm-yard tank, during the present month. On dry friable soils salt may be applied with advantage, but this should not be used on strong adhesive soils, as it keeps the ground wet in winter, and decays the roots. Finish planting out the principal crop of Broccolies and Winter Greens with as little delay as possible. Proceed with planting out Celery as ground can be spared, using plenty of manure, and keep it liberally supplied with water. Attend to staking late Peas, and keep the ground moist about those in a forward state, giving them a thorough soaking occasionally, which will be the best preventive of mildew. See to keeping up a supply of Salad, Spinach, &c., and sow a good bed of Cabbage for furnishing Winter Greens.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending July 6, 1854, as observed at the Horticultural Gardens.

June and July.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth. 1 foot deep.	Of the Earth. 2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 14th, 1847—therm. 93½ deg.; and the lowest on the 10th, 1851—therm. 38 deg.

Notices to Correspondents.

EPIPHYLLUM: *J P P.* A beautiful variety in the way of E. speciosum; but larger and more delicate in colour.‡

FUNGI: *Stuart and Mein.* It is the Bovista giganteum, or large Puff-ball—a very fine specimen.

INSECTS: *E D.* Your Potatoes are infested with the Aphis vastator to an extent which we have never before seen. We would advise you to pick off the infected tops, and burn or destroy them before the winged aphides appear. The long cold weather has checked the development of the lady-birds and Syrphidæ, but they are now appearing in great numbers, and will greatly assist in destroying the plant lice. *W.*

LANGUAGES. *A Young Gardener* should not ask silly questions.

LAWNS: *E F L.* If your Grasses are strong enough to smother your Chickweed and Groundsel, your misfortune may be remedied. Should it be otherwise, we advise you to get some gas-water from the nearest gas-works, and apply it to a small piece of the ground, by way of experiment. It may kill the weeds and may not hurt the Grass. If upon trial it is found too strong for the Grass, weaken it cautiously with water.

MAGGOTS: *J W* says he has had the greater part of his German and Ten-week Stocks destroyed by white maggots in the roots, both this year and last, and will be obliged by any correspondent informing him how he can destroy them.

MORPHOLOGY: *C R.* A very curious case. We should like to see it again later in the season.

NAMES OF PLANTS: *X X X.* Anthericum Liliago.—*Hill St.* It appears to be Aristolochia pallida, if it is a climber; but the flower is very young, and smaller than usual in the wild plant.—*A S.* 1 and 2, Abies cephalonica; 3, Pinus Cembra (?); 4, Probably the same. It is impossible to be certain of the names of such small specimens.—*Ballandyne.* 1, 21, 15, 3, 22, 2, Abies Pindrow; 4, 12, 6, 5, 10, 8, 9, Pinus excelsa; 13 and 14, Pinus insignis; 16, Abies cephalonica (?)—*Each.* Sagina procumbens.—*J A F.* 1, perhaps Gesnera pendulina; 2, G bulbosa; 3, Calceolaria perfoliata.

TULIP: *G C B.* It has never reached us.‡

TURNIP SOWING.

SUPERPHOSPHATE OF LIME, made from Bone, which is the best Manure for Root Crops (see the Royal Agricultural Society's Journal, Vol. vi., part 2). PERUVIAN GUANO, NITRATE OF SODA, BONE DUST, SULPHURIC ACID, and all other Manures of known value. The PEAT MOSS CHARCOAL COMPANY have appointed the undersigned Sole Agents for the Sale of this fixer and distributor of Ammoniacal matter. They are also Sole Agents (in London) of the Patent Sanitary Company for the sale of their "Nitrogenised Carbon."—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

SUPERPHOSPHATE OF LIME, Guano, Bone Dust, Sulphate of Ammonia, Gypsum, Agricultural Salt, Grass Manure, and other Fertilisers, of superior quality, on sale, at the Coprolite Mills, Durham Wharf, Deptford Creek, Greenwich.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

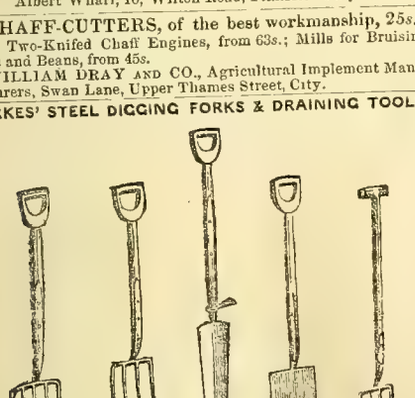
ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

PEAT CHARCOAL, free from adulteration of any description, the finest Deodoriser known, and afterwards forming one of the most valuable Manures. Invaluable in Private Houses, Hospitals, Cesspools, &c., and tends more than anything known to the sanitary condition of a City. Prices, free on board in Dublin, 40*s.* per ton; sacks charged only half price when returned in good condition, free of expense. To be had in any quantity on application to the WIGAN COAL COMPANY, 4, Luke Street; Mr. S. FRAZER, Ironmonger, Mary Street; Mr. G. READE, 113, Grafton Street; or T. BRIDGFORD & SON, 48, Lower Sackville Street.—Dublin, July 1.

TO AMATEURS, FLORISTS, GARDENERS, ETC. HOLES & CO. beg to inform Floriculturists, &c., that their celebrated POT MANURE, which has given such general satisfaction for so many years, may be obtained of all respectable Seedsmen and Druggists in packages, at 20*s.*, 10*s.*, 5*s.*, 2*s.* 6*d.*, 1*s.*, and 6*d.* each. For Amateur Rose, Fuchsia, and Chrysanthemum Growers, it will be found one of the best Fertilisers yet introduced.
Albert Wharf, 10, Wilton Road, Pimlico.—July 8.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*
WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

SCHOOL FOR GENERAL AND SCIENTIFIC EDUCATION (especially with regard to AGRICULTURE), Wickham Market, Suffolk, conducted by Mr. G. DOWNES.
At this establishment a sound and liberal education may be acquired on moderate and inclusive terms.
Soils, Minerals, and Manures carefully Analysed.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.
Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
The next SESSION will begin early in AUGUST. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.
The GUIDE TO THE ROYAL AGRICULTURAL COLLEGE FARM may be obtained of HAMILTON, ADAMS, & Co., Paternoster Row, London; and EDWIN BAILY, Cirencester. Price 1*s.*

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

REAPING MACHINE COMPETITION AT STIRLING.

THE STIRLING GENERAL AGRICULTURAL ASSOCIATION hereby offer the following PREMIUMS to be competed for during next harvest:—

1st, For the most approved Reaping machine, of any price £20 0 0

2d, For the most approved Machine, not exceeding 25 guineas in price 20 0 0

Should the judges fix on a machine of 25 guineas, or under, to be the best on the field, it will thereby be entitled to both prizes.

The price and simplicity of construction of all the machines will be taken into consideration in awarding the Premiums, but the Society reserves the power of withholding the Premiums if in the opinion of the judges, the machines are not of sufficient merit.

Intending competitors will require to enter with Mr. Hutton, their Secretary, at Stirling, not later than the 9th August, when they will have due notice of the time and place of competition forwarded to them.

Intending competitors must forward with their notice of entry the sum of 2*l.* sterling, to be returned on the morning of trial to those who appear on the field of competition with their machines.

The machines are to be tried on all kinds of crop, and upon both Dryfield and Kerse Lands, if required. The trials to be continued until the Judges and Committee appointed by the Association are satisfied.

Machine-makers entering machines are to state what price they will furnish such machines as they compete with to members of the Association, and farmers entering are to state the price they paid for those they compete with. By order of the committee. WM. HUTTON, } Joint
WM. FORRESTER, } Secs.
Stirling, July 5, 1854.

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.—The Society's SHOW AT ARMAGH, in the Province of Ulster, will take place on the 9th and 10th of AUGUST next, when Premiums and Cups to the amount of 120*l.* will be offered to competition for Farm Stock, Implements, &c.

Very favourable arrangements have been made with various Railway and Steam-Boat Companies for the carriage to and from Armagh, of Stock, Implements, &c., duly entered. Thus the Companies of the Ulster, the Ballymena, the Dublin and Drogheda, the Dublin and Belfast Junction, the Dundalk and Enniskillen, have agreed to carry all articles to and from the Show free, so also has the County Down Railway, excepting Horses. The Southern and Western, and the Great Midland Railway, will charge on articles going, but make no charge on articles returning, provided they have not been sold, or have not changed hands.

The City of Dublin Steam-Boat Company will carry to and from Dublin and Belfast, free by their boat, once a week; and the Belfast Steam-Boat Companies will charge articles going to the Show, but carry free those returning unsold.

The Committee have also arranged with the Agents of the Whitehaven, Morecombe Ardrossan, Carlisle, Greenock, Glasgow, and Stranraer Steamboats to convey Stock, &c., at half freights to and from Belfast.

All entries must be lodged not later than 19th July.

Prize Sheets, and Forms of Entry, to be had on application to ROBERT COCHRAN, Esq., Secretary to the Local Committee, Armagh; or, to me, at the Society's Offices, 42, Upper Sackville Street, Dublin. THOMAS HARKNESS, Secretary.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—PROGRAMME of LINCOLN MEETING.

THURSDAY, July 13.—Trial Yard open at Twelve o'clock at noon, when the public will be admitted, at Ten Shillings for each person, to view the Trials of the Steam-engines.

FRIDAY 14, SATURDAY 15, MONDAY 17, TUESDAY 18.—Trial Yard open at Nine o'clock in the forenoon, when the public will be admitted on each day at Ten Shillings for each person, to view the Trials of the Steam Engines, Barn Works, and other Agricultural Implements and Machinery generally.

WEDNESDAY 19.—The Implement Yard open to the public from Seven in the Morning till Six in the Evening; admission, 2*s.* 6*d.* each person.

The Judges to inspect the live stock and award the prizes.

At One o'clock (or as soon after as all the judges shall have delivered in their awards) the public to be admitted into the Cattle Yard, and to the Exhibition of Farm Poultry, on the payment of Ten Shillings each person, at the Special Entrance; Members of Council and Governors of the Society being admitted by Tickets to be purchased at the Finance Department of the Society at the Show Yard.

N.B. Notice will be posted up over such entrance when the judges have completed their awards. At Eight o'clock in the Evening the Yard will be closed.

The Dinner of the Society in the Pavilion adjoining the Show Yard, at Four o'clock: the doors open at Three. The Judges' Awards of Prizes for Live Stock will be read.

THURSDAY, 20.—The General Show Yard of Cattle, Horses, Sheep, Pigs, Farm Poultry, and Implements open to the public from Six o'clock in the Morning till Six in the Evening; admission 2*s.* 6*d.* each person.

FRIDAY 21.—The General Show Yard open to the public from Six o'clock in the Morning till Six in the Evening; admission One Shilling each person.

General Meeting of the Members in the Guildhall, at Ten o'clock in the forenoon.

YORKSHIRE AGRICULTURAL SOCIETY, OPEN TO THE UNITED KINGDOM.—The SEVENTEENTH ANNUAL MEETING will be held at RIPON, on the 2d and 3d days of August next. The Entry closes on July 19. Free transit for Stock, and half rates for Implements are conceded by the railways of the district, and by the Great Northern, London and North Western, and Midland Railway Companies.

Prize Sheets and Forms of Certificates are now ready, and may be had on application to the Secretary. JOHN HANNAM, Sec.
Kirk Deighton, Wetherby, July 8.

The Agricultural Gazette.

SATURDAY, JULY 8, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY,	July	12—Agricultural Society of England.
THURSDAY,	—	13—Agricultural Imp. Society of Ireland.
WEDNESDAY,	—	19 } Agricultural Society of England—
THURSDAY,	—	20 } Meeting at Lincoln.
FRIDAY,	—	21 }
THURSDAY,	—	20—Agricultural Imp. Society of Ireland.

OUR readers will notice in another column an extract from a letter by Lord EBRINGTON on the subject of agricultural education. We hope next week to call attention to the very important discussion which took place on this subject before the delegates from the various institutions in union with the Society of Arts, at their conference in the Society's rooms, last Wednesday.

WE once more call the attention of our readers to their interest in the progress and success of the trade museum, now in course of organisation by Professor SOLLY. The scheme and its gradual development have been already alluded to in past numbers of this journal, and it is satisfactory to learn that in all parts of the world it is meeting with favour and support. English agriculturists may, as we have already shown, contribute materially to the value of some of its departments, and to one of them we wish again to call their attention.

At the forthcoming Agricultural Show at Lincoln there will be a large number of first-rate fleeces brought together, and the presentation of the fleeces to the trade museum may doubtless be in the power of many who are, in fact, at present ignorant of its very existence. Let us press upon their attention the great practical value of a museum in which the best prize wools of former years would be seen. The museum has already in it a considerable number of very superior fleeces from all parts of the country, and a very large number have been promised, so that the collection cannot fail in a few months to be a fair representation of English wools.

Circulars have been sent to many breeders, but there is no doubt many others quite as large have been left out by accident; and it is in the hope that our remarks may meet the eyes of some of these that we publish this note upon the bearing of the Lincoln meeting on the subject. The collection is being formed for public use, all are interested in it, and all are invited to contribute fleeces or samples.

ADULTERATION OF GUANO.—In a late number of your Journal you published a statement from me regarding the ADULTERATION OF GUANO during the last few months. In accordance with my promise, I now send you a few remarks on the extent of remedy which the farmer possesses against the tricks of the dishonest dealer. There is not a great deal to say on this subject, and what there is has been well said before. Still it may do no harm to remind the purchaser of guano that he is not so helplessly in the hands of the dealer in sophisticated manure as is too generally believed to be the case. There are obviously two questions which the farmer will wish to have answered: the first, how he is to know whether a sample of guano is genuine or adulterated? the second, in what manner he is to proceed in the event of his discovering that he has been cheated? I might add another question to these, namely—on what grounds he is to *suspect* adulteration; for, to be assured of the fact, he must, I fear, have recourse to the analytical chemist. Nothing short of the certainty which this step gives will justify a purchaser in expressing a doubt of the honesty of the seller—still less of putting himself in an attitude of hostility towards him. Now, as I know, by long experience, that it is altogether useless to urge the general resort to analysis as a safeguard against loss, and, indeed, as I am more than doubtful of its necessity under all circumstances, it becomes very important, if possible, to point out to the agriculturist an easy method of forming an *opinion*, in the first instance, as to the genuineness of any given sample—as a preliminary step to the adoption of ulterior measures. Further than this, as I have already said, he cannot hope to go without assistance. Another thing seems very certain, that nothing is practically gained by attempting to teach those whose time and thoughts are fully engaged on the cares and duties of their own occupation even the simplest methods of chemical analysis. Here and there a young farmer may possess the information and appliances requisite for the purpose, and *he* needs not that your pages should be occupied by further instructions; but with the bulk of the farming community it is different, and a reliance on such means of forming an opinion is likely, in the majority of cases, to mislead, and to be productive of much more harm than good.

I am sure that I may speak with confidence for my chemical brethren as well as myself, when I say that, if a simple and unobjectionable method of determining the question, aye or no, of the adulteration of guano existed, it would long since have been placed at the disposal of the farmer. The only suggestions that I have to make on this part of the subject have reference to those external characters with which a person of ordinary observation, and with some experience in the use of the manure in question, will readily become acquainted.

The great peculiarity of Peruvian guano (my remarks apply *solely* to this variety) is its extreme lightness. The organic compounds in guano are all of low specific gravity, and this circumstance affords, perhaps, the best means of forming an opinion as to

its genuineness; for in the adulterating trade, as at present carried on, the substances employed by the dealer, that is to say, sand, clay, carbonate and sulphate of lime, common salt, and sulphate of soda, are all in a greater or less degree heavier than the manure itself. And in one or two cases which have been made public, the first suspicion of adulteration has arisen from a difference in weight being observed. Thus, in the trial for stealing guano, which, it will be remembered, took place a few years ago at the Central Criminal Court, and which resulted in the transportation of one man, and the imprisonment of his accomplice, attention was first called to the fraud, though indirectly, by the weight of the adulterated article. The agents of the Peruvian Government, Messrs. Gibbs, had supplied in the usual way, from a cargo on board ship, genuine guano, in bags which were *full*, and each marked with their weight. These bags were carried off to the premises of one of the prisoners, and the guano being emptied out was mixed with a quantity of loam. The fabricated guano was then returned to each bag, in weight corresponding with the marks on the outside, but the captain of the vessel to whom they were subsequently delivered, observed that *they were not full*, and mentioned his suspicions to the purchaser; additional circumstances, and in the sequel chemical analysis, left no doubt of the fraud, and the result was the conviction of the prisoners, as stated above. I have no doubt that many such cases have occurred without meeting the public eye.

I believe that the weighing of *a bushel* of guano will form the most simple and trustworthy means which a farmer can adopt for forming a preliminary opinion as to the purity of the Peruvian variety—that is to say, provided that he possess a standard of comparison furnished by the weighing of a sufficient number of good samples. Such a standard I am happily in the position to supply, through the kindness of Messrs. Anthony Gibbs and Sons, the agents of the Peruvian Government. The following list of weighings of guano was furnished to me by these gentlemen for use in a lecture which I gave upon this subject two or three years ago. I should explain that by "damaged guano" is meant that portion of a cargo which by leakage of the vessel during a long voyage may have become injured by sea-water. This guano is never sold in the usual course by Messrs. Gibbs as "fine guano," but is put up for periodical sale by public auction as "damaged" guano. There is also a further degree of injury called "doubly damaged," and a still further quality when the sample is actually "wet." But I have not thought it necessary to include these in the list, although they were given in that furnished to me.

Average Weights (in lbs.) of Fine and Damaged Guano, weighed in a bushel measure balanced, the importation of 1849.

Name of Ship.	Fine. lbs.	Damaged. lbs.
Aifred	70	7¼
Alderman Thompson	61½	71
Aliwal...	70	78½
Briton...	70½	76½
Britannia	71	80½
Beethoven	68	75¼
Ben Lomond...	70	75
Cuba	68½	75½
Envoy	70½	76½
Indefatigable	72	79¼
Iris	71½	84
Inconstant	68	80½
Jane Glassen	67	81½
James I. Foord	68	76
Lucy Wright	70½	78
Melissa	73	82½
Panama	71¼	79¼
Thomas King	65¼	77½
Victoria	71	80
William Bryan	68½	75¼
Total weight (20 specimens)	1386½	1557¼
Average weight of bushel...	$69\frac{5}{16}$	$77\frac{17}{20}$

With the second column we have here comparatively little to do, and I only give it in order to show that the addition of a quantity of water—itself not nearly so heavy as the adulterating substances—will sensibly alter the weighings, and because it may be urged by the dealer that a suspected adulteration is only a somewhat damper state of a genuine article. It is plain, however, that this shift will not serve, for a sample so "damaged" is not sold by the importers as good guano in the ordinary course of trade, and cannot honestly be resold as such.

The first column, however, is of much interest. The *average* weight of a bushel of good guano is shown to be between 69 and 70 lbs. The variations above this are not great, the highest number reaching 73 lbs. As a matter of course no serious objection could be raised against any sample having this weight, but a considerable excess above would be subject of suspicion. On the other hand, the variation *below* the average is of no importance, because the samples exhibiting it were evidently *superior* to the average. Unless, therefore, any change had occurred since these weighings were made (and I have shown that no such change has occurred), it may safely be assumed that a bushel of good guano weighs, on the average, 69 lbs., and that this weight seldom exceeds in any sample 73 lbs. I need hardly remark that the bushel measure must be balanced in the scale; that the guano must be filled in without pressure, and that (I presume) the surface should be levelled off with a piece of wood, as in measuring corn.

I had intended to apply to some of those from whom I have received this year samples of adulterated guano, to furnish me with weighings of these samples, but I have not had the opportunity of doing so. There are, however, amongst your readers, doubtless, many who have at the present moment within their reach samples of guano analysed this year by different chemists and found to be adulterated. I would suggest to them that they would be doing good service by publishing in your columns the weighing of a bushel measure of the adulterated sample, side by side with the analysis; a very important and valuable preliminary test will thus be supplied, if, as I cannot doubt, the weight of the fabricated samples should prove greatly in excess over those now given for the pure manure. Of course I am not ignorant that two experimenters will not get exactly the same result from any sample, but I do not attach much importance to this objection. I am aware also that a cunning "manufacturer" of guano may find means to evade this test, but at present I think that such means have not been adopted.

The only other character to which I shall call attention is the manner in which the adulterated guano behaves under the shovel. When thrown down it falls heavily, with comparatively little dust, and when allowed to slip off the shovel a very great difference is observed between good and adulterated guano, on account of the mixture of a light and heavy substance.

With regard to the second question, namely, how the farmer is to get redress for any fraud committed on him, I, of course, can only speak with great diffidence. It is a lawyer's question rather than a chemist's; but experience teaches us that successful opposition is not difficult. It is plain that the farmer stands better in a passive than an active position—that is to say, that it is far easier to refuse with success payment for a spurious article than it is to recover money once paid; and many instances have lately occurred where compulsory payment has not been attempted, or where a compromise has been readily accepted. But there is every reason to believe that a jury will always give a verdict in favour of the farmer in a flagrant case, and it is certain that those who have once launched on a course of dishonesty are never content with half measures—so that all cases of adulteration are *flagrant* cases. The only safeguard against fraud to which I have not alluded is that, which cannot be too often recommended, to deal only with persons of known character, or for several persons to combine in a district and buy direct from the importers.

The general adoption of this latter plan, however, is a slur on the dealers, which, as a body, I do not consider they deserve, and I am happy to believe that it is only called for in particular instances.

J. Thomas Way.

AGRICULTURAL EDUCATION.

Several efforts had been made, but made hitherto with little success, to improve the education of the farmers. The College at Cirencester had been established, to which I was a very early subscriber. It has lately, I understand, been working very successfully; but though it has educated many to be farmers, it has hardly numbered one farmer's son among its pupils; and its failure to answer this, its more especial object, proves that the remedy is not to be found in new and expensive institutions, in grand gothic buildings, with costly staff and establishments. An education in such, to be self-supporting, must be expensive; and unless self-supporting, it acquires an eleemosynary taint. Some time, however, last winter, it occurred to me, or rather to a friend of mine with whom I had been talking over the matter, that it might be possible—by providing for young men of the middle classes, and especially for young farmers, prizes for competition, and a standard of acquirements—to make a successful effort to develope the intelligence and spirit of application now, from want of incentives and guidance, lying dormant in many a farmer's son; and to cause either the voluntary self-improvement of many existing private schools, or else the spontaneous establishment of many better ones in their stead. The following is a sketch of the notion which occurred to us as the best means for attaining our object:—

That in the chief county town a yearly examination should take place under the patronage of the lord-lieutenant, county magistrates, or other influential persons connected with the county; at which examination all youths and young men of the county, whose parents or near relations were, or had been, in respectable and independent circumstances, might apply for a "County Degree," and compete for "County Honours."

That the "County Degree" be intended to fix and maintain a standard of education becoming an English man of the middle class.

That the "County Honours" be the reward of excellence in any one or more of the practical departments of knowledge, such as Agriculture and the Management of Stock, Chemistry, Mining, Navigation, Engineering, &c.

That, in addition to the "County Degree" and "County Honours," individuals be invited to connect with these examinations special prizes and scholarships.

The sole expense of this proposal would be the salary of a secretary to conduct correspondence, and the payment of examiners, many of whom, however, would be sure to act gratuitously.

If it should succeed, a very small fee on the conferring a degree (say 10*s.*) would provide a liberal sum for the secretary and examiners; and the expense of the "County Honours" (which would carry with them some substantial reward, such as books, valuable medals, &c.) would be met by a very small contribution on the part of those who take an interest in the county examinations.

The "County Degrees" would, of course, be recorded in a public register, and a "Book of Honours" kept.

"The Degree Paper, or Diploma, given to each successful candidate, should be stamped with a county seal, and signed by the examiners, and perhaps also by the lord-lieutenant or some other person of eminence in the county."

I had satisfied myself, from several inquiries I had made of persons likely to be right on such points, that (provided of course a sufficiently influential body of the gentry expressed their concurrence in the scheme, and their disposition to view with favour, and, *cæteris paribus*, give a preference to those who distinguished themselves at these examinations), this degree, thus stamped with public approbation, would be considered by any who came up for examination well worth 10*s.* to them as a testimonial, and, so to speak, a passport to favour and employment.

Of the friends to whom I mentioned this scheme, none expressed any positive disapprobation; all, but one or two, approved highly of the outline I had given, and at once said they were quite disposed to entertain favourably the proposal of working it out. I may mention among members approving, Lord Lansdowne, Lord Harrowby, Lord Yarborough, Lord Stanley, M.P., Lord Courtenay, Lord Ashburton, Sir Stafford Northcote, Mr. Sotheron, M.P., and Mr. Tanner Davy, a well-known Devonshire agriculturist, farming his own estate. But when I informed them of the communications I had had with you since my arrival in town, and of your having made me aware, for the first time, that the Society of Arts had already taken steps for holding examinations of the members of institutions in union with it, and for granting certificates of merit, these gentlemen felt with me that—even if the Society, on account of its comprehensive character as a Society for the encouragement of arts, manufactures, and commerce, on account of the services it has rendered to agriculture as well as to other arts, on account of its long existence, and of the illustrious patronage it enjoys, did not present (as we think it does) peculiar advantages for carrying out such a national scheme—it would be a pity needlessly to prepare and put in motion two sets of machinery instead of one, to effect objects so nearly identical, and apparently so readily attainable by a joint action, at once more powerful and less costly than separate action could be. They therefore agreed with me that the proceedings of the Society of Arts would render it expedient to defer taking further steps for the prosecution of the scheme I had sketched out; at any rate, till we had satisfied ourselves of the hopelessness of attaining our end by means of some arrangement with the Society. *Lord Ebrington, in the Journal of the Society of Arts, June* 30.

WHEAT IN SUCCESSIVE CROPS.

We have before us two plans of growing successive crops of Wheat on the same ground for 10 years past with equal success, but upon very opposite principles; the Rev. Mr. Smith's and Mr. Piper's, each producing about 4½ quarters, each realising an annual profit of 5*l.* or 6*l.* an acre, excluding last year, and yet it scarcely ought to be excluded, for their systems seem to have given the average crop, the falling short of which, in others, has caused the high prices. While Mr. Smith works up the undersoil, exposing annually fresh crude matter to the immediate action of the atmosphere, working out the principle of inorganic nutrition as existing in the soil, Mr. Piper is content to supply such elements of inorganic nutrition as are found in soot, with a mere superficial stirring of the soil. Is the deep working of Mr. Smith necessary? Is the soot of Mr. Piper required? Will not the continual stirring of the surface soil alone, by rendering it at all times permeable to the inflow of atmospheric fluids, be all-sufficient to produce those effects which are attributed to such very contradictory measures?

Either the soil and air contain all the constitutents of Wheat, as is the case in Wheat soils, or they must be artificially supplied as Mr. Smith proposes; but does the soot of Mr. Piper do this? Dr. Hodges says soot is a variable mixture of clayey matters, iron, sulphate of ammonia, gypsum, and certain organic compounds, and that its fertilising qualities are to be ascribed chiefly to the sulphate of ammonia which it contains; now soot appears deficient in silex and phos-

phorus, which, according to Liebig, constitute the chief requirements of Wheat. Are these constituents of Wheat found in sufficient quantities and in a fit state to be taken up by plants on the surface of Mr. Piper's field? It seems they are, for his returns say so; but will they be so found on the surface of all those soils that are commonly considered adapted for Wheat, and, therefore, render unnecessary the deep working of Mr. Smith to bring them up from the under soil? Or does the mere keeping open the surface, the breaking of its crust, the unpuddling of it, enable the air, dew, and light showers to enter and sink so deeply as to fertilise the under soil? To what, then, serves the breaking it? The roots do not require it should be broken up, for they will penetrate anywhere in which their prepared food is to be found; they are only to be stopped by excess of water or by an absence of it. In ground drained either naturally or artificially, we can scarcely doubt that the undersoil will have its inorganic elements of vegetable food so prepared—it could not else drain; the rain water must run through it and deposit in it the organic matters it contains, and which act upon them—the rain-water must also be followed by air. The only question is whether, for the continual cropping with Wheat, the actions so induced would be sufficiently rapid, or whether to render them sufficiently so the mechanical operations of Mr. Smith may not be required. It is possible that Mr. Piper may have acted on a mistaken notion in respect to his "conviction that Wheat would flourish best in solid soils, and that in ground which was comparatively undisturbed this crop might be grown for many successive years without fallowing." A firm bottom—that is, a bottom that has not been very recently disturbed, but has had time to consolidate since its last deep stirring, is probably best for all crops; for, as the water of its later saturation is not evaporated by recent exposure, the roots of the young plants are more vigorously attracted and drawn down by the moisture, while they find thus in solution their food in a more ready state for absorption; but this retention of water of saturation is, I think, promoted by the previous deep stirrings.

It has been recently remarked in this Paper that "the question of expense and doubt as to practical result, deter from a trial some theoretically well affected towards a system which, by continual mechanical tillage, can produce large yields without the assistance of rich manures." As to the practical result, surely the evidence of a naked fallow is sufficient, and Mr. Smith's tillage is, in effect, a naked fallow on half the ground. In the matter of expense—and what is this bugbear of expense, it amounts to just 30*s.* an acre for double digging; Mr. Piper's soot comes to 2*l.*, and other people's manuring would very likely exceed this. In the matter of expense, then, even with hand labour, such a modification of Mr. Smith's plan may be worked as will reduce it so as to leave it no longer an obstacle. Mr. Smith insists on bringing up annually an inch or two of fresh subsoil, and this he does with the fork. In this double digging lies the dreaded expense; yet surely if, as Mr. Piper's practice evidences, the Wheat plant does not require a breaking up of the subsoil, the exposure of a couple of inches of crude soil to atmospheric action would supply a sufficient amount of inorganic food for very many years; the double digging then would only be required at very wide intervals of time, say once in six years, and this frightful item of expense would then be reduced to 5*s.* an acre.

Mr. Smith contends, and, I think, in doing so injures his cause, that only one moiety of his ground is in Wheat. I would say the whole of his ground is as much under crop as a broadcast field is. Were it possible to measure the space of unoccupied ground between every stem in a broadcast crop it would probably be found that the unoccupied ground equalled that of the rowed crop; the stems on the latter would amount to, if not exceed in number those on the former; but it is upon other ground that I advance that the whole field of Mr. Smith is under crop. We cannot doubt that there is a constant underflow of vegetable food running through the whole soil, drains could not act were it not so; we scarcely require evidence that a similar continuous flow of atmospheric food takes place above ground. We know that wherever there exists an aperture for the discharge of a fluid, that a current tending to it will be established to an indefinable distance; this aperture exists in every pore of a leaf, in every spongiole of a root fibre; from all the unoccupied space of air in Mr. Smith's intervals the leaves of his Wheat draw in their gaseous food, from all the uncropped soil of the intervals do the roots of his Wheat suck in the soluble matters they contain. The advantage of the wide-drill system is that the whole of the unoccupied space which is dispersed over the broadcast field is collected in lines, so that what is impossible in the broadcast, or only once in the spring can be imperfectly effected by harrowing, becomes easy in the rows through the entire period of the growth of the crop—the unpuddling of the surface.

Now, I would submit a mode of operation (rather an Irish one) which I consider has some advantages, and is not very heavy in expense of hand-labour, while it retains all the principles of Mr. Smith. I would plough the land in 5-feet ridges, run a light furrow plough with a pair of horses, *tandem*, in the furrows till I had loosened all the surface soil, throw this up with the shovel on the ridges, and drill on them my three rows of Wheat (or Potatoes as we would probably do in Ireland, our despised lazy-bed fashion—why lazy-bed?); repeat this for three years, changing each year the furrow (or which may be better, though Irish, two years with Potatoes, and the third year with Wheat. In Ireland the lea is very generally so broken and manured the first year, the second year it gives still better Potatoes without manure). Every year during the growth of the crop I would break up the subsoil in the furrows either with the fork or the two-horse furrow plough, as could be best effected; and thus in three years the whole soil would be deepened, and the crude subsoil well aërated by exposure to the immediate and continuous action of the atmosphere for several months, while from the working soil of the furrow being thrown on the beds, an additional depth of soil on them of more than one-third would be immediately obtained. I certainly prefer the two years' Potato-fying for many obvious reasons. There are, however, many others of our green and Pulse crops that may be substituted for Potatoes under a similar treatment. *J. M. Goodiff.*

Home Correspondence.

The "Economic" Manure.—I have read your observations upon the analyses of the economic manure, and as I see my name appears among other testimonials in its favour, I beg to state that it has been unwarrantably introduced without my leave or approbation. I know nothing whatever of the parties beyond my being instigated by the recommendation of Mr. Coveney to purchase half a ton, for which I paid 6*l.*, as I was induced to make an experiment with it to prevent mildew upon my Vines, for which it was strongly recommended. After I had obtained it I was, from time to time, solicited for an opinion of its quality. I at length wrote to him, stating that I could not form an opinion, not having used it, except in a very small quantity to some Cabbages, which it had improved, as the growth appeared to be promoted—the application being more liberal than would have been made in the ordinary mode of farming. This portion of my letter I find has been extracted, certainly without my assent, and converted into a testimonial, which I disavow any intention of having made. I hesitate giving testimonials for any description of artificial manure, as there is nothing to show that the public will be supplied with the same quality, and I beg to observe that I have never done so except upon one occasion, some five or six years ago, although I have learned that I have appeared in testimonials of like nature to the one now referred to. *Robert Baker, Writtle, July 4.* We have also received the following:—"I received a sample of the 'Economic Manure,' a portion of which I enclose. I afterwards got a cask and observe the difference in appearance is very great; it seems to me the manure is made by guess, and this is probably the reason that there is so much difference in the three analyses in the *Chronicle* of Saturday last. I also enclose a portion of the manure contained in the cask. Had I not seen such respectable testimonials, I should not have been induced to try it. *J. Carter, jun., Keighley, July 4.*" [We shall have some further remarks to make on this subject in reference to the distinction between the *intrinsic value* and *agricultural effect* of manures.]

Pigs are very gross feeders, nothing comes amiss to a greedy hog—roots, herbs, fruit, grain, flesh, fish, and even hay, straw, and fresh manure. In the fold-yard and fallow fields he is a very useful fellow; but in grazing lands he does injury by rooting, by pulling up Grass roots, and by his dung proving nauseous to other stock. He is very soon affected by change either of food or weather. Frozen or sour swill and putrid flesh is very pernicious. Night air and cold rains are the great cause of every ill suffered by young pigs; sour-milk, buttermilk, or bran mixed with water, will make them scour; but steamed roots, mixed with meal, milk, whey, or even water, given warm and in warm sties, will make them thrive faster than any other animal. Raw Potatoes or other roots are injurious to them, while old pigs will get fat upon such food. Pigs should not be put together for fatting in too great numbers. Few feeders take a physiological view of the subject; nevertheless, they mostly adopt the principles. Young pigs require those varieties of food most adapted to promote the healthy development of frame—older pigs those kinds that fatten fastest, hence Pea and Bean meal, Indian meal, Oatmeal, milk, whey, &c., are best for young pigs; while, in addition to these, Potatoes and other roots, steamed, and Barley-meal, greave-cakes, bran, pollard, &c., are best adapted to fatten older pigs: greave-cakes are highly recommended for quick fattening. It is improper in breeding to put two animals together under any great disparity of kind or circumstance—the produce will assuredly be defective in many points; there should be assimilation in size and frame. It is best that the female should be of the larger breed in crossing, and in all cases of attempted improvement, a fine well-formed female must be selected. The most symmetrical animals in all breeds have been produced from a rather large, good, and well-made female, and a good male of moderate size. Pigs will fatten rapidly on grains for a time, afterwards they must have more nutritious food. The refuse of distilleries is fine food for fatting if judiciously applied; it must be given warm, and frequently thinned with water; the oftener this food is alternated from thick to thin the better—sometimes given thick, sometimes thin, to suit the appetite. The refuse of starch-works is far better food than either grains or wash, and will fatten quick and thoroughly; but it is better to mix these saccharine and glutinous compounds with farinaceous matter, to prevent cloying in the pigs. Fattening on crude or dry grain is not good management; it will sometimes cause death by swelling in the stomach, which, indeed, it sometimes bursts after eating to excess; it should always be soaked if given as grain—much better to grind it. If made into malt, all the better. Barley bread or cake, soaked in milk or whey, is said to be unsurpassed for efficacy in fattening. Bean-meal fattens rapidly, but makes the bacon hard and "craunchy." Indian meal fattens very quickly, and makes solid, firm good bacon. Barley-meal is superior to either, and produces excellent quality in the bacon. Pea-meal, mixed with whey or milk, fattens young pigs admirably, and produces the finest quality of pork. Wheat-meal: this is too expensive, and only the coarsest kind is used; it will fatten freely, but the meat is light and flabby. Oatmeal fattens satisfactorily, and produces the most delicate meat as to flavour. Tare-meal—a meal from Tares—is similar to Bean-meal, but not equal to it in efficacy. Linseed-meal fattens very rapidly in mixtures with other meal, but makes the bacon oily and flabby. Acorns and Beechmast are good for store pigs, but fatten very slowly, and never well. Acorns produce good firm bacon; but the bacon from Beechmast feeding is coarse and flabby, with unsound oily fat. Bran, pollard, and seeds of weeds are very slow fatteners. There are so many considerations to be taken into account in pig economy that much more might be said; but I shall merely remark that amongst farmers the management of pigs is very much to be condemned—they are left, in reality, to shift for themselves. They should from their birth be carefully fed and brought on continuously till fattened; if left uncared for, or only now and then attended to, they will prove unprofitable. No animal will pay better for careful nursing and early feeding than the pig. *L.*

Tobacco.—The Virginian Tobacco of commerce, if properly cultivated, grows to the height of 4 to 6 feet. Its leaves are large and expansive; the lower ones, with footstalks, decurrent down the stems; the upper, without stalks (sessile), oblong, accuminate, of a rich yellowish green. When they are freely grown, in an open situation, under the influence of a powerful sun at mid-day, these leaves exhale an odour sensible at a considerable distance. The directions which follow are founded upon an experience in Berkshire, on a deep loamy soil, with good aspect. Tobacco, like the Potato, is tender, and impatient of frost while young, but when once brought into vigorous growth, it becomes firm as the Sunflower. The seeds are small, and ought to be sown by the third week of March, in a pan of extremely fine and sandy soil, just below the surface, slightly pressed down and made level, employing the gentle, rather moist, warmth of a hotbed or propagation house. The seedlings should be dewed from the finest rose of a watering-pot, and progressively thinned to regular distances. When they have acquired that proper substance and strength which a good propagator understands, let them be removed singly to the smallest pots (drained with one-third of an inch of genuine peat or bruised wood-charcoal), and filled with light sandy loam, then gently watered, and shaded in a warm frame till thoroughly established. Removal to a larger pot, wherein another firm ball of roots might be formed, would, without loss of time, be advantageous. Fifty fine plants should yield an ample supply of noble leaves for purposes of fumigation; though to have a greater number as a reserve might be prudent, for there are underground enemies which are apt to do some injury to the rows. In selecting a situation, prefer one open to the south sun, let it be thoroughly double-digged and manured at bottom (that is at 18 inches below the surface), with a 3-inch layer of good spit dung, covering it with the finely pulverised soil raised by the spade so as at first to be 6 inches above the adjoining ground. When settled, be careful to avoid a damp and clodding state of the soil; then, straining the garden line, transfer each plant with its entire ball, into a hole made with a garden trowel, the earth being previously loosened by the tool, and the exterior roots of the plant a little freed by the fingers before placing it in its hole. To judge of the dimensions of the prepared site, the plants ought to stand 20 to 24 inches apart in a rank, the rows to be about 2 yards asunder. As the planting advances, the earth ought to be gently insinuated by the finger (the best instrument) among the liberated fibres, and laid basin-form around the stem, to receive a liberal supply of soft pond water, immediately given through a fine hose. The middle of May, if fine, is an appropriate period; and if the plants be then 6 or 7 inches high, with a stout stem, the promise of success will be great. Curing: The removal of side laterals is recommended by some as favouring the growth of expansive main leaves, and we see no objection to the practice. By the maturing sun of July and August the full-grown leaves will probably become somewhat flaccid and of a yellowish tint; they ought then to be cut off close to the stem, the midribs carefully pared with a very sharp knife nearly level with the under surface of the leaf plates; then string them in pairs, and suspend them under an airy shed till the sap be carried off or absorbed. Thus air-dried in the shade, the leaves become dry and lax, but not brittle; they are then to be laid as flat as possible in a box, to which a stout lid is fitted that will drop upon the herb. The leaves must be successively collected, because many will be ready for the box pressure before the growth of others shall have ceased. As the stock accumulates, the pressure must be increased, always taking care that there be no dampness or tendency to fermentation and decay. Experience justifies the assertion that, however careful the preparation, the leaves are never sufficiently pungent even after the hottest summer. It has therefore

been necessary, at the last stage of drying and pressure, to interpose between every two leaves a small proportion of the strongest shag or "returns" tobacco, and also a few grains of finely powdered saltpetre. Thus, if 500 leaves, to be collected by the end of September, and by gradual drying and pressure, become pale brown, with a sensible odour of tobacco, 20 ounces of the foreign, and one-fifth of that weight of nitre will be enough for the whole stock. Each leaf as it is deposited straight in a box receives its portion of these materials, and thus if the curing and pressure be cautiously conducted in a dry room during winter, not a leaf will decay, and by the time that aphides begin to appear, a copious supply will be obtained in a state fit for direct fumigation with the bellows, or by burning over charcoal in a grated pot, bored, to admit the nozzle of that instrument. Tobacco paper is made by soaking stout brown paper in a very strong infusion, adding sufficient saltpetre to produce a slow touch paper. This paper is exceedingly pungent; it would therefore be prudent to burn in pots, below the stage of a house, and not in the bellows. *J. T.*

Ammonia from Waste Coal.—It was suggested, some time since, by Professor Way, that small coal might be distilled at the pit's mouth, where it is worth little or nothing, for the ammonia, 20*s.* worth of which may be had per ton of coal. If Mr. Young's patent, for paraffine, &c., were employed for the purpose, giving but little gas, most of the products valuable and portable, and converting the worthless small coal into rubbly coke, in constant demand for locomotive engines, it would appear likely to be a profitable undertaking, and the enormous accumulations of small coal would be a supply for many years. *J. Prideaux.*

Valuation of Land (Scotland) Bill.—Can you tell the reason why deer forests and unlet shootings are excluded in the "Valuation of Lands (Scotland) Bill," now before Parliament. To us here, their exclusion and consequent exemption from all public burdens, appears to be a piece of bare-faced class legislation. Surely the representatives of the people are not aware how much deer forests and shootings already cost the community, or they would not thus publicly allow a bounty to be offered for their increase. *A Forfarshire Tenant.*

Societies.

ROYAL AGRICULTURAL SOCIETY.

MONTHLY COUNCIL, *July* 5.—Colonel CHALLONER, Trustee, in the chair. Twenty-seven new members were elected.

FINANCES.—Mr. Raymond Barker, Chairman of the Finance Committee, submitted to the Council the report on the accounts of the Society, from which it appeared that the current cash balance in the hands of the bankers was 1305*l.*

LINCOLN MEETING.—Mr. Miles, M.P., reported from the General Lincoln Committee, the completion of the works for the meeting, the application made as usual to the Secretary of State for the Home Department for the grant of a certain number of detective police from the Metropolitan Force, the notification from the French Government of a special deputation to the Lincoln Meeting, the arrangements concluded with the principal railways for the conveyance of stock and implements, and the details in progress connected with the Pavilion Dinner.—On the motion of Mr. Raymond Barker, seconded by Mr. Barnett, Messrs. Smith, Ellison, and Co., of the Old Lincoln Bank, were unanimously requested to act as the local bankers of the Society during the period of its ensuing country meeting.—The Council completed the number of Judges required at Lincoln in the several departments of the show.

JOURNAL.—Mr. Pusey transmitted from the Journal Committee a copy of the new Journal just printed off, and in the course of distribution, postage free, among the members of the Society throughout the country.

PARIS EXHIBITION, 1855.—Captain Owen, R.E., addressed to the Council from the Department of Science and Art, Marlborough House, Pall Mall, the following communication, dated the 28th of June last:—

I am directed by the Lords of the Committee of Privy Council for Trade, to request you to take an early opportunity of laying before the Council of the Royal Agricultural Society, the accompanying papers relative to the approaching Paris Exhibition of 1855. My Lords are very desirous that the important department of agricultural machinery and implements should be fully represented upon this occasion, and they would be much assisted if the Council of the Royal Agricultural Society would yield them their support. Mr. Brandreth Gibbs has been so good as to undertake the general superintendence of this department under the direction of my Lords, but as it is to be apprehended that the space which it may be possible to allot to agricultural implements may be limited, it would be desirable that some independent tribunal should be appointed, which could decide how the space may be best disposed of, so as to secure as complete a representation as the space will admit of. My Lords would be greatly assisted if the Council would name from four to six persons to act as a committee, in conjunction with Mr. Brandreth Gibbs, for this purpose.

On the motion of Sir Matthew White Ridley, Bart., seconded by Mr. Barnett, the following committee was appointed to act with Mr. Brandreth Gibbs, in pursuance of the request of the Board of Trade:—Mr. Miles, M.P., Colonel Challoner, Mr. Hamond, Mr. Fisher Hobbs, Mr. Chandos Wren Hoskyns, and Mr. Brandreth.

LINCOLNSHIRE FARMING.—Mr. Thurstan G. Dale, secretary to the local committee at Lincoln, transmitted to the Society a copy of "A Farming Tour; or Handbook of the Farming of Lincolnshire," prepared by "A Lindsey Yeoman," for the occasion of the Society's ensuing country meeting.

Adjourned to special meetings on Tuesday and Friday next at Lincoln, and to their monthly meeting in London, on the 2d August.

SEED-GROWERS': KELVEDON.—The system hitherto pursued by the growers of agricultural and garden seeds is without parallel in the annals of British trading. For a series of years it has been the practice of growers to leave all power in the hands of the London seed merchants, permitting them to give what they thought proper for their produce after they have them in their possession, thus affording them a complete monopoly over grower and consumer; and until very recently no article found its way to the consumer but through the London trade, except, perhaps, the home counties, wherein the seed is grown. The result has been large profits to the merchants, at the expense of the growers' just rights, and the occasion of many disappointments and heartburnings. This has to some extent been altered, by the increased facilities of transit by means of railroads and cheap postage—bringing those who have been and still are to a great extent customers to the London trade into communication with the grower; but here also the evil of the monopoly has been severely felt, for whilst the grower has been in their power, the London trade has endeavoured to drive every competitor out of the market. This has greatly aggravated the evil of the anomalous position in which the grower is placed, occasioning ruinous prices, which have been only increased during the past season by the almost total failure of most crops. So manifestly unjust has it of late become, that the growers have determined to extricate themselves from the unfair position in which they are placed. To effect this, a Society has been formed at Kelvedon, Essex, called "The Seed-growers' Society," its object simply being to sever the chain which has been drawn around them, and to protect their own interests by promoting freedom of trade. At a second meeting, held at the Star Inn, Kelvedon, a code of laws was unanimously agreed to, and the Society placed on a solid basis. The co-operation of all growers of seeds is solicited, not only as advantageous to themselves as individuals, but to growers and consumers generally. It is not the intention or wish of the members to sever their connection with the London merchant, but to place their transactions with him upon better and more enlightened principles, and more in accordance with the spirit of the 19th century. The spirit of the meetings already held has been most satisfactory, and has kindled the hope that an alteration will be speedily conducive to the interest of all parties concerned. The intention of this statement of the necessities and position, past and present, of the grower of seeds, is to induce those who have not yet connected themselves with the Society, or who may have been ignorant of its existence or principles, at once to do so, in order that the object aimed at may be at once secured. *Copied from the Chelmsford Chronicle.* [Will "A Friend of Progress and Freedom," who has sent us the above, be kind enough to state what are the "principles" of the Society, and how it is proposed to put them in practice.]

Reviews.

The Journal of the Royal Agricultural Society of England. Vol. XV. Part 1. John Murray.

THE current number of the Journal is hardly so interesting as some that have preceded it. A paper on Trunk Draining by Mr. Clarke, of Long Sutton—a gentleman who bids fair to be, if he be not already, the first authority on that subject in this country—is the opening article. Professor Way on Sewage Manure, Mr. Haxton on Light-land Farming, and a portion of the opening description of Oxfordshire Farming, are the other principal contributions. Of a less important character are the papers by Viscount Downe, on Bearing-reins; by Mr. Finlay Dun, on Hereditary Diseases of Cattle; on Finger and Toe, by Professor Buckman; on Ægilops, translated from the French; on Hollow Brick Roofs, by Robert Dun; and on Nitrate of Soda and Guano on Peat, by J. D. Nicol.

From some of these papers we shall take extracts in future numbers. The article on sewage is probably one of the most important of them, pointing out, by the aid of independent researches, as well as by the light of previously published information, the limits within which the possibility of the agricultural usefulness of the subject exists. The more the matter is investigated the less promising to the farmer is the aspect it wears. The following is the conclusion to which Mr. Way has been led:—

"It may be asked, is there then no plan by which a solid manure of sufficient value can be prepared from sewage? My own conviction is, that as yet no plan has been suggested which, with a due regard to the farmer's interests, unites the prospect of a paying speculation. Of course I speak now of a manufacture in which sewage is the staple raw article. It is quite possible to mix other matters, such as the refuse substances of large towns, with the solid deposit of sewage so as to make a good manure, at a fair or even a low price; but in this the merit lies with the substances added, not with the sewage itself; and such a manufacture is obviously very partial and limited in its application.

"It has always appeared to me that this question of sewage-water is regarded in a wrong light. A most exaggerated opinion of the prospects of manufacturing manure from it is entertained by local boards of health and town corporations. Not content with making arrangements by which the removal of the refuse and the cleansing of their watercourses is to be obtained, they in many cases stipulate for a rental for the right of taking the sewage matter. I do not doubt that if the *liquid sewage* could be properly distributed over the extent of surface which it is capable of fertilising, a revenue would be forthcoming towards the reduction of the town rates. But in the absence of arrangements for liquid distribution, and unless we should discover some process far better than any we possess for the solidification of the sewage, I am convinced that the results must be all the other way: that is to say, the towns must be content to *pay* towards the operation, instead of looking to it as a source of income. The question is indeed a compound one—sanitary and agricultural. It is of the utmost importance to the town populations to remove their refuse matter without polluting the neighbouring streams. By the aid of existing processes this object can be satisfactorily accomplished; and the water supplied to a town may be restored to the watercourses in a comparatively unobjectionable form. But the manure so produced cannot be sold at a profit—unless, indeed, the farmer, by giving more than its value, is made to pay for the sanitary improvement of the towns. It is useless to urge that a manure made in this way can be sold, and has been sold, largely at an amply remunerative rate. No one who is acquainted with the nature of farming operations, and with the difficulty of estimating and tracing to their true source the effects of manure, will doubt that for a time even the very poorest manures may have a sale, particularly if the price is temptingly low. But this state of things does not last: and the price at which the solid sewage manure will ultimately find buyers will be below the cost of its production.

"The true policy of towns is to take this matter, in some shape or other, into their own hands. Their primary concern should be to effect the sanitary objects thoroughly, looking to the manure as a set off, greater or less, against the expenses incurred in securing the increased health and cleanliness of their populations."

We should be careful of any style of remark which may have the effect of reviving the old antagonism of interest between town and country; but there can never be harm done in stating the truth in a proper spirit, and Mr. Way does good service to town as well as country by urging the sanitary aspect of the sewage question, as demanding first consideration.

The only other paper we shall notice just now is that by Professor Buckman, on "Anbury." The conclusion he arrives at is that this disease is not properly so called—that it is simply a case of degeneracy towards a natural state of the root. We shall, for the present, merely state this conclusion in his own words, hoping for an early opportunity of laying the entire paper before our readers.

"From the foregoing remarks it will be seen that finger-and-toe in roots is not viewed by me as a disease, in the strict sense of that term, but as a natural result of the early stage of change from wildness to civilisation. The enumerated experiments seem to show that finger-and-toe is the midway from wildness to cultivation; and our observations upon the circumstances connected with cultivated root crops show that the malformation in them is the result of degeneration from cultivation to wildness."

Poultry.

Ceylon Poultry.—The Jungle fowl is abundant in all the uncultivated portions of Ceylon, but particularly so in the northern and north-western provinces. It comes out to feed morning and evening upon the roads, cultivated lands, or other open places. The cocks are generally seen alone, seldom in company with their hens, which, however, are always in the neighbourhood, and keep together, even though their broods may be of very different ages. The cocks fight most desperately in defence of their seraglios, the combat frequently terminating in the death of one of the engaged parties. As they not unfrequently mingle with the fowls of the lonely villages, they cross with the domestic breed, being more than a match in courage for the plebeian dunghill cocks, and armed with tremendous sharp spurs. Mr. Mitford, of the Ceylon Civil Service, showed me, while at Ratnapoora, a hybrid hen; her general appearance and call much resembled that of the wild bird; her eggs also partook of the spotted character, but Mr. Mitford never succeeded in rearing any chicks from them, as they were always addled. The bird was very tame to those with whom she was acquainted, but fled precipitately at the approach of strangers. The hen selects a decaying stump or thick bush for a nesting place, and lays from six to twelve eggs, of a fine rich cream colour, finely mottled with reddish brown specks. Axis 1 in. 9 lines; diam. 1 in. 4 lines. The young when just hatched resemble young chickens, and the old mother leads them to decaying prostrate trees, and scratches for white ants, which they eagerly devour. They are hatched in June. In wet weather, Jungle fowl keep much to thick trees, sitting disconsolately with drooping head and tails among the branches; they also roost in trees at night, retiring to rest early. It is rarely that a bird can be flushed, but when they do fly, it is very much in the manner of the pheasant; they run with incredible swiftness, and trust to their powers in this respect for safety. Their cry is a short crow,

which resembles the words "George Joyce," sharply repeated. It may not be out of place here, while upon the subject of Jungle fowl, to mention the varieties of domestic breeds which are found in the island. The usual kind is the common fowl, which is considerably less than the English breed, and lays a much smaller egg; it runs through all the same variations of plumage; but there is one curious variety, which I cannot describe more aptly than by comparing it to a white fowl drawn down a sooty chimney. On preparing one of these fowls for the table—at which, by the way, they excel all others in flavour and tenderness—the skin and periosteum are found nearly black; the roof of the mouth, tongue, wattles, and legs are also of a deep leaden hue. It is a remarkable fact, that a male bird of the pure sooty variety is almost as scarce as a tortoise-shell tom-cat. The Cingalese call these fowls "Calloo-mas-kukulo," literally, black-fleshed fowl. Kukula means cock (or fowl taken as a whole); kikili, hen; kukulo, plural, fowls. The ingenious and learned author of "Ornamental and Domestic Poultry," at page 392, second edition, refers to these fowls as having silky feathers, but with us in Ceylon this is not the case. The Frizzled or Friesland Fowl, of the same author (page 394), is also domesticated in Ceylon, but it is rare; the Cingalese called it Capri-kukulo, and say it was originally imported from Batavia. This accords with Temminck's statements. The Rumpless Fowl, or Rumkin (*ibid* p. 387), is also plentiful, but only in a domestic state. Temminck's assertion that it is a wild inhabitant of the island is surely a mistake, and the Governor (Loten, I presume), who forwarded him the information must have been deceived by some head man or other. I am quite confident the bird does not exist wild in Ceylon; the very native name, "Cochi-kukulo," Cochin fowl, implies its foreign character. The Cochin China Fowl (*ibid* p. 289), and Malay Fowl (p. 299) are both found in Ceylon; the former is called Mahacochi-kukulo, or large Cochin fowl, and is common enough. I have purchased them for 7½*d.* each, while residing at Pt. Pedro; I mention this as a contrast to the absurd prices given in England. The Malay fowl is found principally about the lines of the native Regiment of Ceylon Rifles; they belong to the Malays, and are used in fighting, a sport of which that people, as well as the Cingalese and Tamuls, are passionately fond. I however never saw the true game cock in Ceylon. Creepers (p. 384) are frequently met with; their curiously short legs at once distinguish them from the common breed. One variety has feathered legs, but I never met with true bantams. The Poland or Polish Fowl (p. 364) was introduced many years ago by a relative of my own, the original birds having been procured from my father. I am not sufficiently acquainted with all the varieties of domestic fowls to state if other kinds are found in the island; probably some which I have called "common fowls" may be more valuable varieties. *Layard, in Annals of Natural History.*

POULTRY. I have lately seen a splendid bird, the father of which was a pure "speckled Dorking," and the mother a cross between a "Dorking" and "Cochin." I never remember to have seen a bird, which by being put to short-legged Dorking hens, I would prefer using for the foundation of a yard of Dorking fowls; he showed no signs of his false strain, and the only thing to excite suspicion was his being somewhat longer in the shank, a fault, upon which did not fashion put her "veto," I am inclined to consider not altogether an undesirable one; his body was square and perfect, toes not "found wanting," plumage, colour of legs, and comb first-rate. I am perfectly aware that "cross breeds" are not in general approved of, neither ought they to be, as it is a well known fact that chickens bred from two cross-bred parents are almost worthless, but I have known first-rate "pointers," the ancestor of which several generations before was a "fox-hound." Now, in the same way, why may not a little cross-breeding in the poultry-yard be beneficial? Might we not by so doing unite the several peculiar qualifications of two or three breeds in one? If so, I hope these few words will not be considered out of place, although written by *A Mongrel.*

Calendar of Operations.

JULY.

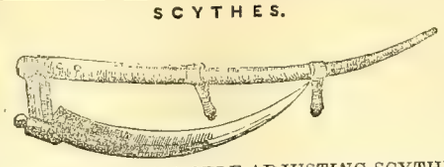
WEST SUSSEX, *July* 4.—It is with pleasure that we have to state that the crops have improved since our last report—the Wheat especially, which at present promises to be a good crop. There is a little rust upon the straw, but not to an extent to cause any fear. Barley grows well now, and is generally out in ear where it was sown in good time; but it is still very uneven, and the latest, though the lightest crop, may be the best sample. Peas are as fine a crop as could be looked for; there has not been the slightest appearance of blight in them, and what were sown from the 1st to 13th of February are now in part well filled, and the pods heavy; they are likely to come to harvest before the Wheat. Beans are also a very fine crop where the land is anything like good, and I think have seldom shown a more promising appearance; the podding is now begun in them, but they may yet turn out very different from what we expect, as they, being so much a later crop, cannot be yet said to be safe. The Potatoes have not got worse, but have rather recovered since our last, and we are yet looking for a good crop. Turnip sowing is now in most cases far advanced, and in many finished; and with us they look very healthy, although they have not grown so fast as we could have wished; but the weather has not been settled in temperature, not having had much heat, although we have had frequent and seasonable showers. The hay crop has turned out very light, but has been got in in good order so far as it is done; but there is still a good deal of meadow Grass to cut. All stock is doing well, and lean cattle are very dear; they were so when the Grass was scarce, and they have gone on advancing since we had more favourable weather for it. The hands are now employed at hoeing the Mangold, and will be about the Swedes in a few days, as they are now being horse-hoed. *G. S.*

Notices to Correspondents.

BREEDING HORSES: *Anon.* The word "degeneration," to which you refer, should have been "regeneration," as the expected result of the plan Mr. Spooner recommended. See p. 429, col. *a*, line 12.

WHEAT: *M W.* Triticum æstivum includes but one variety that we know—the red, bearded April Wheat. Spring and winter Wheat should not be sown together—they will ripen at different times. Other answers next week.

SCYTHES.



BOYD'S PATENT SELF-ADJUSTING SCYTHE will last out three of the ordinary sort, and is always ready for use.

"We have seen this Scythe at work, and can strongly recommend it."—See *Mark Lane Express*, May 16, 1853.

To be had of every Ironmonger and Nurseryman in the kingdom; and wholesale and retail of WM. DRAY AND CO., Agricultural Implement Makers, Swan Lane, London.

DRUMMOND'S REAPING SCYTHES.—Farmers and others intending to use this excellent Corn Scythe during the coming harvest, will please supply themselves without delay, and thereby prevent the disappointment that was experienced last year, through the inability of the Subscribers to overtake the execution of orders received late in the season.

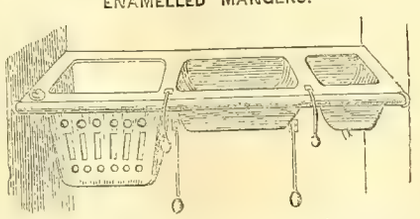
Price of a single Scythe	...	...	11*s.* 6*d.*
Ditto of three, package included	...	...	32 6
Ditto of six, ditto ditto	...	...	60 0

Carriage paid to London, Liverpool, Hull, Birmingham, &c.

W. DRUMMOND & SON, Seed and Implement Warehouse, Stirling, N.B.

☞ Orders from unknown correspondents must be accompanied with a remittance, otherwise they cannot be attended to.

BARTON'S PATENT STABLE FITTINGS, AND ENAMELLED MANGERS.



THESE FITTINGS have all the newest improvements and are the only patented invention of this description. Also Improved Stable Fittings with Rack, Manger, and Water Trough attached, New Pattern Manger and Water Trough combined; Corner and Straight Mangers, Plain, Enamelled, and Galvanised; Stable Furniture of every description, Iron Gates, Railing, Hurdles, Sheep and Game Wire Netting, Registered Poultry Troughs, Fountains, Feeders, &c.—JAMES BARTON, IRONFOUNDER, SMITH, &c., 370, Oxford Street, a few doors east of the Pantheon.

BALANCE OF FACTS IN FAVOUR OF RICHMOND AND CHANDLER, who have, in competition with the best selected CHAFF CUTTERS of the most celebrated makers in the trade, carried off the highest prizes against all comers.

COPY OF TESTIMONIAL.

"Early Court, Reading.

"GENTLEMEN,—I beg to hand you a cheque for your Corn Crusher; I must add, at the same time, that nothing can exceed the goodness of the Machine. I have found in it all I can wish, and, moreover a very superior finished Machine, and a pattern for other makers. (Signed) "GEO. SHACKELL.

"Messrs. RICHMOND & Co."

Address—RICHMOND & CHANDLER, Manchester; and South John Street, Liverpool.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

SAMUELSON'S IMPROVED

GARDNER'S TURNIP CUTTER.

MR. SAMUELSON having purchased the late Mr. GARDNER'S Works, has made it his study to maintain the quality of this valuable implement, more especially of the Knives, which are unequalled by the numerous imitations which have been attempted. Since the last meeting of the Royal Agricultural Society, a valuable addition has been made by Mr. Samuelson to the original GARDNER'S TURNIP CUTTER, viz., a screening apparatus, which separates the dirt from the cut roots, thereby preventing Scouring in the Sheep and Lambs.

CHAFF-CUTTERS, CORN-CRUSHERS, and Food-preparing Machines of every description.

SAMUELSON'S IMPROVED BUDDING'S LAWN MOWER, American and Atmospheric Churns, &c.

SAMUELSON'S PATENT FORKING, or DIGGING MACHINE.

Upwards of seventy of these Machines are already at work in various parts of England, the Continent, the Sugar Colonies, and Australia, and the number is daily increasing. It is now an acknowledged fact that by the use of the Forker the advantages of hand-digging can be obtained at a tithe of its cost, and a tilth has been got with it this season when the ground was in such a state that no combination of the ordinary implements could have accomplished it. For all Crops requiring a deep or a fine seed bed, nothing can equal the operation of the Forker.

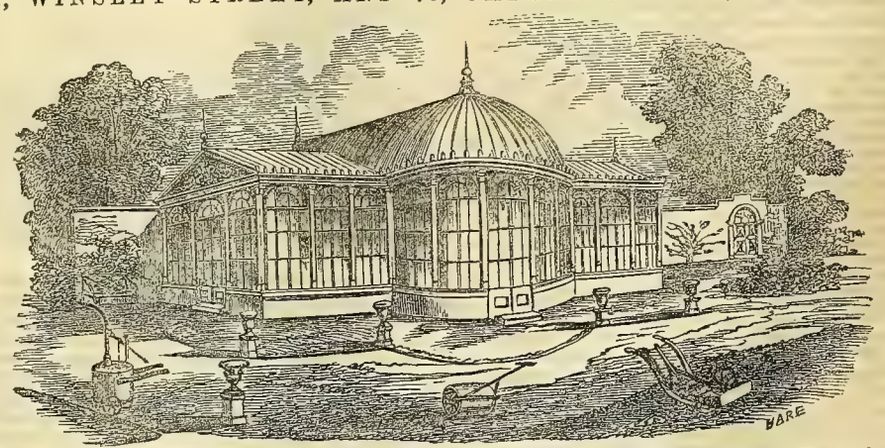
TESTIMONIALS from numerous Agriculturists of eminence who are using it, may be had on application.

B. SAMUELSON, successor to the late J. Gardner,

Britannia Works, Banbury; Stand No. 12, Royal Agricultural Show, Lincoln; and Stand No. 33, Agricultural Department at the Crystal Palace, Sydenham.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering

Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, ETC.

JAMES LYNE HANCOCK'S VULCANISED INDIA-RUBBER TUBING is now manufactured especially for the above purposes, and is of greater flexibility than any other description of hose or tubing. It is also manufactured to resist great pressure, suitable for attaching to the mains of water works or to tanks, or water butts of high elevations. WATERING HOSE fitted up with brass joints, branches, stop-cocks, roses, and jets complete. Vulcanised India-rubber suction pipes for pumps any length or size to order; HOSE for brewers' use, fire engines, &c. VULCANISED INDIA-RUBBER WASHERS, for Steam and Water Joints, and VULCANISED RUBBER in sheets of any size and thickness. Solid vulcanised India-rubber Tubing and Cord, for the joints of glass-doors, sashes, frames, &c.—Prices and every information may be had on application at the Manufactory, Goswell Mews, Goswell Road.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, HYDRAULIC ENGINEER, 70, Strand, and Bridgefield, Wandsworth.

WEIR'S IRRIGATORS, LIQUID MANURE PUMPS, FIRE AND GARDEN ENGINES.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London, removed from Oxford Street.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

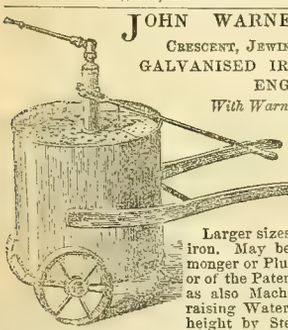
8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

JOHN WARNER AND SONS, CRESCENT, JEWIN STREET, LONDON.

GALVANISED IRON TUB GARDEN ENGINE,

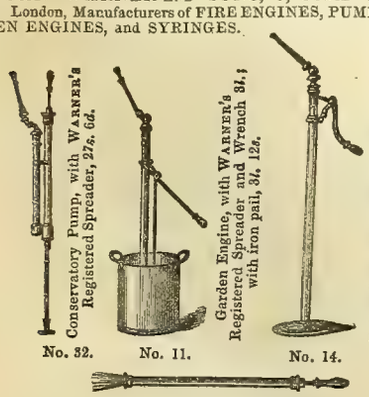
With Warner's Registered Spreader,



Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.



Conservatory Pump, with WARNER'S Registered Spreader, 27s. 6d.
Garden Engine, with WARNER'S Registered Spreader and Wrench 31.; with iron pail, 3l. 12s.
Patent Conservatory Pump, with WARNER'S Registered Spreader, 2l. 13s.; with iron pail, 3l. 5s.
No. 32.
No. 11.
No. 14.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain who on application will forward wholesale and retail prices.

THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

No. 11	16	,,	,,	40	,,	...	4 0
No. 12	24	,,	,,	45	,,	...	5 0
No. 14	30	,,	,,	45	,,	...	5 18

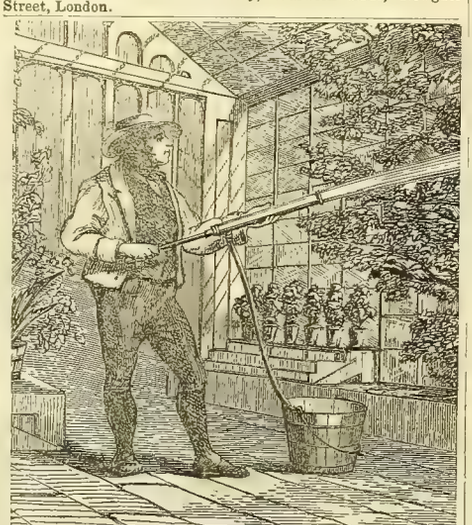
A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.



J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

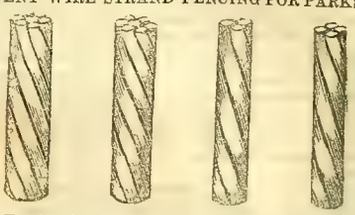
J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

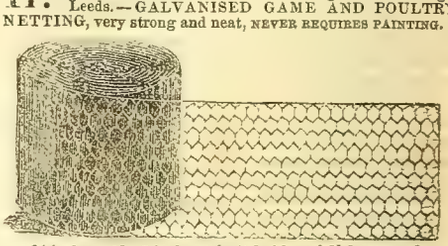
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

H. J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.

24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.

GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.

Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening Pursuits, are invited to examine DEANE, DRAY, AND CO.'s extensive Stock of GARDENING and PRUNING IMPLEMENTS, best London-made Garden Engines and Syringes, Colebrook Dale Garden Seats and Chairs.

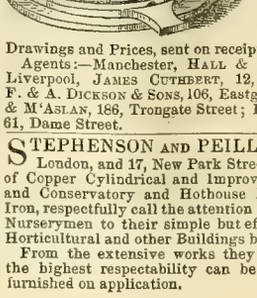
BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.



This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

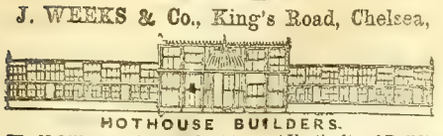
Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, F. & A. DICKSON & SONS, 106, Eastgate Street; Glasgow, AUSTEN & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

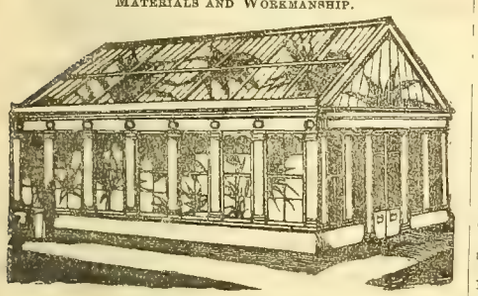
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

SOUND AND WHITE TEETH are not only indispensably requisite to a pleasing exterior in both sexes, but they are peculiarly appreciated through life as highly conducive to health and longevity. Among the various preparations offered for the purpose, ROWLAND'S ODONTO, or PEARL DENTRIFICE, stands unrivalled in its capability of embellishing, purifying, and preserving the teeth to the latest period of life. Prepared from Oriental herbs with unusual care, transmitted to this country at great expense, it will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, and thus fix the teeth firmly in their sockets; and from its aromatic influence imparts sweetness and purity to the breath.—Price 2*s.* 9*d.* per box. Caution.—The words "Rowlands' Odonto" are on the label, and "A. ROWLAND & SONS, 20, Hatton Garden," engraved on the Government stamp affixed on each box. Sold by them, and by chemists and perfumers.

CLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

CLASS FOR CONSERVATORIES, GREENHOUSES, DWELLINGS, ETC.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

THOMAS MILLINGTON requests attention to his present prices of SHEET GLASS in 100 feet boxes.

JAMES PHILLIPS AND CO., Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

METCALFE AND CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—EMILY DEAN'S CRINILENE has been many years established as the only preparation that can be relied upon for the Restoration of the Hair in Baldness from any cause, preventing the Hair falling off, strengthening weak Hair, and checking Greyness, and for the production of Whiskers, Moustachios, Eyebrows, &c., in three or four weeks with certainty. It is an elegantly scented compound, price 2*s.*, and will be sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37 A, Manchester Street, Gray's Inn Road, London. At home daily, from 11 till 7, Sundays excepted —"I have used your Crinilene, and have now a good pair of whiskers." J. L. HIGGS, Dudley.—"It has certainly improved my hair." J. THOMPSON, Durham.—"It effectually checked the greyness." L. EDE, Bath.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.? If so, use Miss GRAHAM'S NIOUKRENE, the most efficacious Hair generant ever introduced. It reproduces the Hair when lost either by disease or decay, prevents its falling off, effectually checks greyness, strengthens weak hair, and is guaranteed to produce those attractive ornaments, Whiskers, Moustachios, Eyebrows, &c., in three or four weeks. For nourishing and beautifying the hair, and sustaining its curling powers in all weathers, it has no equal. Price 2*s.*, and sent post free to any part of the kingdom, on receipt of 24 penny postage stamps, by ELLEN GRAHAM, 3, New Road, Hornsey, Middlesex.—"My hair is quite restored." Miss ORME.—"I have a full pair of Whiskers, thanks to Nioukrene." H. ROBB, Esq.—"It has checked the greyness." MRS. JONES.—"My hair is restored." DR. COFFIN.

HOLLOWAY'S PILLS AN EFFECTIVE MEDICINE FOR EPILEPSY AND APOPLECTIC SYMPTOMS.—Mr. Smithson, a retired publican, residing at Arbour Terrace, Norwood, who was of a very full habit of body, suffered to a fearful extent from an overflow of blood to the head, giddiness, and every symptom of Apoplexy; so bad at times that it was considered un-safe to trust him alone. His medical attendants failed to do him any good; therefore, as a last resource, he began to take HOLLOWAY'S PILLS, which he continued regularly for several weeks, and they have been the means of restoring him to sound health, feeling now as light and buoyant as a youth.—Sold by all Dealers in Medicine; and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

BLAIR'S GOUT AND RHEUMATIC PILLS. Price 1*s.* 1½*d.* and 2*s.* 9*d.* per box.—Mr. William Courtney, of Barton, Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon upon suffering humanity as that of Blair's Gout and Rheumatic Pills, they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "THOMAS PROUT, 229, Strand, London," is impressed upon the Government stamp.

FARM AND RESIDENCE.

WANTED to Rent, upon Lease sufficiently long to admit of a considerable outlay, 400 or 500 Acres of ARABLE LAND, with a superior FAMILY HOUSE. The situation must be agreeable, and within two hours' communication of London, and two miles of a first class station. The South or West of London would be preferred.—For terms and particulars, address to Mr. HEWITT DAVIS, 3, Frederick's Place, Old Jewry, London.

LODGE FARM, BLECHINGLY, SURREY.

TO BE LET, from Michaelmas next, with the Sporting thereon, all that conveniently arranged Farm called the LODGE FARM, situate at Blechingly, Surrey, within an easy distance of the Reigate and Croydon Markets. The Farm comprises a Farm House and compact out-buildings, all in good repair, and 194 acres of land, well farmed and in good condition, of which about 30 are pasture.—To view the Farm, apply to Mr. JAMES EDWARDS on the farm, and for further particulars, of Mr. JAMES WICKENS, No. 1, Chandos Street, Cavendish Square, London.

NURSERY AND SEED BUSINESS.

ESTABLISHED IN THE YEAR 1819.

TO BE LET, with immediate possession, the old-established NURSERY at Taunton, Somerset, for some time past in the occupation of Messrs. Macintyre and McIntosh. The Grounds and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required, the quantity of ground may be reduced.—For further particulars, apply to Mr. JOHN MCINTOSH, Lone Bridge, Taunton; or to Mr. YOUNG (the proprietor), Elm Cottage, Taunton.—July 8.

BLACK COCHIN EGGS from the best birds in England, having always taken prizes at the best shows, at 18*s.* per dozen, including package. Apply at the city of London Wire Works, 44, Skinner Street, London. N.B. Fowl Houses, Chicken Coops, Poultry Hurdles, and Netting, of every size and description. Illustrated Catalogues forwarded, post free, on application. A few Spanish Pullets, sisters to those sent to her Majesty's yard at Windsor, for Sale.

BEES.

TO BE SOLD, Three Hives of BEES, last year's swarms, strong and healthy. The Hives are constructed upon an entirely new and improved principle, and each one worked with seven glasses on the top. Bees now working in the glasses. No Bee-house required Any lady or gentleman wishing to inspect them will be kind enough to write previously —Address M. HAYES, Bee-hive Maker, Enfield Highway, Middlesex.

MR. JONAS WEBB begs to inform the public that his TWENTY-EIGHTH ANNUAL SHOW of SOUTH-DOWN RAMS will take place on THURSDAY, July 13. The Sheep will be let or sold as usual, and may remain on the Farm until required by the purchasers. Conditions of his Sheep letting may be had on application. J. W. will forward all Sheep half way, and those let at 20 guineas and upwards will be sent free to any Railroad Station at which they may be required, and their carriage back will be paid by J. W. Whittlesford Station, on the Eastern Counties line, is two miles from Babraham, and, by permission, all trains will on that day stop at Whittlesford, where conveyances will be in readiness to meet them.

P.S.—J. W. will have no Sheep at the Lincoln Meeting of the Royal English Agricultural Society, as he does not intend to exhibit there.—Church Farm, Babraham, Cambridgeshire.

ORCHIDS.

THE MOST EXTENSIVE AND VALUABLE COLLECTION EVER OFFERED FOR PUBLIC SALE, CONTAINING FINE PLANTS OF ALL THE BEST SPECIES OF THIS ELEGANT TRIBE NOW IN CULTIVATION.

MR. J. C. STEVENS is instructed to announce for Sale by Auction, at his Great Room, 38, King Street, Covent Garden, on WEDNESDAY, 12th July, and following day, the Collection of ORCHIDS of a gentleman, the character of which will at once be understood by an enumeration of a few of the principal varieties. Vanda suavis (true), four plants, Cymbidium eburneum two plants, Aerides Larpentæ two plants, Saccolabium Blumei eight plants, Lælia purpurata two plants, Phalænopsis rosea, grandiflora and amabilis many plants, Cypripedium Lowi, Uropedium Lindeni, and all the best varieties of Aerides, Vandas, Saccolabiums, Cattleyas, Trichopilias, Calanthes, Lælias, Dendrobiums, Angræcums, Miltonias, &c. Catalogues are preparing.

STRATFORD ST. MARY, NEAR COLCHESTER.

GARDEN GROUND AND COTTAGE RESIDENCE.

MESSRS. SMITH AND WARD will sell by Auction, on TUESDAY, July 11, at 4 P.M., at the Swan Inn, Stratford, Five Acres of superior FREEHOLD GARDEN GROUND planted with Fruit Trees, &c., and cultivated for the last eight years to a considerable depth, with Cottage, Barn, and other Buildings complete. Situated in the village on the Turnpike from Colchester to Ipswich, and 3 miles from Ardleigh station. Particulars of Messrs. Barnes and Neck, Solicitors, and of the Auctioneers, Colchester.

DOWN COTSWOLD RAM LAMBS.

MESSRS. GODWIN AND SON are instructed by Mr. J. T. Twynam to offer for Sale by Public Auction, at the Corn Exchange, Winchester, on MONDAY, July 17, at 2 o'clock precisely (the day previous to the Great Overton Hampshire Lamb and Sheep Fair, about Forty prime RAM LAMBS, and Three Four-teeth RAMS, of the above valuable breed, now so rapidly rising in public favour. These Lambs are of great size, of one uniform brown or dark colour of face and legs, and possess the most complete amalgamation of the Down and Cotswold symmetry, fleece, and flesh. The sire is (chiefly) Mr. Druce's (of Ensham, Oxford) No. 7 Down Cotswold Ram, a sheep of beautiful mould and thick flesh; the dams descended from the well-known flock of Down Cotswolds, established by Mr. J. T. Twynam, at Whitchurch, in 1835. Mr. Druce's wethers took the first prize at Smithfield at the last Christmas Exhibition for Crossed Sheep, in class 23. Winchester offers every facility and convenience for gentlemen and dealers who intend visiting the Fair at Overton on the following day.—The Lambs can be seen and particulars obtained on application to J. P. TWYNAM, North Walls, Winchester.

MR. FREDERICK MORRIS begs to announce that he has received instructions from the Trustees to Sell by Auction, without the least reserve, on MONDAY next, July 10, and five following days, commencing each day at 11 o'clock, on account of the number of lots, the extensive and superior stock of very choice and valuable HOTHOUSE and GREENHOUSE PLANTS, and IMPLEMENTS of the TRADE, of Mr. Griffin, at the Victoria Nursery, Weston Road, Bath, embracing the whole of the MOVEABLE STOCK, which is very extensive, and of a most valuable description, comprising upwards of 1300 Lots, and including about 300 fine specimen Azaleas, and 700 smaller do.; 1000 superior Camellias; 200 choice Heaths, and 500 smaller do.; 200 Epacris, 1000 Fuchsias, 2000 Geraniums, 50 Cactus, 100 Gardenias; 200 Roses, in pots; 500 Vines, 1000 Araucarias, and other Conifers, and many new and select hardy Shrubs, in pots; 100 Carnations and Picotees; 4000 hardy Herbaceous Plants, in pots; 18 Cucumber Frames, of various sizes; 10,000 Garden Pots and Pans, Wheelbarrows, Watering Pots, Syringes, and a large and extensive variety of all kinds of Hothouse and Greenhouse Plants of every description, which are arranged in small and suitable lots for private individuals. The Plants are all named and lotted, and will be on view on Friday and Saturday preceding the sale, when Catalogues will be ready, at 6*d.* each, on the Premises; at the White Lion, Bristol; Mr. G. MORRIS'S, 70, Tottenham Court, Road, London; and at the Auctioneer's Upholstery Warerooms, 22, Milsom Street, Bath.

TO GARDENERS.

NOTICE.

BERDOE'S VENTILATING WATERPROOF LIGHT OVER-COATS resist any amount of rain, without confining perspiration, the fatal objection to all other waterproofs, air-tight materials being unfit and dangerous for clothing, and being free from vulgar singularity are adapted for general use equally as for rainy weather. Price 45s. and 50s. A large stock for selection. Also of Capes, Shooting Jackets, Ladies' Mantles, Habits, &c.—W. BERDOE, Tailor, &c., 96, New Bond-street, and 69, Cornhill (only).

THE CHOLERA—ITS BEST ANTIDOTE.

SIR W. BURNET'S DISINFECTING FLUID, the original and genuine CHLORIDE OF ZINC.—Sold by all Chemists, Druggists, and Shipping Agents; and at the Office, 18, Cannon Street, London Bridge.
N.B. Beware of a spurious and low-priced imitation.

THE COMFORT OF A FIXED WATER CLOSET for 1l.—Places in gardens converted into comfortable water closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1l. Indispensable for the health and comfort of a family. Hermetically sealed Inodorous Chamber Commodes, 1l. 4s., 2l. 6s., and 3l.; also, Improved Portable Water Closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE and Co.'s, removed to more commodious premises, at 46, Leicester Square, London.

COWS.

HARVEY'S CELEBRATED COW DRINKS, 1s. each. They have been used with unparalleled success in most diseases incidental to Cows. Full and plain directions are given with each drink for the treatment of Hoven, Mawbound, Colds, Gargle, Red Water, the Tick or Foot and Mouth Distemper, at and after Calving, &c. A very extensive use of these drinks has proved them to be a safe and effectual remedy.
Compounded by R. HARVEY, Veterinary Surgeon, Macclesfield, Cheshire, and sold by all Medicine Vendors. Wholesale Agents, BARCLAY & SONS, Farringdon Street; and MARSDEN & SONS, Queen Street, Cheapside, London.

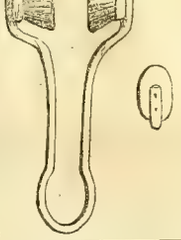
IMPORTANT TO STOCK FARMERS, AND FLOCK MASTERS.

SHEEP, LAMBS, HORSES, AND CATTLE,
CAN BE DRESSED WITH

LONG'S NON-POISONOUS SHEEP & CATTLE-DRESSING COMPOSITIONS, without any possibility of danger or injury resulting from the application. These Compositions are admitted by all who have fairly tested them to be the most effective Sheep Dressings ever brought before the agricultural public; and as they are NON-POISONOUS, and do not stain or discolour the Wool, they are gradually superseding the use of all Dipping and other Sheep-dressing preparations, composed of such deadly poisons as ARSENIC or MERCURY.
It is a fact now thoroughly established, that Long's Non-Poisonous Sheep Dressings, if liberally and judiciously applied in the dressing of Sheep and Lambs, will—in their consequent effect in removing Disease, destroying Vermin, and keeping the flock in condition—thus PROMOTING INCREASED GROWTH BOTH OF MUTTON AND WOOL—as amply repay flock owners for first outlay as artificial manures when applied to land. They are the only Sheep Dressings also, which, from the fact of their containing NO POISON, can be beneficially and safely applied to Sheep and Lambs at any age and at any season of the year.
Pamphlets containing full directions for use, and copies of the strongest Testimonials ever accorded to a manufacturer, signed by leading and practical Stock Farmers, residing in all parts of the United Kingdom, together with the names of all Country Agents authorised to vend Long's Patent Sheep and Cattle-dressing Compositions, may be obtained gratuitously on application of any advertised country Agent; or by post, sent free, of
BARRY BROTHERS, AGENTS FOR JOSEPH LONG,
Meriton's Wharf, and Shad Thames, London.

IMPORTANT TO GROWERS OF ROSES.

NEWLY-INVENTED APHIS BRUSH, OR GREEN FLY DESTROYER.—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the Rev. E. S. BULL, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage. Price 2s. 6d. each, or free by post, 4s.



MANUFACTURED BY
JOSLIN AND SONS,
IRONMONGERS, Colchester.

Retailed by all the principal Ironmongers.
Wholesale agents: W. Thompson and Son, 15, Upper North Place, Gray's Inn Lane Road, London.

PROTOXIDE ANTI-CORROSION PAINT, for all external purposes, on iron, wood, brickwork, or stucco, is cheaper, and more durable, than any similar article.—Manufactured by CHARLES FRANCIS & SONS, Cement Works, Nine Elms, London.

PAGE AND CO.'S COMPOSITION FOR THE DESTRUCTION OF MILDEW UPON VINES, BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, AND STOVE AND GREENHOUSE PLANTS.—Extra strong, 4s. per gallon, sufficient to make four (jars and barrels extra); in bottles, 1s. 3d. and 2s. 6d. each. 10 gallons and upwards carriage free to London. Directions for use and copies of testimonials upon application. For testimonials see whole page *Gardeners' Chronicle*, March 11, 1854, describing the SATISFACTORY RESULTS derived from its use in cases of Vine Mildew, Thrip, Scale, Green Fly, Red Spider, Mealy Bug, &c., not only without injuring the most delicate flowers or foliage, but promotes a vigorous growth; it is highly appreciated at the Royal Gardens, Osborne Palace, the Royal Gardens, Claremont, and by the principal nobility and gentry in the United Kingdom.
Finest Grasses for Lawns and Parks, and every variety of Garden and Farm Seeds, at B. PAGE & Co.'s, Seed Merchants, Oxford Street, Southampton.

Do. Mr. Jones, Gardener to Lady C. Guest, for a Pine-apple (under FE.)

Small Silver, not Silver, to Mr. Bailey, Gardener to T. T. Drake, Esq., for a Providence Pine-apple.

Do. Mr. Chapman, Gardener to J. B. Clegg, Esq., for 1 Pine-apple (under FE.)

Do. Mr. Jones, Gardener to Lady C. Guest, for a Queen Pine-apple.

Bronze, not Small Silver, to Mr. Bray, Gardener to E. Lousada, Esq., for a Queen Pine-apple.

Do. Mr. Spencer, Gardener to Marquis of Lansdowne, for the same.

Do. Mr. Spivey, Gardener to J. Houblon, Esq., for the same.

Do. Mr. Turnbull, Gardener to Duke of Marlborough, for one Pine-apple (FE).

OMITTANCES.

Certificate to Mr. Mitchell, Bristol Gardens, for a dish of White Cherries.

Do. Mr. Marcham, Gardener to J. Smith, Esq., for a dish of Black Cherries.

PARIS UNIVERSAL EXHIBITION OF 1855.

NOTICE IS HEREBY GIVEN, that all demands for Space should be sent in by intending Exhibitors immediately, or at latest on the 1st August.

(By order) H. C. OWEN, Captain R.E.
Marlborough House, Pall Mall, London, July 13.

STANDISH & NOBLE'S Catalogue for the present season is now ready, and may be had by inclosing two stamps for postage.—The Nursery, Bagshot, July, 1854.

ROBERT PARKER, from Messrs. A. HENDERSON and Co's., begs to inform his Friends and the Public that he has taken PARADISE NURSERY of Mr. W. J. Pamplin, where he intends to carry on the business of Nurseryman and Seedsman; and assures them that all orders he may be favoured with will be executed with promptitude and care.
Paradise Nursery, Hornsey Road, July 15.

ORANGE JELLY TURNIP SEED.

PURCHASERS OF LARGE QUANTITIES will be supplied liberally, for cash payment, on application to Messrs. SUTTON AND SONS, SEED GROWERS, Reading, of whom it may also be had retail at same price as at Chester. Early orders will be first executed.

SUTTON'S IMPERIAL CABBAGE. — THE EARLIEST SORT IN CULTIVATION, large and fine flavour. This sort may be sown immediately without any risk of the plants running to seed. Price 1*s.* per ounce, post free.
JOHN SUTTON & SONS, Nos. 7 & 8, Market Place, Reading, Berks.

DRUMHEAD CATTLE CABBAGE PLANTS.

JOSEPH SHILLING, NURSERYMAN AND SEEDSMAN, Winchester, has a large Stock of the above Plants, which he will send by Railway at 3*s.* per 1000, package included.

THE QUEEN OR CAULIFLOWER CABBAGE.—The above Cabbage is of most delicate flavour, quite equal to the Cauliflower; very early, and requires good ground. The stumps left in the spring after the Cabbages are cut will reproduce Cabbages all the summer, so that persons growing this kind need not make more than one good bed in the year. It should be sown this month, and planted out in September.—1*s.* per oz.

LONDON MARKET CABBAGE.—Saved from a very choice stock. This kind is of larger growth than the Queen, and will do well for exposed situations.—1*s.* per oz.

The above sent free by post on the receipt of postage stamps or a post-office order.
JOSEPH SHILLING, Nurseryman and Seedsman, Winchester.

HARDY'S NEW EARLY DWARF CRYSTAL CABBAGE.

ABRAHAM HARDY AND SON, SEED GROWERS, Maldon, Essex, can with confidence recommend this as a superior kind, and warrants it to give entire satisfaction. One ounce will be sent to any address, post free, on receipt of 1*s.*, or postage stamps equivalent. Sow in July or August.

POTATO DISEASE.—PREVENTION BETTER THAN CURE.

HUGHES AND NEWBERRY, FRUIT AND VEGETABLE SALESMEN, Covent Garden, remind their friends that they have an IMMEDIATE SALE for any quantity or quality of POTATO. Present prices are, per cwt.:—Best ROUND 8*s.*; KIDNEYS, 11*s.* GRAPES, 3*s.* per lb.; PEACHES, 8*s.* per dozen. NEW APPLES in request.

N.B. Directions given for Packing Fruit. Potatoes may now be sent in flour barrels, or, if ripe, in bags.—July 15.

ROSES.

G. CLARKE respectfully invites the attention of lovers of Roses to his unrivalled Collection, extending over 10 acres of ground, which may now be seen in full bloom. Plants can be selected now and orders executed in the autumn.

Streatham Place Nursery, Brixton Hill, near London, four miles from London. The nearest and most pleasant route from the West End to the Crystal Palace.

ROSE NURSERIES, HERTFORD.

EDWARD PARKE FRANCIS will feel great pleasure in showing to any amateur, lady, or gentleman, who may honour him with a visit, his Collection of ROSES, grown on the MANETTI STOCK, which is pronounced by many of the largest Rose growers and practical amateurs to be the finest quarter of Roses yet grown on this stock. The plants budded last autumn are now strong, stout, bushy, and average 3 feet in growth. Samples of flowers may be seen at Mr. DENYER'S, 82, Gracechurch Street; and Mr. CLARK'S, 25, Bishopsgate Street.

WILLIAM WOOD AND SON beg leave to intimate that their extensive Plantations of ROSES are now coming into fine bloom, and will remain in perfection during the Rose season. Maresfield is distant from Lewes 10 miles, and Hayward's Heath 12, both of which places are Stations on the London and Brighton Railway, and from whence conveyances may be obtained.

NEW ROSES IN POTS.

W. J. EPPS, of Maidstone and Ashford, can now supply fine strong Plants of the following new ROSES. The Plants average from 10 to 20 buds, fit for immediate working.

W. J. E. can offer choice varieties, such as Queen Victoria, Egarie, Triomphe de Valenciennes, Standard de Marengo, L'Ergant Vere, Madame Campbell, Palais de Cristal, &c., at 30*s.* per dozen, or 2*s.* 6*d.* each.

LASTREA FILIX MAS VAR. CRISTATA, ATHYRIUM FILIX FŒMINA VAR. MULTIFIDUM.

ROBERT SIM begs to draw the attention of Growers of HARDY FERNS to these extremely beautiful and unequalled British varieties.

LASTREA FILIX MAS VAR. CRISTATA.—Fronds 2 feet long, pinnæ broadly multifid at their points, giving the whole plant an unique and very elegant appearance. Very rare. Fine young plants, 5*s.*, and larger 7*s.* 6*d.* each. Small do. by post, 3*s.* 6*d.* each.

ATHYRIUM FILIX FŒMINA VAR. MULTIFIDUM.—Fronds 2 feet long, pendant, the ends of the pinnæ so much multifid as to appear tasselled. Fine young plants, 5*s.* each.

They form elegant Conservatory Ferns also.

Carriage free to London. Post-office orders on Chiselhurst. Nursery, Foot's Cray, Kent.

THE NEW RHODODENDRONS OF ASSAM AND BOOTAN
EXHIBITED AT CHISWICK ON SATURDAY, JULY 8TH, BY MR. J. VEITCH, JUN., OF CHELSEA.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, beg to say that in consequence of some remarks having been made to them respecting the above, and other reports having been circulated, originating, as they have been given to understand, from the Exotic Nursery, Chelsea, and which they are sure can have no foundation, think it right to put the readers of this Journal in full possession of the facts—which are, that in the month of March of the present year, Mr. Veitch was in communication with Mr. Nuttal respecting the above Rhododendrons, and in a letter dated the 16th March, Mr. V. requested to have a single plant of the following varieties for inspection, which were accordingly forwarded to him, viz, Keysi, Nuttali, Kendricki, eximium, longifolium, lucidum, calophyllum, and Camelliæflorum; and no other plants have subsequently passed into his hands from Mr. Nuttal.

Messrs. E. G. H. & Son were quite aware of this circumstance at the time of purchasing, and that a few other plants had previously left the collection of Mr. Nuttal.

Wellington Nursery, St. John's Wood, July 14.

PATTERSON'S SCARLET NONPAREIL STRAWBERRY.

JAMES VEITCH, JUN., has the pleasure to inform the public that Mr. Patterson, Gardener to Baroness Wenman, of Thame Park, Oxon, has placed in his hands for distribution the stock of the above first-rate Seedling Strawberry, which, having been fully tested and exhibited, has proved to be of very superior excellence.

It was exhibited at Chiswick, on Saturday, June 3, and received the Silver Knightian Medal; it has also been submitted to Dr. Lindley, Mr. Marnock, and Mr. Thompson, all of whom report most favourably of its merits.

It is a *first-class forcing* Strawberry in character, intermediate between *its parents—Keens' Seedling* and *British Queen;* of the vigorous habit of the *former*, and fully one week earlier in ripening; and in the quality of its fruit *fully equal* in flavour, if not superior, to the latter. The fruit is of a large size and handsome shape, of a *bright red colour*, and with a remarkably high perfume.

Orders are now taking for strong plants to be sent out the first week in September on the following terms:—

100 Plants ... £3 | 50 Plants ... £2 | 12 Plants ... 12*s.*

Exotic Nursery, Chelsea.—July 15.

OSBORN AND SONS have the pleasure to acquaint the public that they are now prepared to send out the following new plants:—

OXYLOBIUM OSBORNI.

This beautiful new Oxylobe obtained the Large Silver Medal at the Chiswick Exhibition in June, 1853. From its graceful habit, and bearing its bright orange-coloured flowers in such abundance, it will, we have no doubt, become a general favourite. Price 10*s.* 6*d.* each.

LYSIMACHIA LESCHENAULTI.

An exceedingly pretty plant, with dense heads of pink flowers, raised from seeds received from the Neilgherry Hills; it is a most abundant bloomer, and easy of cultivation. It was awarded the second prize for new plants at the Regent's Park, June 1854. Price 5*s.* each.

PENTAS ROSEA.

A decided improvement on the Pentas carnea, having much darker coloured flowers. Price 3*s.* 6*d.* each.

The usual discount to the trade.

Fulham Nursery, near London, July 15.

TO GENTLEMEN, FLORISTS, AND OTHERS.

TO BE SOLD, about 200 Pots of the best exhibiting varieties of CARNATIONS and PICOTEES in cultivation, by name, now coming into bloom. Also choice collections of the best named Scotch Ranunculuses and Pinks.—To be seen at R. PARKER'S, Florist, Mayfield Road, Dalston.

THE GRAPE BLIGHT.

McADAM'S "COMPOSITION" (now used in the Royal Vineries), for the effectual prevention and cure of the Vine Mildew, is sold in 1 lb. packets, with printed directions, at 3*s.* 6*d.* each, sufficient for 18 gallons of wash.

DAWE, COTTRELL, & BENHAM, Seedsmen, London Agents, 36, Moorgate Street, City. It may be ordered through any respectable Nurseryman or Tradesman in town or country.

PAGE AND CO.'S COMPOSITION FOR THE DESTRUCTION OF MILDEW UPON VINES, BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, AND STOVE AND GREENHOUSE PLANTS.—Extra strong, 4*s.* per gallon, sufficient to make four (jars and barrels extra); in bottles, 1*s.* 3*d.* and 2*s.* 6*d.* each. Directions for application forwarded. Ten gallons and upwards carriage free to London.

For testimonials, see whole page of *Gardeners' Chronicle*, March 11, 1854, describing the SATISFACTORY RESULTS derived from its use in cases of Vine Mildew, Thrip, Scale, Green Fly, Red Spider, Mealy Bug, &c., not only without injuring the most delicate flowers or foliage, but promotes a vigorous growth.

From Andrew Toward, Esq., Royal Gardens, Osborne Palace.

"I have great pleasure to add my testimony to the efficacy of your Blight Composition, which has been used with great success upon Rose Trees much affected with the Green Fly."

From Frederick Malleson, Esq., Royal Gardens, Claremont.

"I find it answer the purpose in all respects for Walls, also the Green Fly and Brown Scale in the Houses.—May 9, 1854."

Finest Grasses for Lawns and Parks, and every variety of Garden and Farm Seeds, at B. PAGE & CO.'s, Seed Merchants, Oxford Street, Southampton (20 yards from the Railway and Docks).

COWS.

HARVEY'S CELEBRATED COW DRINKS, 1*s.* each. They have been used with unparalleled success in most diseases incidental to Cows. Full and plain directions are given with each drink for the treatment of Hoven, Mawbound, Colds, Gargle, Red Water, the Tick or Foot and Mouth Distemper, at and after Calving, &c. A very extensive use of these drinks has proved them to be a safe and effectual remedy.

Compounded by R. HARVEY, Veterinary Surgeon, Macclesfield, Cheshire, and sold by all Medicine Vendors. Wholesale Agents, BARCLAY & SONS, Farringdon Street; and MARSDEN & SONS, Queen Street, Cheapside, London.

THE

NEW RHODODENDRONS OF ASSAM AND BOOTAN.

COLLECTED BY THOMAS J. BOOTH, ESQ.,

And described in the "Magazine of Botany," by his Uncle, THOMAS NUTTAL, Esq., *of Rainhill, the well-known Botanist and Traveller.*

E. G. HENDERSON & SON

HAVE much pleasure in announcing that they have for Sale these, the most remarkable new species of RHODODENDRONS ever introduced into the country, many of which surpass those from Sikkim, discovered by Dr. Hooker. Amongst these brilliant discoveries from the Bootan Alps are the most wonderful-sized flowers, delicious fragance, and distinct colours of any that are known to exist in this the most gorgeous tribe of plants; and being combined with magnificent foliage, and distinct habit of growth, will render them indispensable, and a great acquisition both for the garden and conservatory.

The entire Stock of all these extraordinary species now growing (June 16, 1854) in the gardens at Rainhill have been purchased by them. The plants are fine, healthy, and robust. Many have been planted out in the open ground, and have proved quite hardy, with the exception of one or two slightly injured by late spring frosts.

They are now taking orders for six of the most distinct species, which will be dispatched as soon as the young growth of this season is sufficiently ripened for travelling. Full descriptions and prices may be seen on referring to the *Gardeners' Chronicle* of July 1, or in their

NEW CATALOGUE FOR 1854, NOW PUBLISHED,

and which will be forwarded post free on application.

Wellington Nursery, St. John's Wood, July 15.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITION AT THE GARDEN, JULY 8, 1854.

AWARD OF THE JUDGES.

THE FIRST LARGE COLD MEDAL.

1. To Mr. Williams, Gardener to C. B. Warner, Esq., F.H.S., for 20 species of Exotic Orchids.
2. To Mr. Speed, Gardener to E Ray, Esq., of Edmonton, for a collection of 20 Stove and Greenhouse Plants.

THE SECOND LARGE COLD MEDAL.

1. To Mr. Woolley, Gardener to H. B. Ker, Esq., of Cheshunt, for 20 species of Exotic Orchids.
2. To Messrs. Fraser, of Lea Bridge Road, for a collection of 20 Stove and Greenhouse Plants.

THE FIRST COLD KNIGHTIAN MEDAL.

1. To Messrs. Rollisson, of Tooting, for a collection of 20 Stove and Greenhouse Plants.
2. To Mr. Dods, Gardener to Sir J Cathcart, Bart., F.H.S., for a collection of 15 Stove and Greenhouse Plants.

THE SECOND COLD KNIGHTIAN MEDAL.

1. To Mr. Rhodes, Gardener to J. Phillpott, Esq., of Stamford Hill, for a collection of 20 Stove and Greenhouse Plants.
2. To Mr. Barter, Gardener to A. Bassett, Esq., of Stamford Hill, for a collection of 15 Stove and Greenhouse Plants.

THE FIRST COLD BANKSIAN MEDAL.

1. To Mr. Carson, Gardener to W. F. G. Farmer, Esq., F.H.S., for 10 species of Exotic Orchids.
2. To Messrs Veitch, F.H.S., for 15 species of Exotic Orchids.
3. To Mr. Peed, Gardener to T. Tredwell, Esq., of St. John's Lodge, Norwood, for a collection of 6 Stove and Greenhouse Plants.
4. To Mr. Carson, Gardener to W. F. G. Farmer, Esq., F.H.S., for a collection of 15 Stove and Greenhouse Plants.
5. To Messrs. Rollisson, of Tooting, for 10 varieties of Cape Heaths.
6. To Mr. Turner, F.H.S., of Slough, for a collection of 12 Pelargoniums.
7. To Mr. Ingram, Gardener to her Majesty, at Frogmore, for a collection of Fruit.

THE SECOND COLD BANKSIAN MEDAL.

1. To Mr. Ivison, Gardener to the Duke of Northumberland, F.H.S., for 10 species of Exotic Orchids.
2. To Messrs. Rollisson, of Tooting, for 15 species of Exotic Orchids.
3. To Mr. Over, Gardener to W. McMullen, Esq., of Clapham, for a collection of 6 Stove and Greenhouse Plants.
4. To Messrs. Fraser, of Lea Bridge Road, for 10 varieties of Cape Heaths.
5. To Mr. Gaines, F.H.S., for 12 Pelargoniums in 8-inch pots.

THE SILVER GILT MEDAL.

1. To Mr. Gedney, Gardener to Mrs. Ellis, of Hoddesdon, for 10 species of Exotic Orchids.
2. To Mr. Hamp, Gardener to J. Thorne, Esq., of South Lambeth, for a collection of 15 Stove and Greenhouse Plants.
3. To Mr. Taylor, Gardener to J. Coster, Esq., of Streatham, for 6 Stove and Greenhouse Plants.
4. To Messrs. Veitch, F.H.S., for Befaria æstuans.
5. To Mr. Peed, Gardener to T. Tredwell, Esq., of Norwood, for 10 varieties of Cape Heaths.
6. To Messrs. Veitch, F.H.S., for a collection of Variegated Plants.
7. To Mr. Maher, Gardener to J. M. Strachan, Esq., F.H.S., for 12 Pelargoniums, in 8-inch pots.
8. To Mr. Turnbull, Gardener to the Duke of Marlborough, for a collection of Fruit.
9. To Mr. Strachan, Gardener to K. B. Hill, Esq., of Bache Hall, Cheshire, for Muscat Grapes.

THE LARGE SILVER MEDAL.

1. To Mr. Over, Gardener to W McMullen, Esq., of Clapham, for 6 Stove and Greenhouse Plants.
2. To Messrs Veitch, F.H S., for a new species of Dipladenia.
3. To Mr. Roser, Gardener to J. Bradbury, Esq., F.H.S., for 6 varieties of Cape Heaths.
4. To Messrs. Veitch, F.H.S., for 12 Hothouse Ferns.
5. To Messrs. Rollisson, of Tooting, for a collection of Variegated Plants.
6. To Messrs. Veitch, F.H.S., for a collection of Tender Plants of fine foliage.
7. To Mr. Turner, F.H.S., of Slough, for 6 varieties of Fancy Pelargoniums.
8. To Messrs. Lane, of Great Berkhampstead, for 50 varieties of Cut Roses.
9. To Mr. Snow, Gardener to Earl de Grey, F.H.S., for a collection of Fruit.
10. To Mr. Barron, Gardener to J. H. Vivian, Esq., F.H.S., for Queen Pine-apples.
11. To Mr. Frost, Gardener to E. L. Betts, Esq., F.H.S., for Black Hamburgh Grapes.
12. To Mr. Fleming, Gardener to the Duke of Sutherland, F.H.S., at Cliveden, for do.
13. To Mr. Allport, Gardener to H. Ackroyd, Esq., F.H.S., for Muscat and Frontignan Grapes.
14. To R. Boare, Esq., of Spring Hill, Berks, for Muscat Grapes.
15. To Mr. Brown, Gardener to W. C Cartwright, Esq., of Aynhoe, for Peaches and Nectarines.

THE SILVER KNICHTIAN MEDAL.

1. To Mr. Roser, Gardener to J. Bradbury, Esq., F.H.S., for 6 Stove and Greenhouse Plants.
2. To Mr. Taylor, Gardener to J. Coster, Esq., of Streatham, for 6 varieties of Cape Heaths.
3. To Mr Woolley Gardener to H. B. Ker, Esq., of Cheshunt, for 12 Hothouse Ferns.
4. To Messrs Henderson, of Pine-apple Place, for a collection of Variegated Plants.
5. To Messrs. Rollisson, of Tooting, for a collection of Tender Plants of fine foliage.
6. To Mr. Gaines, F.H.S., for 6 varieties of Fancy Pelargoniums
7. To Messrs. Paul, of Cheshunt, for 50 varieties of Cut Roses.
8. To Mr. Munro, Gardener to the Earl of Clarendon, for 25 varieties of do.
9. To Messrs. Fraser, of Lea Bridge Road, for a collection of 6 Helichrysums.
10. To the same, for a collection of 6 Kalosanths.
11. To Messrs. Veitch, F.H.S., for Pleroma elegans.
12. To the same, for a collection of Lycopods.
13. To Mr. Marsh, Gardener to C. Leach, Esq , for Disa grandiflora.
14. To Mr. Chapman, Gardener to J. B. Clegg, Esq., F.H.S., for a collection of Fruit.
15. To Mr. James, Gardener to C. H. Leigh. Esq., of Pontypool Park, Monmouth, for Queen Pine-apples.
16. To Mr James, Gardener to the Lady Charlotte Guest, for do.
17. To Mr. Fleming, Gardener to the Duke of Sutherland, F.H.S., at Trentham, for Pine-apples and Grapes.
18. To Mr. Hill, Gardener to R. Sneyd, Esq., F.H.S., for a collection of Grapes.
19. To Mr. Haywood, Gardener to Sir G. Goodman, of Roundhay, near Leeds, for Black Hamburgh Grapes.
20. To Mr. Dods, Gardener to Sir J. Cathcart, Bart., F.H.S., for Grapes and Nectarines.
21. To Mr. Wright, Gardener to J. Elgers, Esq., Putney Heath, for Royal George Peaches.
22. To Mr. Ingram, for Begonia suaveolens rosea, and Begonia hybrida.

THE SILVER BANKSIAN MEDAL.

1. To Mr. Peed, Gardener to T. Tredwell, Esq., of Norwood, for 6 Stove and Greenhouse Plants.
2. To Messrs. Pamplin, of Lea Bridge Road, for do.
3. To Mr. Over, Gardener to W. McMullen, Esq., for 6 varieties of Cape Heaths.
4. To Mr. Gedney, Gardener to Mrs. Ellis, of Hoddesdon, for 12 varieties of Hothouse Ferns.
5. To Messrs. Henderson, of Wellington Road, St. John's Wood, for a collection of Variegated Plants.
6. To the same, for a collection of Tender Plants of fine foliage.
7. To Mr. Maher, Gardener to J. M. Strachan, Esq., F.H.S., for 6 Fancy Pelargoniums.
8. To Mr. Francis, F.H.S., for 50 varieties of Cut Roses.
9. To Mr May, Gardener to C. M. Northington, Esq., of Caversham, for 25 varieties of Cut Roses.
10. To Mr. Taylor, Gardener to J. Coster, Esq., of Streatham, for Kalosanths.
11. To Mr. Speed, Gardener to E. Ray, Esq., of Edmonton, for Erica Massoni.
12. To Messrs. Veitch, F H.S., for Oncidium sp.
13. To the same, for Impatiens Jerdon æ.
14. To the same, for Phlesia buxitolia.
15. To Mr. Carson, Gardener to W. F. G. Farmer, Esq., F.H.S., for a new species of Burlingtonia.
16. To Mr. Ivison, Gardener to the Duke of Northumberland, F H.S., for Grapes in pots, and a collection of Tropical Fruits.
17. To Mr. Burn, Gardener to the Hon. Col. Pennant, of Penrhyn Castle, Bangor, for Queen Pine-apples.
18. To Mr. Hayes, Gardener to the Bishop of London, for Providence Pine-apples.
19. To Mr. W. Davies, Gardener to T. W. Booker, Esq., F H.S., for Queen Pine-apples.
20. To Mr. Lydiard, of Batheaston, for a collection of Strawberries.
21. To Mr. Smith, Gardener to A. Anderson, Esq., of Streatham, for Black Hamburgh Grapes.
22. To Mr. Shrimpton, Gardener to A. J. Doxat, Esq., of Putney, for the same.
23. To Mr Frost, Gardener to Lady Grenville, F.H.S., for Muscat Grapes.
24. To Mr. Tillyard, Gardener to the Right Hon. the Speaker, F.H.S., for Elruge Nectarines.
25. To Mr. Munro, Gardener to the Earl of Clarendon, for Peaches and Nectarines.
26. To Messrs. Lane, of Great Berkhampstead, for Morello Cherries in pots.
27. To Mr. Monro, Gardener to Mrs. Oddie, of Colney House, St. Alban's, for a Victory of Bath Melon.

THE FIRST CERTIFICATE.

1. To Mr. Wilkinson, of Ealing, for 50 varieties of Cut Roses.
2. To Mr. Sage, Gardener to W. R. Robinson, Esq., of Acton, for 25 varieties of Cut Roses.
3. To Mr. Gedney, Gardener to Mrs. Ellis, of Hoddesdon, for Phalænopsis amabilis.
4. To the same, for Nepenthes Rafflesiana.
5. To Mr. Ingram, for a fragiant species of Sabbatia.
6. To Messrs. Veitch, F.H.S., for Whitlavia sp.
7. To the same, for Escallonia sp.
8. To the same, for Eschoitzia tenuifolia.
9. To Mr. Underhill, of Edgbaston, for a seedling Strawberry called "Sir Harry."
10. To Mr. Kitley, of Lyncombe Sale Nursery, Bath, for a seedling Strawberry, called "Carolina superba."
11. To Mr. Frost, Gardener to Lady Grenville, F.H.S., for an Egyptian Green-fleshed Melon.
12. To Mr. Williams, Gardener to C. B. Warner, Esq., F.H.S., for Citrons, Oranges, and Lemons.

THE SECOND CERTIFICATE.

1. To Mr. Carson, Gardener to W. F. G. Farmer, Esq., F.H.S., for Ornithanium striatulum.
2. To Messrs. Osborn, of Fulham, for Lysimachia Leschenaulti.
3. To Messrs. Henderson, of Pine-apple Place, for Stylidium macranatum.
4. To the same, for Begonia xanthina.

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

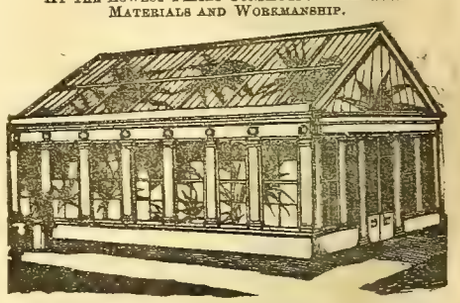
The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND DRMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS Millbank Street, Westminster.

STRAWBERRIES!

FOUR NEW AND DISTINCT VARIETIES.

NICHOLSON'S AJAX.—Very large and handsome, most exquisite flavour, unequalled as a dessert fruit, and forces well.

NICHOLSON'S RUBY.—Medium size, excellent quality, and an immense bearer, producing a succession of fine fruit for an unusually lengthened period; also a good forcer.

NICHOLSON'S CAPTAIN COOK.—A first-rate market fruit; colour, scarlet; very large size, great bearer, and bears carriage well. Plants remarkably strong and hardy.

NICHOLSON'S FILL-BASKET.—Nothing can surpass this fine sort as a market fruit; in colour it is a very bright scarlet; general shape round; gets very large, but never out of shape; excellent for preserving; a tremendous bearer, and will bear carriage a great distance. Plants very robust and healthy.

These splendid Strawberries have been admired by all who have seen them; the two first for their surpassing excellence as Dessert Fruit; the two latter for their size, colour, abundance, and other good qualities as Market Fruit. Gentlemen, Amateurs, and Market-Gardeners wishing to possess these valuable Strawberries can now be supplied with well-rooted Plants, by WILLIAM NICHOLSON, at 15*s.* per 100; or 25 each of any two sorts for 10*s.*, box included.

W. N. has had the honour of supplying the Royal Gardens at Frogmore with Plants, by direct order from H.R.H. Prince Albert. He has sent to all parts of England, Ireland, and Scotland; also America, Prussia, and France. Testimonials have been received from the principal horticulturists in the kingdom. Post Office Orders payable at Yarm, Yorkshire, or a Cash remittance required with the order.

Egglescliffe, near Yarm, July 15, 1854.

SPLENDID NEW RHUBARB.

SALT'S CRIMSON PERFECTION.

ROBERT SALT, GARDENER, Longton, Staffordshire will send out roots of this early, productive, and delicious variety of Rhubarb this autumn; see *Gardeners' Chronicle* June 11, 1853: "Very good, and most beautiful crimson; compared with others, it is remarkable for the small amount of acidity it contains."

A Certificate of Merit was awarded for specimens exhibited at the meeting of the London Horticultural Society, June 28, 1853; likewise a first-class Certificate at Nottingham Horticultural Society, May 24, 1854; and at the Midland do., May 25, 1854.

Single roots, 7*s.* 6*d.*, three for one guinea, and six for 21. Orders forwarded now to ROBERT SALT, or to HURST & M'MULLEN, 6, Leadenhall Street, London; Mr. Wood, Nurseryman, Coppice, near Nottingham; Messrs. Burgess & Kent, Nurserymen, Penkhull, will have the earliest attention. A Post-office order requested from unknown correspondents.—Longton, July 15.

PLANTS FOR THE WINTER.

CLARKE AND CO., SEEDSMEN AND FLORISTS, 86, High Street, Borough, London, have this season grown a large stock of the following Plants, the varieties of which are quite True and Choice Selected:—The Broccolies consist of late White Spring, Purple Sprouting, Bowles's Sulphur, Purple Cape Autumn, Victoria Early, White Spring, price 8*d.* per 100, or 5*s.* per 1000. Enfield Market Cabbage, Tall Scotch Kale, Drumhead Savoy, Green Curled Savoy, Early York Cabbage, Dwarf Scotch Kale, price 6*d.* per 100, or 4*s.* per 1000. Imported Brussels Sprouts, 8*d.* per 100, or 5*s.* per 1000. Drumhead Cabbage, 3*s.* 6*d.* per 1000. The Deptford Market Gardeners' sort of Red Solid Celery, pricked out plants, 1*s.* 6*d.* per 100.—Post Office Orders are respectfully requested to be made payable at the Borough Post Office.

CALCEOLARIA AND CINERARIA SEEDS.

GEORGE CLARKE begs to intimate that he has now ready for sale choice Seed of Calceolaria and Cineraria. The collection of Calceolarias from which the Seed now offered was saved forms an unrivalled one, and has been the admiration of all who have seen it; they possess every variety of colour peculiar to the genus, fine shapes, and have been awarded several first-class Certificates. Great care has also been taken in selecting the Cineraria from none but first-rate flowers; and, like the Calceolaria, it is warranted to give satisfaction.—Packets of both, 2*s.* 6*d.* each, will be sent on receipt of postage stamps to the amount.—Streatham Place Nursery, Brixton Hill, near London.

CINERARIA SEED.

EDWARD GEORGE HENDERSON AND SON, Wellington Nursery, St. John's Wood, London, are now prepared to forward, by post, new Cineraria Seed saved this season. More than usual care has been bestowed in gathering from the choicest named varieties, including the new ones sent out last year; all the light varieties have been discarded, consequently from the above seed we anticipate none but high coloured flowers. Per packet, 2*s.* 6*d.* and 5*s.* each.

Our beautiful collection of CALCEOLARIAS can now be seen in flower at the Nursery, and orders for seed booked, to be sent when ready. Per packet, first quality, 5*s.*; second quality, 2*s.* 6*d.*

The Gardeners' Chronicle.

SATURDAY, JULY 15, 1854.

IT has usually been remarked that the EXHIBITIONS at CHISWICK in the month of July are inferior to those in May and June; and it was anticipated that this would have been more especially the case in the present year, in consequence of the last show in the Regent's Park having been held only three days earlier. Never were visitors more agreeably surprised.

In the early part of the week the QUEEN had most graciously expressed her MAJESTY'S intention to honour the Horticultural Society with a visit, at Chiswick; and although the hour at which the QUEEN might arrive was not known till Friday last, yet the exhibitors were apprised of the Royal intention sufficiently early to enable them to express their sense of her MAJESTY'S great condescension by producing everything most rich and rare in their possession. The result was not merely a wonderful July exhibition, but one which for intrinsic interest has never been excelled, if equalled. And this was the more remarkable inasmuch as several of the greatest contributors to the Chiswick exhibitions were unable to be present with their plants.

In order that her MAJESTY and the Royal party might be secured against all possible risk of pressure from an eager crowd, stout barriers were erected round the tents, with numerous openings in them through which visitors could pass during the early part of the afternoon up to half-past 4. At that hour the tents were cleared, and remained so till the departure of the Royal party. But long before that time every barrier was lined by spectators anxious to secure good places for seeing; so that, although the line of barriers extended for nearly a thousand yards, it was difficult to pass through the openings provided.

At 25 minutes to 6 the QUEEN, accompanied by his Royal Highness PRINCE ALBERT, with their Royal Highnesses the PRINCE OF WALES, and PRINCE ALFRED, arrived, and was received by General FOX and other members of the Council, his Grace the Duke of DEVONSHIRE, the President of the Society, being unfortunately ill. Upon entering the tents her MAJESTY was pleased to accept at the hands of General FOX a magnificent bouquet, formed from the rarest flowers in the Exhibition. The Royal party then proceeded to inspect the exhibition tables passing along the whole line, and examining the varied objects as they presented themselves. The principal exhibitors, stationed within the barriers, had the satisfaction of remarking personally what degree of interest their stands excited. The large Conservatory was next visited, after which, having rested for a few minutes in the Royal Tent, her MAJESTY walked round the Arboretum, passing the great Poplar tree transplanted in 1853 by M'GLASHAN'S apparatus, in the presence of PRINCE ALBERT, and, visiting the ground near the orchestra, where the QUEEN paused to listen to the military bands, at 20 minutes to 7 her MAJESTY returned to her carriage, having previously been pleased to express her satisfaction at the "beautiful show."

And a most beautiful show it was—in every way worthy of being exhibited before the QUEEN. To the exhibitors themselves it must have been a day to be remembered with honest pride, for it was the first time that the QUEEN had visited in public any of those great horticultural exhibitions which are the summer glory of her metropolis, and on that occasion the exhibitors nobly sustained the reputation of their country for excellent gardening.

The brilliancy of Azaleas, and the exquisite beauty of Roses in pots having departed with the season, the plants exhibited were of a very miscellaneous description. Foremost, as usual, among the producers of novelty were Messrs. VEITCH & SON, who nearly filled one of the tents with an infinite variety of Orchids, variegated plants, Lycopods unrivalled for admirable cultivation, new shrubs, new annuals, and especially a most striking collection of Pitcher plants, partly consisting of Nepenthes and partly of Sarracenias, along with which was a capital specimen of the Venus' Flytrap (*Dionœa*), which, however, refused to perform its tricks even in the presence of the Sovereign. Among absolute novelties was a noble specimen of *Befaria æstuans*, a Rhododendron-like shrub from Peru; *Whitlavia*, a new hardy Californian annual, with dark violet bell-shaped flowers; a white *Escallonia*, from Patagonia; and the charming *Escholtzia tenuifolia*, quite different from the old species, dwarfer and neater. Next followed, as worthy rivals, Messrs. ROLLISSONS, of Tooting, and the two HENDERSONS, with grand displays of variegated and other plants. Nor were the Orchids and Pelargoniums inferior; for the collections of the first from Mr. WARNER and others, and of the second from Messrs. GAINES and TURNER, were universally admired. Her MAJESTY and the PRINCE examined Mr. GAINES'S "Fancies" with particular attention. Highly interesting as were all these, it is doubtful whether anything excited more notice than a very fine *Disa grandiflora*, a glorious terrestrial Orchid, which nobody can manage except Mr. LEACH, who produced it in perfect health and very fine flower, after three years' successful cultivation.

As to the fruit, we can only say that, if perhaps a larger quantity has been collected for display, there could not have been a more imposing exhibition of all that is excellent, with nothing indifferent to spoil the effect. Sixty-three exhibitors contended for the prizes, and a most difficult task it was for the judges to determine how they should be distributed. Sixty picked specimens of Pine-apples, 54 piles of Grapes, 30 dishes of Peaches and Nectarines, and 20 of Strawberries, together with less important fruits in abundance, sufficiently showed what fruit growers can do, even in a Cimmerian summer, when they choose to put forth their strength. The finest collection was produced from her MAJESTY'S garden at Frogmore; but the gardens of the Dukes of SUTHERLAND and MARLBOROUGH, the Earl of CLARENDON, the SPEAKER, and Mr. GLEGG, of Withington Hall, also furnished large supplies. Nor must we neglect to mention the wonderful beauty of a large dish of enormous British Queen Strawberries, sent by Mr. BATES, of Moulsey. Having arrived after the hour prescribed they could not be placed with the other fruit, but were stationed among the plants, where Mr. BATES will be glad to know that they were honoured by the particular examination of her MAJESTY.

The weather in the morning was wet and gloomy, but the sun appeared in good time to disperse the vapours, and the afternoon became brilliant and most enjoyable by the thousands who were present, and who will be long before they forget "the QUEEN'S day at Chiswick."

WE have just had an opportunity of examining two VINE HOUSES, which we think throw some light upon the subject of the disease which has lately been so prevalent in some parts of England. The Vines in the two houses are of various sorts, principally, however, Sweetwater and Black Hamburgh, and the one house some weeks later than the other. Not the slightest trace of disease is visible on any of the Vines trained to the roof of the house, except perhaps a slight pallid tint about the young laterals, to which, however, much importance cannot be attached; the leaves on other parts of the trees are quite as they should be, and the Grapes themselves without spot or blemish. In one of the houses, however, were about a dozen pots, containing Black Hamburgh and Sweetwater Vines, every one of which exhibited leaves covered on the under side with little green pustules. As the whole of the Vines planted in the border were healthy, it became a matter of interest to ascertain the state of the soil and roots in the pots, and on examination they proved to be badly drained; a large portion of the roots, indeed, were dead, in consequence of some former drought; the new roots were unhealthy, and the soil, though not absolutely waterlogged, in an unfavourable condition. What, therefore, we have suspected all along, seems to be verified, that in all those cases in which the leaves are deformed with pustules the root is the seat of evil, and that the remedy must be applied there.

The next point was to examine the structure of the excrescences on the leaves, which was impossible in the shrivelled bruised specimens previously submitted to inspection, and in every case it appeared that they were due to an hypertrophy of the epidermal cells of the under surface, at the expense of the spongy tissue above, by means of which the air is admitted into immediate contact with the walls, and is thus enabled to act upon the fluid which they inclose. The effect, therefore, must be, where the warts are in great abundance, to prevent the proper aëration of the juices, which, in consequence, return in an unhealthy, or at least in an imperfectly elaborated condition, and are unable to supply the exigencies of the fruit, which very naturally contracts disease, and ultimately decays. The cells of which the warts are composed contain only a few scattered grains of chlorophyl, and have apparently a very low degree of vitality, so that they soon become brown, and thus cause the spotted appearance which defaces the beauty of the foliage. It is not pretended that the spots upon the berries themselves are at all of the same nature as those upon the leaves, but rather that they are due to natural decay induced by the depraved state of the juices arising from the disease, which is so evident upon the foliage.

The spot in Geranium is, we doubt not, a case of quite a similar character, though we have not at present accurately compared the two maladies; and the disease so prevalent in Pear leaves may belong to the same category, though that is often accompanied by a minute Acarus; for it is possible that the Acarus may simply take up his abode in the pustules and not be chargeable with their first origin. It is not asserted to what particular condition of the roots the evil may be due, whether to the former drought, which caused many of the roots to perish, or to the subsequent ill-drained condition of the soil when charged with water, or to marked alternations of drought and moisture; but now that the probable origin of the evil has been pointed out, it would perhaps not be difficult, where there are sufficient opportunities of making experiments, to acquire some certain information on the subject. *M. J. B.*

VEGETABLE PATHOLOGY.—No. XXVIII.

126. WHEN seeds are placed in circumstances favourable to vegetation, as, for instance, where due proportions of warmth, moisture, and atmospheric air are co-existent, their water, whether free or combined, is decomposed, and the oxygen, combining with the carbon, produces carbonic acid. The absence of light, as tending to confine again the carbon, is in many cases, but not always, a necessary condition. So long as the carbon remains unaltered, vitality is apparently maintained. Meanwhile, their nutritive matter either becomes diluted or enters into new chemical conditions more easily transmissible by the tissues. Circumstances which favour these phenomena are promotive of vegetation, which, in some cases, would not take place at all, as in the case of long preserved seeds, unless conditions be presented

of more than ordinary efficacy. The simplest instance is the benefit derived from steeping seeds in water, in seasons when a constant supply of moisture can scarcely be expected, and similar ends are aimed at in the various chemical substances, especially such as liberate oxygen, which have at various periods been applied. Lime, for instance, which has a great affinity for carbon, has been employed with a view to set the carbon free from the starch into whose composition it enters. Old Spruce Fir seeds, which would scarcely germinate under ordinary circumstances, sprout readily when treated with lime, and in some cases diluted oxalic acid has been equally efficacious.* In some cases, where the integuments of the seeds are very hard, as of many tropical leguminous plants, it is found that submitting them for some minutes to the temperature of boiling water will favour their vegetation. It is, perhaps, difficult to say what is the exact temperature acquired in such a case by the vital portion of the seed, but it is quite certain that the vegetative powers of many seeds are retained at considerable temperatures. Malt, for instance, after being kiln-dried, has been known to vegetate; and it is matter of fact that the spores of the Penicillium, which, two or three years ago, was so injurious in many bakehouses and barracks in France, though submitted to a temperature equal to that of boiling water, in the centre of the loaf, were in a condition to vegetate as soon as the loaf was cold. Seeds, however, in general, will bear a high dry temperature better than a moist one. (A paper in "Annales des Sc. Nat." ser. 2, vol. 5, p. 5, by Messrs. Edwards and Colin, on the vegetation of cereals at high temperatures, may be consulted here with much advantage, and another by the same authors on the influence of temperature on germination, l. c., vol. 1, p. 257). Dr. Lindley mentions, in the "Theory of Horticulture," a case in which the seeds of Raspberries germinated after they had been boiled to make Raspberry jam, and we have ourselves witnessed a crop of Malaga Vines, some of which are now in cultivation after a period of twenty years, produced by the seeds of raisins which had been three times steeped in boiling water, after being thoroughly drained, and allowed to remain in the fluid till it became cold.

127. Though, however, such means have a tendency to insure a more rapid germination, and to diminish consequently the chances of decay, which might ensue under a more sluggish development of the embryo, no faith is to be attached to such theories as recommend the steeping of seed in liquid manures, with a view to insure a more vigorous as well as a more rapid growth. Such solutions, if exceeding a certain strength, are very likely to prove fatal, either directly or by stagnating in the tender cells; and the very small quantity which would be imbibed by the embryo previous to germination could have no great influence on the ultimate growth. The germination being once insured, artificial nutriment must be supplied by the spongelets, and even then, though the seed may have germinated readily, the nutriment may be present in too condensed a form to be consistent with healthy action, if death be not the immediate consequence, which is frequently the case where guano is injudiciously applied.

128. The embryo partakes not only of the nature of the plant which bears the seed, but if the impregnation have taken place from the pollen of some neighbouring plant of the same species, of that of the male parent also. The seed, therefore, even of a healthy, much less of an unhealthy plant, will not necessarily produce a healthy offspring. No part of agriculture, perhaps, requires attention more than the selection of seed, a point which is not sufficiently estimated by cultivators in general, who frequently suffer from ill-timed economy. The embryo may be sufficiently formed to vegetate, but not to produce a vigorous plant. A partial or complete state of chlorosis is often the consequence, and to this cause may frequently be attributed failures which are ascribed to season or other accidents, which are perfectly blameless. It is pretty certain, too, that the seed derived from plants infested with parasitic fungi is liable to reproduce the parasite with the young plant, however mysterious and inexplicable the matter may be. That particles, capable of generating fungi, do circulate with the juices, can only be denied by those who advocate the theory of equivocal generation, for thousands of facts concur in its proof. An instance of seeds derived from an infected parent, reproducing the original parasite, is recorded in the *Gardeners' Chronicle*, 1848, p. 716, with reference to the reproduction of Cladosporium orbiculatum, Desm., on the common Pyracantha.†

129. It is no less true in the vegetable than in the animal world that a race, when once impaired, can only be renovated by impregnation from a healthy stock. Attempts, therefore, to raise healthy Potatoes from the seed of diseased plants, are *à priori* likely to fail. If the disease, for instance, with which Cucumbers and Melons are affected, be independent of the peculiar characters of the season, which there is good reason to believe, there is every probability that the disease will not be mitigated so long as seed is carelessly selected from diseased races.* *M. J. B.*

* Cobbett's mode of treating seeds, as detailed by Loudon under Platanus occidentalis, securing at once the constant imbibition of moisture, though not such a saturation as in the absence of any means of preventing its stagnation would be sure to induce decay, together with complete aeration, is a step towards the same end, without the use of chemical agents.

† The plants of Pyracantha, which were infested with the Cladosporium, were all raised from Russian seeds. Many old plants of Pyracantha were in the same garden, but the disease was confined to the seedling bushes.

MODE OF CULTIVATING THE MELON IN CABUL.

A FRIEND lately favoured me with some Melon seeds that had just been received by the overland mail from India. They were stated to be the produce of one of the kinds of Melons that are most esteemed in Cabul, and to have been procured from thence by Henry Montagu Smith, Esq., of the Bengal Horse Artillery, who at the same time forwarded the following particulars, that had been communicated to him by a Cabul gardener, respecting the mode of cultivating the Melon in that country.

Trench the ground thoroughly 2 feet deep, 1 foot wide, and 6 feet apart. Water it well, and when half dry, dibble holes along the centre of the ground that has been trenched 2 inches deep, and a foot apart; into each hole, four seeds that have been well washed and dried are to be dropped and covered up. When the young plants are about 2 inches high, pull up three, and only allow the largest to remain. As soon as this plant has two leaves, and a central head or heart, the latter is to be cut off with a pair of scissors; and, about the same time, small holes must be dug all round the plant, but at some distance from it, and filled with well-rotted stable manure. When the plant spreads and its branches begin to bear fruit, cover up one fruit on each branch, when about the size of a Walnut, with a handful of clay, having first scraped out a little hole in the ground for it to sit in. The fruit selected should be the one nearest to the plant, which in most cases is the first on the branch that begins to swell, and generally becomes the largest and finest fruit. Water is given every tenth day.

The covering of the young fruit with clay in the manner directed appears to be an odd proceeding; but it is probably intended as a means of protecting the fruit in the early stage of its growth from the scorching rays of an Indian sun.

The Cabul Melons—such of them, at least, as were grown from the seeds that were introduced 10 or 12 years ago—are very similar to those of Persia, and are characterised, like them, by a thin delicate skin, of a golden yellow when ripe, either smooth or beautifully netted all over. The flesh is pale green, nearly white, very sugary, melting, and of delicious flavour. They require to be grown in a higher temperature than other Melons; and I presume it is partly from this not having been attended to, that the fruit produced in England, except in a few instances, has not merited the character, nor had any of the good qualities it was stated to possess in Cabul. I trust it may be otherwise with the fruit from these seeds. They were confided to the care of one of our best Melon growers, and in due time you shall know the result. *W. B. B.*

BEGONIA FUCHSIOIDES.

AMONG the many favourites of our plant houses, few are more deserving of attention than the Fuchsia-like Begonia. Its graceful habit, the brilliant colour of the flowers, the short time required to have plants in a blooming state, render it worthy of universal cultivation. To those with whom winter-flowering plants are in demand, this Begonia will be found indispensable, and when well grown and bloomed it cannot fail to be generally admired.

I aim at having the plant in flower the whole, or at least the greater part of the year; and to secure this, it is necessary to propagate at two different seasons. In the first instance, cuttings are obtained in the beginning of February, selecting young healthy pieces, such as are not over full of sap, and which are rather firm; these strike freely, inserted rather thickly around the sides of 5-inch pots, and plunged in a close warm frame where the bottom heat is about 75° or 80°. Any light sandy soil will answer. I generally use equal parts of silver-sand and leaf-mould, the latter passed through a fine sieve and thoroughly mixed with the sand. When the cuttings are well rooted, which will be the case in the course of a month, they should be potted singly in 5-inch pots, and replaced in the propagating frame, and if they can have the assistance of a gentle bottom heat all the better. When the pots become filled with roots, shift into 8-inch ones, and place the plants in a shady corner of the stove, or wherever it may be convenient, provided a temperature of from 60° to 65° is maintained, and a moist atmosphere kept up; but unless they occupy a shady situation, it will be necessary to screen them from the midday sun, as this species is rather impatient of bright sunshine; and if thus exposed, it loses that fine glossy appearance which the foliage presents when in vigorous health. When the pots become filled with roots, a little clear manure-water will be beneficial; and they should be syringed with pure water, morning and evening. By the middle of June they will require a final shift into 13-inch pots, and should be encouraged to make vigorous growth. With regard to stopping, they merely require to have any over-luxuriant shoot stopped, when it has attained the desired height, so as to regulate the flow of the sap, and induce the formation of lateral branches, upon which the flowers are produced. The stronger shoots should be supported by neat stakes, and tied out, so as to accommodate the side shoots which are to produce the flowers. Managed in this way they form fine bushy plants, commence blooming in October, and continue in flower till March, or even later, if kept in a temperature of 50° or 55°.

A second lot of cuttings should be got in about the beginning of July, and treated as the first, except that after the second shift, which they should receive in September, they may remain in 8-inch pots till February. During the winter they should occupy a situation near the glass, where the temperature may average from 50° to 60°. Early in February a portion of the plants may be shifted into 13-inch pots, after which a slight increase of heat will be essential to their well doing; but when subjected to a high temperature at this early season, they should receive all the light that it is possible to give them. As the plants progress in growth, they must receive attention in the way of stopping and tying, and when the pots become full of roots they should be watered frequently with clear manure. The remainder of the plants, if allowed to remain in their winter pots, and encouraged with a slight increase of temperature, will flower at an earlier period than those which occupy larger pots, or they may be left in a cool place until the middle of March, and then shifted to form a succession to those shifted in February.

This Begonia may be removed to a conservatory, when in flower, where it will continue to produce a constant succession of blossoms during several months; but unless the conservatory is treated something like an intermediate house, it will be necessary to place the plants in the warmest corner, and where they will not be exposed to currents of cold air; a situation where they can receive abundance of light, without being exposed to the direct rays of the midday sun, will be necessary, in order to have the flowers well coloured. After the blooming season is over, the old specimens may be thrown away, to afford space for young plants, which bloom more freely and produce fine trusses.

The soil best suited for this Begonia in all its stages is equal parts turfy loam, peat, and well decomposed cow or horse manure. The peat and loam should be carefully broken, and used in as rough a state as the size of the shift will allow; the dung should be carefully mixed with sharp sand previous to being mixed with the peat and loam; this tends to thoroughly separate any lumps, which otherwise would be sure to form a harbour for worms; the quantity of sand should be regulated according to the nature of the loam and peat, enough being added to secure perfect drainage, as this Begonia is somewhat impatient of stagnant moisture about its roots. *Alpha.*

* Cucumbers from foreign seed are equally affected with those of British origin. In the same frame I have, during the present season, had two varieties from Brussels, one resembling somewhat the White Turkey, called Bonneuil, and the other little superior to the old Sandy, named Concombre aux petits cornichons, together with an excellent variety derived immediately from seed raised at Florence, where it had been cultivated some ten or fifteen years. The two former have long since perished, while the latter has not produced a single Cucumber which has not either decayed from the tip, or proved withered and distorted above.

Home Correspondence.

Substitutes for the Potato.—I am glad to learn from your leading article that there is some chance of obtaining a new and sound variety of that now necessary production the Potato. I quite agree with you that all the nostrums for prevention or cure of the "Potato disease" have added nothing to our knowledge of this most serious evil. I have been for 40 years a close observer of the value and quality of the very numerous varieties of the Potato which have come under my notice, and at all times a grower of many different kinds of them. For more than 30 years I grew one kind of early Potato without perceiving any deterioration in its produce or quality. I hope your suggestion of obtaining the Solanum verrucosum from M. Pargues will be industriously attended to; and as it may not be generally known how to obtain flowers and seeds from the Potato plants which do not usually produce them, I beg to communicate a method I have successfully adopted for many years, for obtaining varieties of the earliest species. Plant a Potato very near the surface of the soil, which raise by covering it with a small quantity of mould round it, tie the stem up with a stick, or, better still, nail it up to a wall, and as the tubers form draw away the soil from them with the hand, and take them off frequently, and cover up the roots again, and blossoms and seeds will be produced. The Dioscorea japonica, from China, is also named as of probable value as a substitute for the Potato. *Thomas Landor Burton-on-Trent.*

Strawberry Culture.—The first year's produce o Strawberry plants from runners of the preceding season is generally considered of little account; but, with attention to certain points of treatment, I have reason t believe that it may be made nearly equal to the averag produce of the second year. I observed lately in th grounds of a market-gardener a bed of Keens' Seed lings, which he informed me were from runners of las year planted out at the end of summer. They wer bearing plentifully, though perhaps not carrying a heavy a crop as a neighbouring bed two years old, no were the plants, of course, so large and stocky. I hav myself some plants of another kind, the Roseberry, fro runners of last year, which have six and eight fru stems or trusses; and the aggregate amount of frui borne on these plants is quite equal to that on any the plants from which they were made, now two year old. The course I adopted in making these plants w this:—In June last year I laid down such runners as wished to make fresh plants from, removing all othe as they were thrown out, whether from the parent plan or from the rooted runners. In September the ne

rooted plants were detached from the old ones, and removed with a ball of earth to the place where they have since remained. The removal might, I presume, be as advantageously made at a later period—say in October or November—if the ground they are intended to be placed in should happen to be occupied at an earlier time with other crops. By paying attention to laying down a limited number of runners early, and concentrating the energies of the parent plant in causing them to form their roots, I consider that the constitutional maturity and bearing power of the new plants are materially forwarded, so as to enable them to produce a fair crop the next season, instead of having the ground almost uselessly occupied for a whole year with immature and imperfectly bearing plants, as must necessarily be the case when the beds are made in spring. *J. H. H., July 7.*

Genista cinerea.—In the arboretum here there is a magnificent specimen of this shrub, nine feet in height and about 36 feet in circumference, its branches densely clothed with innumerable racemes of golden yellow Cytisus-like bloom, and yielding a grateful odour throughout the later hours of the day. This is probably the finest of its kind in the kingdom. I have a note taken some years ago of a remarkable specimen of G. cinerea, at Dysart House Gardens, in Fifeshire, equal in height to the one now described, but much inferior in vigour and uniformity of growth. Its hardiness to withstand our severest seasons, and its graceful exotic-like aspect, well serve to distinguish it as one of the most ornamental of summer-flowering shrubs, and, without exception, the gayest object in the arboretum or shrubbery in the months of June and July. The formal figure of this species in Watson's "Dendrologia Britannica" conveys a very bad idea of its elegant and slender form, as it exhibits the silvery hue of its leafy verdure to the breeze. *W. Wood, Holdgate Nurseries, York.*

Edging Shears.—Why are clipping-shears, used for trimming the Grass edges of gravel walks and flower beds, made by manufacturers at right angles to the handles, instead of at an angle of about 45°? In this part of the country every gardener who knows his profession, immediately on obtaining a new pair, takes them to a blacksmith, and has the angle of the shears to the handles altered to about 45°, and when thus altered he can in the same time perform nearly three times as much work; a wheel at the heel of the shears makes no difference, for with or without a wheel the heel must be held off the ground to keep the point down, and give the shears the incline, so as to push forward. If this should meet the eye of a manufacturer he may possibly be induced to alter the angle. *J. G., Blandford.*

Packing Grapes.—I have been struck with amazement at the magnificent Grapes shown at Chiswick and Regent's Park, and more particularly with the beautiful rich bloom which was upon them. This I confess was beyond my comprehension; and why I now trouble you is, to ask some of your exhibiting correspondents how they manage so to pack them that not a berry is rubbed. I remarked that most of them were grown at a distance from London, but nevertheless they appeared as if they were grown on the spot. *Henry John White, Tadcaster.* [We are sure that some of the senders of the beautiful Grapes alluded to will gratify our correspondent.]

Gooseberry Caterpillar and Green-flies.—The extensive Gooseberry and Currant plantations of this neighbourhood (Pershore), are greatly injured by caterpillars and green-flies. White hellebore proves a valuable remedy for the former, but we can discover none for the latter. I have tried nearly every recommendation made in your back numbers for their destruction, but without practical benefit, and I should feel greatly obliged if you could give me any advice for the management of 60 or 70 acres of young bushes now suffering from their attack. A single washing or fumigation might be adopted if there were any certainty of its being successful; but there seems no hope of this being the case, and repeated applications would be too tedious and expensive in so large a plantation. [Repeated syringing with tobacco-water and clear water is certainly beneficial.] Taking off the shoots most infested with the fly and throwing them on the ground or burning them has little effect in retarding their progress now they are strongly established. Would it be effectual if vigorously adopted when they first appear? [Nipping off the young shoots infested is certainly a very serviceable remedy, especially if applied early.] Is the first brood of the season hatched on the trees from eggs deposited on the branches or buds the previous autumn, or do the flies mostly or even occasionally come from a distance? If the former, I would not object to washing the bushes when leafless with a composition to destroy the eggs, if any such be known as perfectly effectual; otherwise, I should prefer running the chance of the season. There are no other gardens near me, but of course there are brambles in the hedges, so my position is not perfectly isolated, but nearly so. [We do not think washing the naked branches in the winter would be a sure preventive, the eggs being so minute would, doubtless, for the most part escape the application, even if it were certain that the early broods are not the progeny of flies brought from other wild plants.] When the remainder of my land is planted, and the present trees more grown, any remedial measure will be more difficult and costly than now, and I would cheerfully encounter considerable expense if future safety could be secured. If the fly comes from a distance, I fear winter washing will have little effect. Can I with advantage encourage the lady-bird or any other insect, or even bird, that will feed upon the aphis, and not injure the fruit? [Encourage the lady-birds and the Syrphidæ as much as possible. It is certain that the inclement weather has not only retarded the appearance of these beneficial insects, but has been eminently favourable to the development of the aphides. The fly-catcher, hedge-sparrow, and even the common sparrow, should also be encouraged.] My bushes have not grown very vigorously, partly owing I suppose to the soil being an impoverished loam or marl, scarcely rich enough for them, although Apple, Pear, Plum, and Quince trees and Strawberries flourish in it most satisfactorily, and partly from their having had their leaves stripped off last year by the caterpillars. The ground is also exposed to the east. May either of these circumstances account for the fly being stronger on my plantation than on those which are older, more vigorous, and more sheltered? [It is certain, and at the same time remarkable, that cold east winds and exposure to the east, which are so detrimental to most insects, seem especially favourable to the development of aphides. We have a bed of Chrysanthemums at the present time in an exposed situation, sadly infested, whilst another bed sheltered by walls and trees is quite free from them.] Would the application of soot, guano, or any other portable manure tend to diminish the green-fly? and is it probable the bushes may be free from fly in more favourable seasons, if I do not adopt any of the expensive expedients alluded to; or must I consider it an evil which will increase if not vigorously and immediately encountered? *R. Varden.* [We think, on the whole, that nipping off the young shoots, and the application of liquid manure to force forward the vegetation as much as possible during the present season, will be the most likely means to benefit your trees. The season so far has been most anomalous, and cannot be regarded as affording a precedent for future operations. The trees in question are in general so little subject to the attacks of aphides that we would rather look on the present visitation as an exceptional one, not likely to occur again. *W.*]

Reappearance of Potato Blight in the North of Scotland.—This part of the country, which nearly escaped its attacks last year, of which the large quantities sent to the London markets gave proof, has this year been visited by the evil earlier than I ever have observed it in any former season, *i.e.*, on the 2d inst., and, although only just turned one week, it has been giving unmistakeable signs of its character; those infected are an early sort, growing on a south border, in the kitchen garden; and, consequently, not of extensive breadth. Judging, however, from its former virulence, and its already rapid progress, it may naturally be looked upon as a very bad omen for the fate of this season's crop, which, up to the present time, has seldom been equalled for luxuriance. The weather for the past three weeks has been wet and sunless, just suited for its extension. We fortunately escaped the late spring frosts here, which have been so destructive in the south. *J. Webster, Gordon Castle, July 10.*

Striking Cuttings.—The following are half a dozen general rules relative to the selection and preparation of slips or cuttings. 1st. Let all slips be cut off as near a joint as possible without injuring it. 2d. For autumn or winter make choice of well ripened firm wood. 3d. In spring or summer half ripened young shoots are best, as they strike quicker than old wood. 4th. All succulents, such as Cactuses, Geraniums, &c., should remain a few days to dry, until their wounds are closed up, before they are potted. 5th. Never allow cuttings to remain in water; if they cannot be planted immediately lay the ends in moist sand. 6th. In winter or summer always let a few of the leaves remain on evergreens. *A Gardener.*

Spiræa grandiflora.—We are happy to say that this Spiræa is perfectly hardy. The plants originally introduced are now growing in our nursery here, where they have been ever since their introduction in 1849. They have never had any protection whatever. The plants are 6 or 7 feet high, and as much through. Their general appearance is decidedly that of an Amelanchier; and it is only when examining the suckers that any resemblance to a Spiræa is perceived. *Standish & Noble.*

The Fruit Crop in France.—It is many years since they have have had such a heavy crop of stone fruit in France as that of this season; the Plum trees are breaking down with their loads, and there are enough Greengages for all Europe. But the most remarkable are the standard Apricot trees; these, all through France, from north to south, are so thickly covered with fruit as almost to hide the leaves, and in the fields, the trees that have not been attended to, by thinning the fruit, will be destroyed, owing to the heavy crop. In the environs of Paris, and south-west as far as Nantes, nearly all are Moorparks, and the fruit fine and large; but as they have had nothing but clouds and rain for the last two months, they are very backward. Ripe Apricots from Avignon and Marseilles have, however, been abundant in Paris the last fortnight. They are cheap—from 1 to 2 sous each—but tasteless and dry. Pears are in most places a good crop. Apples seem a failure in all the districts I have passed through, but they say there are good crops in some localities in Normandy. Cherries have been most abundant, but small and scarcely worth eating. On the railway to Versailles (*rive droite*) to the left in the fields by Puteaux and Suresnes, the Cherry trees by thousands were scarlet with fruit, and looked at a distance like groups of Poppies; many of them were not larger than Gooseberry bushes, yet all were laden. I found on inquiry that this sort is peculiar to the district, and the trees never grafted, but raised from suckers; it is like our Kentish Cherry in size and quality, but more dwarf, and a greater bearer, and is one of the numerous varieties known as Cerise de Montmorency. *T. R.*

Societies.

Horticultural, *July* 8: Garden Exhibition.—On this occasion fruit was more than ever abundant and excellent, and formed, as it always does in July, one of the most attractive features of the show. Pine-apples were numerous and generally handsome. Black Grapes were for the most part ripe, and well coloured; but as much can scarcely be said of Muscats and other white sorts, which, although in most instances ripe, wanted that fine golden tinge, which they, doubtless, would have acquired had the season been bright and sunny. They were generally, however, large and fine, both in bunch and berry. Peaches and Nectarines were very good, and there were some beautiful exhibitions of Plums (from Mr. Ingram), Cherries, and Strawberries. Melons were plentiful, but many of them did not appear to be ripe.

Collections of Fruit.—The best by far came from Mr. Ingram, gr. to her Majesty, at Frogmore. It contained a Cayenne Pine-apple, weighing 8 lbs.; Muscat, West's St. Peters, Black Hamburgh, and Royal Muscadine Grapes; large Early Apricots; very fine Bellegarde Peaches; beautiful Elruge Nectarines; Jefferson, Goliath, Washington, and Victoria Plums—all fine of their kinds; Elton Cherries, three dishes of Strawberries, and a Beechwood Melon. Mr. Turnbull, gr. to the Duke of Marlborough, at Blenheim, had a Cayenne and Queen Pine-apple; very fine Early Purple and Bellegarde Peaches; Elruge and Downton Nectarines; and West's St. Peters and Muscat Grapes, the latter large and good; but, as it has been stated, objectionable in point of colour. From Mr. Snow gr. to Earl de Grey, came excellent specimens of Lee's Perpetual Figs; admirable Violet Hative Peaches, both as regards size and colour; and most beautiful Elton and Black Tartarian Cherries. Mr. Chapman, gr. to J. B. Glegg, Esq., contributed a smooth-leaved Cayenne Pine-apple, weighing 5 lbs. 6 oz.; well-grown Noblesse and Violet Hative Peaches, and Elruge and Brugnon Nectarines; and Chasselas Musqué and Black Hamburgh Grapes, the latter perhaps scarcely so well coloured as they should have been.

Pine-apples.—Mr. Barron, gr. to J. H. Vivian, Esq., furnished two capital Queens, one weighing 6 lbs., the other 5 lbs. 8 oz.; these were both finely shaped and well ripened. Mr. James, gr. to C. H. Leigh, Esq., Pontypool Park, had seven Queens, weighing respectively 5 lbs. 13 oz., 5 lbs. 3 oz., 5 lbs., 4 lbs. 15 oz, 4 lbs. 13½ oz., 4 lbs. 11½ oz., and 4 lbs. 11 oz.; and a Providence, not very well shaped, 7 lbs. 5 oz. From Mr. Jones, gr. to Lady Charlotte Guest, came six Queens, which weighed respectively 5 lbs. 1 oz., 4 lbs. 15 oz., 4 lbs. 7 oz., 4 lbs. 6 oz., 4 lbs. 5½ oz., and 3 lbs. 6 oz.; and an Enville, 8 lbs. 15 oz. Mr. Burn, gr. to the Hon. Col. Pennant, sent three good Queens, weighing respectively 4 lbs. 14½ oz., 4 lbs. 3 oz., and 3 lbs. 14½ oz.; and a Black Prince, 6 lbs. 3½ oz. Mr. Davies had four well-ripened Queens, the heaviest of which was 4 lbs. 1½ oz.; and Mr. Fleming, gr. to the Duke of Sutherland, at Trentham, had a fine fruit of the same description of Pine, weighing 4 lbs. 5 oz. From Mr. Hayes, gr. to the Bishop of London, came five Providence Pines, weighing respectively 7 lbs. 9 oz., 7 lbs., 6 lbs. 11 oz., and two each 6 lbs. 3 oz. Mr. Jackson, gr. to G. Beaufoy, Esq., produced a Providence which weighed 10 lbs. 2 oz., but it was not very nicely shaped, and it was quite green towards the top. Other Pine-apples were exhibited, but all inferior to those just mentioned.

Grapes.—Excellent Black Hamburghs, large both in bunch and berry, and extremely well coloured, came from Mr. Frost, gr. to E. L. Betts, Esq., Mr. Fleming, gr. to the Duke of Sutherland at Cliveden, Mr. Hill, gr. to R. Sneyd, Esq., Mr. Haywood, gr. to Sir G. Goodman, Bart., Mr. Fleming, gr. to the Duke of Sutherland, at Trentham, Mr. Smith, gr. to A. Anderson, Esq., and Mr. Shrimpton, gr. to A. S. Doxat, Esq. Mr. Bailey, Shardeloes, also had some well coloured Black Hamburghs, as had also Mr. Frost, of Dropmore, Mr. Mitchell, Mr. Harrison, and Mr. Wood, gr. to C. R. Scott Murray, Esq.; the bunches in the last-named exhibition consisted of what is called Wilmot's Black Hamburgh. Of Muscats, one of the largest bunches possibly ever seen of the Cannon Hall kind was shown by Mr. Strachan, gr. to K. B. Hill, Esq., of Bache Hall, Cheshire. It measured upwards of a foot in length, nearly as much across the shoulders, and the berries were large and regularly diffused over the bunch; it was reported to weigh above 4½ lbs. For this a first prize was very justly awarded. Excellent Muscats also came from Mr. Allport, Doddington Park, Mr. Bore, Mr. Frost, Mr. Fleming, Trentham, Mr. Dods, Mr. Tegg, Mr. Hill, Mr. Tillyard, Mr. Taylor, Mr. Mitchell, Mr. Bucktrout, and Mr. Young, gr. to Viscount Barrington. Other kinds of Grapes consisted of Frontignan from Mr. Allport, Muscadines from Mr. Houliston, Mr. Tillyard, Mr. Mitchell, Mr. Wood, and Mr. Bailey; Sweetwater from Mr. Williams, and Black Prince from Mr. Hill and Mr. Houliston; the former fine bunches, and covered with a beautiful bloom. Three bunches of what was called a new Grape were exhibited. They were long and tapering, and the berries resembled those of the White Nice or Syrian.

Grapes in pots came from Mr. Ivison, gr. to the Duke of Northumberland, at Syon. The sorts were Black Hamburgh and Muscadine, both well furnished with good fruit.

PEACHES AND NECTARINES.—Elruge Nectarines, large and well coloured, came from Mr. Dods, gr. to Sir J. Cathcart, Bart., and the same exhibitor had also some fair Royal George Peaches. Mr. Brown, gr. to W. C. Cartwright, Esq., communicated Jeton de Venus and Royal George Peaches, large and good, together with some fair Violet Hative Nectarines. Very fine Royal George Peaches came from Mr. Wright, gr. to J. Elgers, Esq., of Putney Park; and Mr. Tillyard had beautiful Violet Hative Nectarines. Large and well-ripened Royal George and Bellegarde Peaches, and Murray Nectarines, were furnished by Mr. Munro, gr. to the Earl of Clarendon, at the Grove, Watford. Mr. Busby, gr. to J. Crawley, Esq., had Violet Hative Peaches, and Pitmaston Orange and Elruge Nectarines. Williams' Peach came from Mr. Turner, gr. to Miss Hooper; Noblesse and Royal George Peaches, and Elruge Nectarines, were shown by Mr. Fleming, who also sent two small fruit of the Stanwick Nectarine. Murray Nectarines were contributed by Mr. Munro, gr. to Mrs. Oddie. Mr. Bore sent Elruge Nectarines.

APRICOTS.—The only dish, in addition to Mr. Ingram's, was one of the Moorpark variety, from Mr. Fleming, gr. to the Duke of Sutherland, at Trentham.

FIGS.—In addition to the fine fruit in Mr. Snow's collection, were Lee's Perpetual from Mr. Fleming, of Trentham, and Brown Turkey from Mr. Fleming, of Cliveden.

CHERRIES.—Good specimens of May Duke came from Mr. Houliston, gr. to J. Berners, Esq., and of Circassian from Mr. Taylor, gr. to J. Coster, Esq., and Mr. Marchan, gr. to J. Smith, Esq. Mr. Bailey, gr. to T. Drake, Esq., contributed examples of Bigarreau. Messrs. Lane furnished some well-fruited dwarf Morello trees in pots.

STRAWBERRIES.—Mr. Lydiard, of Bath, communicated very fine dishes of Goliath, Eleanor, Myatt's Surprise, and Trollope's Victoria. Mr. Houliston sent Keens' Seedling, Mr. Bailey a dish of Shardeloes Pine, Mr. Goodhall, gr. to Lady Webster, British Queen, and Mr. Marchan and Mr. Gainsford each contributed dishes of the same variety. Of seedlings there were several. Mr. Myatt showed a large, fine-looking sort, the flavour of which, like that of most very large-fruited varieties, was inferior. Mr. Walker, of Devizes, had a seedling of little merit. Mr. Kitley, of Bath, sent Carolina superba, which received a first-class Certificate. Its flavour resembles that of the old Pine, or Carolina, and its appearance is much handsomer. Mr. Ingram had two kinds, one named Prince Alfred, the other Filbert; both good-looking fruit. Mr. Ward, gr. to W. Stephens, Esq., again showed a dish of Omer Pacha. Mr. Underhill, of Edgbaston, Birmingham, received a first-class Certificate for a kind named Sir Harry, a large very dark fruit, of good flavour. Mr. Bates, of Moulsey, had a dish of British Queen, of enormous size, but it unfortunately arrived too late to be noticed by the judges. Mr. Wrench showed fruit of Myatt's Pine-apple Strawberry, a sort much sought after some years ago, but now rarely to be met with.

RASPBERRIES.—Mr. Laing, of Twickenham, showed some tops of branches, well furnished with fruit, of what he calls his Prolific Raspberry.

MELONS.—The best was Victory of Bath, from Mr. Munro, gr. to Mrs. Oddie, and the next best an Egyptian green-fleshed from Mr. Frost, of Dropmore. Other sorts consisted of Cashmere, Hybrid ditto, Hoosainee, Trentham Hybrid, and other kinds from Mr. Fleming; Camerton Court, from Mr. Taylor; Bailey's Green-fleshed; and Masulapatum, from Mr. Coe.

Mr. Butcher, of Stratford-on-Avon, had a dish of Hunt's Duke of Gloucester Apple, which was almost as plump and sound as when first gathered from the tree. Oranges, Citrons, and Lemons came from Mr. Williams, gr. to C. B. Warner, Esq., and Mr. Ivison contributed fruit of Nutmeg, Vanilla, Papaw, and Plantain.

In collections of 20 STOVE and GREENHOUSE PLANTS, the first prize was awarded to Mr. Speed, of Edmonton, for the following, viz.:—

- Allamanda cathartica
- „ grandiflora
- Aphelexis macrantha purpurea
- Æschynanthus pulcher
- Clerodendron Kæmpferi
- „ fallax
- Cyrtoceras reflexum
- Dipladenia crassinoda
- „ splendens
- Erica obbata
- Erica tricolor major
- Epacris miniata
- Franciscea acuminata
- Ixora coccinea
- „ javanica
- Pimelea decussata
- Phænocoma prolifèrum
- Statice Holfordi
- Stephanotis floribunda
- Vinca oculata

This collection was certainly one of the best of the kind that could possibly be produced at this season of the year, and therefore well deserved the distinction it received. The whole of the plants which it contained were finely grown, clean, and beautifully flowered. In these respects the most remarkable were perhaps the Allamandas, Stephanotis, and Dipladenias, all of which were well furnished with flowers. The Phænocoma was literally covered all over with lively brilliant pink blossoms, a very uncommon thing with this plant. The Holford Statice was a magnificent specimen of this macrophylla-like kind. Cyrtoceras reflexum is an extremely useful plant, its Hoya-like flowers, and bright green foliage having a cheerful and interesting appearance. The Aphelexis was a beautiful specimen of this best of all Everlastings.

Messrs. Fraser, of Lea-bridge Road, Leyton, Essex, were placed second. Their plants consisted of:—

- Allamanda Schotti
- Aphelexis macrantha purpurea
- „ humilis
- Burtonia conferta
- Clerodendron Kæmpferi
- „ squamatum
- Dracophyllum gracile
- Dipladenia crassinoda
- Erica ventricosa Bothwelliana
- „ metulæflora bicolor
- Ixora coccinea
- Kalosanthes miniata
- Polygala cordata
- Pimelea diosmæfolia
- Phænocoma prolifèrum
- Relhania squarrosa
- Statice Holfordi
- Stephanotis floribunda
- Vinca alba
- „ ocellata

The two Clerodendrons in this group were fine specimens, one of them bearing three panicles of brilliant scarlet flowers. It also contained two beautiful plants of Stephanotis, and the Allamandas and Dipladenias were in good condition. The Holford Statice was a remarkably fine plant of the kind, and the scarlet Ixora and Erica metulæflora bicolor were all that could be desired in the way of good plant growing.

The third group of 20 plants was furnished by Messrs. Rollisson, of Tooting. It consisted of—

- Aphelexis humilis
- „ macrantha purpurea
- Allamanda Schotti
- Clerodendron affine
- „ paniculatum
- Cyrtoceras reflexum
- Dipladenia crassinoda
- „ splendens
- Erica Cavendishi
- „ ventricosa grandiflora
- Erica Irbyana
- Epacris miniata
- Ixora coccinea
- „ javanica
- Kalosanthes coccinea
- „ miniata
- Polygala cordata
- „ oppositifolia
- Rondeletia speciosa
- Sollya linearis

The most striking feature of this collection was its Kalosanths, which were large and well bloomed, more especially K. coccinea. The Dipladenia, Ixora, and Cavendish Heath were all good plants. Perhaps the least showy of the group was Clerodendron paniculatum, which was not in good condition.

A fourth collection of 20 plants was furnished by Mr. Rhodes, gr. to J. Philpott, Esq., of Stamford Hill. It contained—

- Aphelexis spectabilis
- „ macrantha rosea
- Clerodendron squamatum
- „ Kæmpferi
- Dracophyllum gracile
- Dipladenia crassinoda
- Erica Bergiana
- „ tricolor elegans
- Ixora crocata
- Kalosanthes coccinea
- Kalosanthes miniata
- Leschenaultia Baxteri
- Pimelea mirabilis
- Roella ciliata [noides
- Rhynchospermum jasmi-
- Sollya linearis
- „ heterophylla
- Stephanotis floribunda
- Tetratheca verticillata
- Vinca oculata

These were all well grown and in good condition, with the exception of Roella ciliata, the foliage of which was rusty and decayed looking, an appearance which this plant generally presents, and which greatly detracts from its beauty.

Of collections of 15 STOVE and GREENHOUSE PLANTS, there were several. The best came from Mr. Dods, gr. to Sir J. Cathcart, Bart., of Cooper's Hill, Englefield Green. It contained—

- Aphelexis humilis
- „ macrantha purpurea
- Azalea Danielsiana
- Clerodendron fallax
- „ Kæmpferi
- Erica Cavendishi
- Leschenaultia formosa
- „ biloba
- Pimelea linifolia
- „ mirabilis
- Phænocoma proliferum
- Polygala cordata
- Kalosanthes miniata
- Vinca alba
- „ rosea

This group contained Azalea Danielsiana still finely in flower; an admirable specimen of Aphelexis macrantha purpurea, the best of all the Everlastings; and a good blue Leschenaultia, though not very well in flower. The Sollya linearis was useful for its colour, good blues being scarce among stove and greenhouse plants.

A second group of 15 plants came from Mr. Barter, gr. to A. Basset, Esq., of Stamford Hill. It consisted of

- Allamanda Schotti
- Clerodendron squamatum
- Dipladenia crassinoda
- „ splendens
- Erica ventricosa Bothwelliana
- „ ventricosa grandiflora
- Ixora javanica
- „ coccinea
- Kalosanthes coccinea
- „ miniata
- Leschenaultia biloba
- Phænocoma prolifèrum
- Stephanotis floribunda
- Vinca alba
- „ rosea

The Scarlet Kalosanth in this group was extremely well flowered and highly effective, as was also the Clerodendron. The Schott Allamanda has the largest flowers of any of the genus, and when well bloomed, as this was, it makes an admirable display. Erica Bothwelliana is a good addition to the class to which it belongs, the blooms being large and handsome. One of the finest of all the ventricosas is, however, v. grandiflora. The Java Ixora was hardly sufficiently in flower. Dipladenia crassinoda was charmingly flowered.

Mr. Carson, gr. to W. F. G. Farmer, Esq., was third with the following—

- Aphelexis macrantha purpurea
- Allamanda cathartica
- „ grandiflora
- Æschynanthus Lobbianus
- Clerodendron splendens
- Dipladenia crassinoda
- „ splendens
- Exostema aquaticum
- Ixora Griffithi
- Jatropha pandurata
- Kalosanthes miniata
- Leschenaultia formosa
- Lemonia spectabilis
- Rondeletia speciosa
- Roupellia grata

The Lemouia in this instance was not "showy," though it has a good colour; it may be interesting enough when closely and leisurely examined, but it is not sufficiently effective to make a good exhibition plant. The Exostema was admired for the singular shape of its flowers, which served to make an agreeable variety. The Roupellia grata is seldom seen at exhibitions; though not very handsome it contrasts well with the plants more commonly to be met with at such displays. The Allamanda cathartica and Clerodendron splendens were both well flowered.

A group of 15 plants, from Mr. Hamp, consisted of—

- Allamanda cathartica
- Azalea variegata
- Æschynanthus pulcher
- Boronia serrulata
- Crowea saligna
- Dracophyllum gracile
- Dipladenia crassinoda
- „ splendens
- Erica ventricosa
- „ Cavendishi
- Hoya bella
- Ixora alba
- „ crocata
- Pimelea linifolia
- Xanthosia rotundifolia

Among these, Erica Cavendishi was a very fine plant but the beauty of its blossoms was unfortunately nearly over. The Dipladenia was a good specimen, as were also the charming Hoya Bella, and the Griffith Ixora.

Collections of six STOVE and GREENHOUSE PLANTS in "pots or tubs not less than 20 inches in diameter" were furnished by Mr. Peed, gr. to Mrs. Tredwell, of Norwood, and Mr. Over, gr. to W. M'Mullen, Esq., of Clapham. The former had fine specimens of Erica Irbyana, Clerodendron paniculatum, Allamanda Schotti, Kalosanthes miniata, Vinca alba, and Ixora coccinea.—Mr. Over produced Erica Aitoniana, Epacris miniata, Hoya carnosa, Allamanda cathartica, Ixora crocata, and Dipladenia crassinoda. Some of these were scarcely far enough advanced in bloom.—Groups of six plants in 13-inch pots came from Messrs. Taylor, Over, Reser, Peed, and Pamplin. Among them were good examples of Cyrtoceras reflexum, Rondeletia speciosa, Dipladenias, Clerodendrons, Epacrises, Cape Heaths, Kalosanths, Tetrathecas, Ixoras, Sollyas, Allamandas, Hoyas, Stephanotis, Leschenaultias, and Everlastings.

HELICHRYSUMS were exhibited by Messrs. Fraser. The varieties were Aphelexis purpurea macrantha, A. m. rosea, A. sesamoides, A. s. superba, A. spectabilis, and A. purpurea grandiflora.

KALOSANTHS.—The following were shown by Messrs. Fraser and Taylor; viz., coccinea, c. superba, miniata, nitida, versicolor, and a kind called Louis Napoleon Bonaparte.

ORCHIDS.—These, as might be expected, were scarcely so fine as they were in May and June. Mr. Williams, gr. to C. B. Warner, Esq., had the following:—

- Aerides affine
- „ odoratum
- „ maculosum
- „ Brooki
- Calanthe veratrifolia
- „ masuca
- „ furcata
- Cattleya Harrisoniæ
- „ Mossiæ superba
- Cypripedium barbatum
- Cypripedium Lowi
- Epidendrum verrucosum
- Oncidium Lanceanum
- „ Papilio
- Phalænopsis amabilis
- „ grandiflora
- Phaius albus
- Saccolabium guttatum
- Sobralia macrantha
- Vanda suavis

The Calanthe masuca was still in bloom and tolerably fresh, though it has been shown in this collection on several previous occasions. The Harrison Cattleya, a beautiful species, was in this instance scarcely so well flowered as could have been wished. Cypripedium Lowi was still in perfection, as was also the Spotted Saccolabe, though both have been in blossom for many weeks. The different species of Aerides were all good, more especially A. maculosum, which is rather a scarce kind.

Mr. Woolley, gr. to H. B. Ker, Esq., produced—

- Aerides affine
- „ odoratum
- Cattleya Mossiæ
- Cypripedium barbatum
- Dendrobium formosum
- „ transparens
- Dendrochilum filiforme
- Epidendrum alatum
- „ cochleatum
- „ cinnabarinum
- Epidendrum crassifolium
- Oncidium luridum guttatum
- „ leucochilum
- Odontoglossum Lawrencea-
- Peristeria elata [num
- Phaius albus
- Saccolabium guttatum
- Sobralia macrantha
- Stanhopea tigrina
- Vanda Roxburghi

The most striking plant in this group was certainly the spotted variety of Oncidium luridum, which was covered all over with flowers of the richest cinnamon-brown colour. Phaius albus was extremely well bloomed, the white colour being clear and beautifully brought out. The Odontoglossum Lawrenceanum is well known to be a mere variety of O. Insleayi. The slender-growing transparent Dendrobe is a pretty small-flowered species in the way of nobile, and very suitable for persons of limited accommodation. The Epidendrum crassifolium and Peristeria elata were both good plants, and well flowered.

Collections of 15 ORCHIDS were shown by Messrs. Veitch and Rollisson. The former had—

- Aerides quinquevulnerum
- Cycnoches, sp.
- Cypripedium barbatum
- Dendrobium formosum
- „ Gibsoni
- Epidendrum vitellinum
- Oncidium ampliatum majus
- „ flexuosum
- Oncidium pulvinatum
- Phalænopsis amabilis
- „ grandiflora
- Saccolabium Blumei
- „ Rheedi
- Vanda Batemanni
- „ tricolor.

The Aerides quinquevulnerum was a fine plant, of this somewhat rare species, but its blossoms, unfortunately, were hardly sufficiently expanded to show themselves to advantage. The Gibson Dendrobe is a charming species, with which all seemed delighted, and the Bearded Lady's Slipper (Cypripedium barbatum), was one of the finest plants of the kind that has been shown for some time. The large variety of Oncidium ampliatum was also an object of interest, its clear yellow blossoms being just in perfection. The Epidendrum vitellinum majus was likewise much admired for its fine colour.

Messrs. Rollisson produced—

- Aerides affine
- „ odoratum
- „ quinquevulnerum
- Cattleya citrina
- „ crispa
- „ „ superba
- „ Mossiæ
- Dendrobium Gibsoni
- Dendrochilum filiforme
- Grammatophyllum multi-
- Miltonia spectabilis [florum
- Uropedium Lindeni
- Saccolabium Blumei
- Stanhopea aurea
- „ tigrina

The more remarkable plants in this group were perhaps the Uropedium, which puts one in mind of the Tailed Lady's Slipper, but it is not so handsome; and Cattleya crispa superba, a variety of far greater beauty than the species, the blossoms being larger and much better coloured. The many flowered Grammatophyl is also a plant not very often met with, and, though more singular than beautiful, it served to create an agreeable variety. The Dendrochilum filiforme, with long green tails, was also an object of interest.

Groups of 10 ORCHIDS were furnished by Messrs. Carson, Ivison, and Gedney. Mr. Carson sent—

Acineta sp.	Dendrobium aduncum
Aerides quinquevulnerum	Dendrochilum filiforme
Aspasia lunata	Lycaste Skinneri
Cattleya superba	Phaius albus
Cypripedium barbatum	Saccolabium Blumei

The White Phaius was not so effective as it should have been, being unfortunately insufficiently advanced in bloom. The Saccolabe was a very fine plant, one of its four fine racemes of flowers measuring more than a foot in length, and the blossoms were all in the greatest perfection. The Cypripedium barbatum was a very dark variety of this useful plant. The Dendrobium was the best plant of the kind at the whole exhibition, its singular looking green tails being both numerous and fine.

Mr. Ivison contributed—

Aerides odoratum	Odontoglossum hastatum
Cattleya sp.	Oncidium Papilio
Dendrobium densiflorum	" ampliatum majus
Epidendrum cinnabarinum	Saccolabium guttatum
" macrochilum	Vanda tricolor

The Aerides odoratum was a spreading plant, beautifully furnished with flowers; and Vanda tricolor had two fine bunches of blossoms on it. Of all the many varieties of Cattleya Mossiæ, that exhibited here as Cattleya sp. is perhaps the very handsomest, its sepals and petals being pure white, while the lip is stained with deep purple. The effect of such a contrast is, as may be imagined, striking and beautiful.

Mr. Gedney produced—

Angræcum caudatum	Oncidium flexuosum
Calanthe masuca	" Lanceanum
Dendrobium nobile	Phaius albus
Epidendrum vitellinum	Phalænopsis grandiflora
Lælia anceps	Sobralia macrantha

Among these Phalænopsis was a good specimen of that ever-blooming plant, and the White Phaius, as well as the Lance Oncid, the charming Lælia anceps, and Epidendrum vitellinum, were all excellent examples of good gardening.

Cape Heaths were well flowered, and in beautiful condition, considering the season. Collections of 10 plants were shown by Messrs. Rollisson, Fraser, and Peed; and of 6 plants by Messrs. Roser, Taylor, and Over. In these exhibitions were good specimens of Cavendishi, Parmentieri rosea, Massoni, jasminiflora alba, different varieties of tricolor and ventricosa, Irbyana, Aitoniana, retorta, ampullacea, eximia, rubens, mutabilis, ferruginea, and other well-known sorts.

Roses (cut) were shown in abundance, and, maintaining as they did their freshness throughout the day, they formed, as they always do in July, a highly attractive feature of the show. Collections of 50 sorts were contributed by Messrs. Lane, Paul, Francis, and Wilkinson; and of 25 varieties by Messrs. Munro, May, Sage, Coe, and Rowland. In the different boxes we remarked charming blooms of nearly all the leading kinds in cultivation; but more especially of Paul Ricaut, which is certainly one of the very best of Roses, being of a glowing crimson colour and extremely good shape. We also remarked Géant des Batailles in good condition, and most beautiful blooms of Coupé de Hébe, which everybody knows is a first-class Rose; as are also Mrs. Bosanquet, Paul Perras, Duchess of Sutherland, Charles Duval, Chénédolé, and William Griffiths, good blooms of all of which were shown. Vicomtesse Decazes and Safranot were produced in very good condition, as were also Boule de Nanteuil, Brennus, Mrs. Elliot, Baronne Prevost, William Jesse, Devoniensis, and Queen Victoria. Messrs. Wood and Son had a seedling of good colour and shape; but, perhaps, scarcely full enough. As a pillar Rose it will be an acquisition.

Of Single Specimens the best were Pleroma elegans, of a fine bush, well furnished with blossoms, and Erica obbata, from Messrs. Veitch; a well grown plant of Masson's Heath, from Mr. Speed; and an example of the White Butterfly Plant (Phalænopsis grandiflora), from Mr. Gedney. Messrs. Veitch also had an example of the charming Veronica variegata.

New Plants.—The more important of these are adverted to in a leading article in another column; but in addition to what are there noticed it may be remarked that Messrs. Veitch sent finely bloomed masses of Impatiens Jerdoniæ, Philesia buxifolia, a Ceropegia from Java, blooms of a Dipladenia resembling crassinoda from South America; Eugenia Ugni, and Myrtus apiculata from Patagonia; and bark, cones, and plants of Wellingtonia gigantea. Messrs. Henderson, of Pine Apple Place, had Begonia xanthina, a yellow flowered kind, with handsome foliage; and a small yellow Stylidium, called mucronifolium. Messrs. Rollisson produced Abelia uniflora, a species of little beauty; Mr. Carson, Ornitharium striatulum; Mr. Ingram, a Sabbatia, from Texas, an annual, with sweet-scented pink flowers; and two very pretty hybrid deep rose coloured Begonias—one fragrant and called suaveolens rosea, the other hybrida—both highly desirable kinds; Messrs. Standish and Noble produced their two new Clematises—lanuginosa and its pale variety—both of which have been noticed in previous reports; Messrs. Osborn had Lysimachia Leschenaulti, a useful looking herbaceous plant, with heads of rosy flowers, resembling those of a Verbena; Messrs. Henderson, of St. John's Wood, contributed some pretty Gloxinias and Achimenes; and Mr. Salter, of Hammersmith, had a variegated Fuchsia, a new hybrid Veronica, and one or two other plants.

Collections of Variegated Plants were contributed by Messrs. Veitch, Rollisson, Messrs. Henderson, of Pine-apple Place, and Mr. E. G. Henderson, of St. John's Wood, all of whose groups, owing to the variety and different habits of the plants of which they were composed, we need not say were extremely interesting. Among them we remarked the various kinds of variegated Orchids, fine specimens of the handsome Cissus discolor; Coleus Blumei, with black-blotched pale green leaves; Maranta rubro-venia, with red-veined dark green foliage; M. variegata, with leaves splashed with white; Bilbergia rosea, beautifully mottled with white; Caladium picturatum, a narrow leaved kind with a wide stripe of red running through the centre; C. pæcile, dark-green and red, and spotted with white; variegated Pines; a flowering plant of what is called Nidularia fulgens, with dark green slightly spotted foliage; a Yucca with leaves edged with yellow; Canna discolor, with red-veined foliage; Begonia marmorea, with leaves splashed with white; B. Thwaitesi, a Java species, the leaves of which when young are of a beautiful crimson colour; together with Dracænas, Crotons, a variegated variety of Hydrangea japonica, Pavetta borbonica, Elæodendron venosum, a slender-growing variegated Vine, and other plants.

Of plants remarkable for Fine Foliage collections were furnished by Messrs. Veitch, Rollisson, and Mr. E. G. Henderson. Among these were Bischoffia javanica, Schizolobium glutinosum, a plant with fine Acacia-like leaves; Uhdea pinnatifolia, a Jonesia with very large fine foliage, Dracæna umbraculifera, Nephrolepis davallioides, with beautiful long graceful leaves; Rhopala magnifica and corcovadensis, Tillandsia carnea, Xanthochymus oblongus, and various others.

Hothouse Ferns and Lycopods were admirably shown by Messrs. Veitch, and Messrs. Woolley and Gedney sent Ferns. The names of these have often been given in former reports, and therefore we need not repeat them here. We may, however, remark, that never before were there exhibitions of this kind produced in better order, or, as a whole, more generally interesting.

Collections of Pitcher Plants, exhibited by Messrs. Veitch and Rollisson, were especially striking and interesting, as were also two or three examples of Dionæa, or Venus' Fly-trap. Among Nepenthes, the more remarkable were lanata, Hookeriana, Rafflesiana, sanguinea, lævis, phyllamphora, ampullacea, and distillatoria. Mr. Gedney, gr. to Mrs. Ellis, of Hoddesdon, had a good plant of N. Rafflesiana, well furnished with pitchers, large and fine.

Rhododendrons.—Of Sikkim and Bootan kinds collections were furnished by Messrs. Veitch and Mr. E. G. Henderson. The more remarkable of the Bootan sorts were Nuttali, a robust-looking kind, with leaves 6 inches long; Keysi, a dwarf-growing sort found above the range of R. Hookeri and Falconeri, leaves between 2 and 3 inches long; Windsori, said to be deeper coloured than R. arboreum; Kendricki, a kind discovered at an elevation 7000 feet above the sea, growing in company with the R. Edgworthi; flowers said to be large and deep red. Calophyllum, Jenkinsi, eximium, longifolium, and Camelliæflorum, were also among the number of these varieties, of which a dozen or more kinds were exhibited.

Pelargoniums, both fancy and ordinary kinds, were shown in extremely good condition by Messrs. Turner, Gaines, and Maher. The sorts were not different from those mentioned at p. 436 of last week's paper. Mr. Turner again showed his fine plant of Rowena, in an 8-inch pot, still in fine flower, and Mr. Gaines reproduced his "New Fancies," which proved so very interesting at former exhibitions.

Notices of Books.

Flora Bristoliensis. By E. H. Swete. (8vo, Hamilton.) This is a very useful guide to the rich Flora surrounding Bristol. In addition to the usual lists of plants, it contains good geological descriptions, showing in what way the author finds the limits of species affected by the soil on which they grow; to which is added a well-executed map of the country five miles round Bristol. We venture to suggest that in future editions such bad orthography as systala for systyla, Lepedium for Lepidium, Orobancha for Orobanche, and so on, would be better if corrected.

Pescatorea.—The first number of this work, announced at p. 236, is before us. It contains well drawn and coloured folio plates of *Odontoglossum Pescatorei, Uropedium Lindeni, Howlletia odoratissima*, and *Dendrobium Farmeri*, of which the third, a very handsome and fragrant plant, had not been previously figured. To each plant Mr. Luddemann has added a detailed statement of the cultivation which he finds most successful.

The Micrographic Dictionary, Part III. (Van Voorst), reaches Arthrocladia, and contains some very excellent plates, and unusually good woodcuts.

Wanderings among Wild Flowers, by Dr. Spencer Thompson (12mo, Groombridge), is, we presume, intended as an introduction to botany for children. For this it would be well adapted, as far as we have been able to examine it, were it not for the woodcuts, which are unworthy any kind of letter-press, and some of which are calculated to do more harm than good. We venture to ask the author where his artist found the thing called "Leafbud of Horse Chesnut," at p. 16. It appears to have been intended as a rude representation of the end of the rail of some iron balustrade.

Pictures from the East (Chapman and Co., "Reading for Travellers,") consist of sketches of customs, &c., in Ceylon, reprinted from "Chambers' Journal" and the "Household Words."

New Plants.

69. Juniperus drupacea, *Labillardière Plant Syr. dec.* 2, 14, *t.* 3.

This is one of the plants referred to at p. 387. The figure is copied from the *Revue Horticole*. In addition to what has already been said about it, we gather from Labillardière that it is an upright branching shrub, with a pale brown (testaceous) fruit, growing in Syria on the mountain called Djebel-Laçara. Clusius says it is known all over the east under the name of Habbel or

Abbel, and that its fruit is brown passing into black, as large as the cone of a Cypress, to which plant it bears much resemblance. Bellonius relates how he found on Mount Taurus, just below the snow, Juniper bushes (evidently this) of larger stature than usual, growing even to the size of Cypresses, with a *sweet fruit*, which the inhabitants ate; the nut in the inside was as long and big as an Olive, and so hard that it could only be broken with a hammer. He places it next after the Cedar among beautiful evergreen trees.

70. Abies Kæmpferi, *Supra*, p. 255.

The following is a good representation of the cone of this curious tree, of which we regret to learn that Mr.

Glendinning has succeeded in raising only about a dozen plants.

FLORICULTURE.

The Chrysanthemum.—I have proved the following to be a most successful method of producing really magnificent specimens of this favourite autumn flower. I insert my cuttings under hand-glasses on a cutting bed in time for them to be sufficiently rooted to enable them to endure the operation of transplanting by the first week in July. I plant them out in beds previously manured with plenty of well-rotted dung, setting them in rows 1 foot apart, and as much between the plants. After they have grown sufficiently large to require staking, and which they will have done in about a month after planting, they are neatly tied to rods, which I contrive to be as near as possible the height to which the plants are likely to grow; at the same time I apply a layer of dung the depth of 3 inches or thereabouts to the surface of each bed. This, while it protects the roots from the effects of continued dry weather,

furnishes the plants during every shower of rain with a copious supply of liquid-manure, which wonderfully accelerates the growth, and imparts to the foliage that dark green massive appearance which is so indicative of vigorous health. Beyond tying the plants occasionally as they require it, they may be left to themselves, until the first week in the following October, when they should be taken up and potted firmly in pots of sufficient size to suit the ball. As a rule, I never attempt to remove the plants until the buds are fairly set; it is, therefore, advisable to defer potting the late flowering varieties until the end of October. After potting, the mould in each pot should be saturated with water, and care should be taken on all subsequent occasions to give the plants plenty of water, and if this is well attended to the plants will not flag or drop their foliage. Treated in this way the time the plants are confined to pots is limited to the shortest possible period, and they never present that starved leggy appearance which they frequently exhibit when they are grown long in pots. When the amount of labour expended in watering is taken into account, together with the frequent drawback of the plants producing diminutive and partially developed flowers, the advantages of the above plan will be apparent, especially when it is recollected that, with scarcely a tithe of the trouble, the cultivator will be in a condition to command a first-rate supply of well grown and finely furnished plants, in every respect worthy of the name, richly studded with flower buds. The true colour, size, and shape of the flowers may also, with comparative certainty, be depended upon. The practice of growing the Chrysanthemum in pots appears to have been founded on the generally received opinion, that, in order to obtain a good show of flowers on young plants, it is necessary to confine the roots in pots proportioned to the size of the plants. Cultivators disposed to give the two methods a fair trial will, however, I am persuaded, acknowledge that the Chrysanthemum does not make such a bad use of its liberty as to render it imperative to put on the roots artificial restriction; on the contrary, strong healthy plants, be they ever so young, will flower freely and immeasurably finer when grown in beds, and are in every respect very far superior to the best Chrysanthemums that can be produced in pots. *R. M.*

National Floricultural Society, *June* 29.—Mr. Turner in the chair. Of subjects exhibited there were Antirrhinums from Mr. Smith; Calceolarias from Mr. Cole, St. Alban's; Pinks from Mr. Turner; Pansies from Messrs. Downie and Laird; and a collection of Sweet Williams (cut blooms) from Mr. Bragg. Certificates of Merit were awarded to Pinks "Brunette" and "New Criterion" (Maclean), both of which were exhibited by Mr. Turner; the former is a flower strikingly broad in the petal, and has a uniform lacing of purplish crimson, pod first-rate—and, had the edge been quite even, it would have had the highest award. "New Criterion" is a nice flower, with even petals, and a moderate and even lacing of purple, pod good. A Certificate of Merit was awarded to Messrs. Downie and Laird for Pansy "Beauty," a medium-sized sort, with moderately good form and fair substance—ground creamy white, with heavy belting of purple. Mr. Cole's Bedding Calceolaria, "Eclipse," maintained its character, proving a fine trusser, and for colour it is matchless. Mr. Bragg's Sweet Williams, of which there were some 70 varieties, were interesting enough, their distinguishing peculiarity being their evenness of petal; the colours and markings of many of them were curious and beautiful.

Miscellaneous.

Novel Fête at Malta.—His Excellency Sir W. Reid endeavoured to turn the recent festival of St. Peter and St. Paul to a practical use. It is the custom on this festival for all classes of people to make picnics to the country, about Boschetto and Civita Vecchia, where they have no object beyond eating and drinking, and some very poor races in the evening; in fact, it is too hot to make any exertion. However, Sir W. Reid got up a committee, and offered prizes for the best samples of cattle, corn, vegetables, machinery, silkworms, &c.; the prizes for Malta on a liberal scale, from 3*l.* down to 3*s.* There were some very fine mules, poultry, corn, Potatoes, and silkworms exhibited — also some great improvements in machinery; but the pleasantest sight of all was the happy-looking people, picnicing under the trees. All appeared thoroughly happy and contented. Here was every class, from the commanders-in-chief, judges, senators, &c., down to the poorest peasant, and all appeared to be thoroughly enjoying themselves. It must have been a proud day for Sir William; and I believe all classes felt grateful to him for his endeavours to turn this festival into so useful an exhibition. Doubtless, from the many prizes given, next year's exhibition will bring forth more competitors. *Daily Paper.*

Wood Paper.—A very excellent method of manufacturing paper and pasteboard pulp from wood, originally invented by M. Hartmann, has been improved upon by Mr. Schlesinger, of Bradford, who, after taking much trouble to introduce the plan into this country, is now, as the working partner of the inventor, conducting the process with great success. As the manufacture of paper is a subject at present forcing itself upon public attention, we think it right to give prominence to every good improvement relating to it. Process:—Cut a tree —say 6 feet long and 2 feet diameter — into nine lengths of 8 inches by 2 feet diameter each; place these blocks into the boxes, with the fibres running in the same direction as the stone turns, lever them, then start the stone at the rate of about 200 revolutions per minute. By the foregoing process a fibrous pulp is obtained equal to that of ordinary rag-pulp, and lower in price. Moreover, this wood-pulp has the advantage of absorbing a greater quantity of mineral than ordinary rag-pulp, without deteriorating the strength of the pasteboard or paper. Light or hard woods will take the dye of even the most delicate colours as readily as rag-pulp. According to Mr. Schlesinger's calculation, he produces a pound of dry wood-pulp at about one penny, and makes no doubt that, in districts where wood and power can be had cheaper than at Bradford, it may be made at five-eighths to three-fourths of a penny per pound of dry pulp. The cheapest classes of wood, as Fir, Pine, Poplar, Willow, &c., suit his purpose best. We have had highly satisfactory specimens of the papers and pasteboards above enumerated submitted to our inspection. *Mechanics' Magazine.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—Some of the stove plants that have recently been brought into this house will require attention, to prevent their being injured by damp during cloudy weather, and it will probably be necessary to use slight fires occasionally for the purpose of drying the atmosphere of the house. The propriety of this will, however, largely depend upon circumstances; for in small well ventilated houses damp will hardly be troublesome, whereas in lofty houses, with but little ventilation, and the roofs overgrown with twiners, it may be very troublesome. But at this season there is nothing to fear from cold, and air should be freely admitted on every favourable opportunity, using every care to keep the atmosphere of the house as dry as possible, and keeping the plants clear of decaying flowers, &c. Considerable care will also be necessary in watering recently repotted specimens, whether of the soft or hard-wooded class, as, in the present state of the weather, they will require very little, and will be speedily injured by a careless supply. Continue to carefully regulate the growth of the twiners, but avoid tying them too close, and allow them to grow according to their natural habits as much as circumstances will admit. Examine the border plants frequently for insects, which, if allowed their own way at this season, soon injure the young tender growth. The Lucalias are matchless subjects for the conservatory borders, and are deserving of every care; but they are very subject to black thrips, and if this pest is in the house it will soon disfigure their noble foliage, unless kept under by some means. Tobacco smoke is the most effectual remedy for this pest, and repeated washings with the engine the next best; but there must be no trifling with this enemy, otherwise the beauty of the plants will be sacrificed for the season.

FORCING DEPARTMENT.

Pinery.—The long-continued cold, cloudy weather is most unfavourable for securing well-ripened, high-flavoured fruit; and, unfortunately, last week's directions are still applicable here. Indeed, if the weather continues such as it has been for some time past, ripening fruit must be assisted with a fair amount of fire-heat, keeping the plants dry at the root, and avoiding moisture in the atmosphere as far as circumstances will admit. Young growing stock will enjoy the present sunless weather, and, if properly attended to, will grow very rapidly; but care must be observed not to keep them too close, and so induce weakly growth: and, on the occurrence of bright sunshine, it will be necessary to shade slightly, to prevent the foliage being scorched. Use the watering-pot and syringe very cautiously, until we have more warmth and sunshine. Vineries. —Attend to last week's directions as to thinning late fruit; for depend upon it that a very moderate crop of first-rate quality will be in every respect more satisfactory than ever so heavy a crop if deficient in quality; therefore thin severely. Use brisk fires during the day where the fruit is colouring, and also see that ripe fruit is not injured by damp. Peaches.—The Peach enjoys a comparatively cool temperature while ripening, but this must not be combined with a close damp state of the atmosphere; therefore keep the atmosphere dry and in motion by using very slight fires on dull days in houses where the fruit is ripening. Examine the fruit daily, and gather before it is over ripe and loses its flavour. Trees from which the fruit has been gathered should be well washed with the engine if at all infested with red spider, the house kept cool, and every means used to preserve the foliage in a healthy state as long as possible. Melons.—Do not allow the bottom-heat to decline in dung beds, but apply lining where necessary to maintain a brisk growing heat; especially guard against any decline of the temperature where the fruit is setting. Keep the surface of the soil as dry as possible during damp cloudy weather, and remove decaying leaves immediately they are perceived; also apply quicklime wherever there is the slightest indication of canker.

FLOWER GARDEN AND SHRUBBERIES.

The Roses are the great attraction here at present, and these should be frequently looked over, removing decaying flowers, &c., which, if allowed to hang on the plants, have a very unsightly appearance. Now is the best season for observing the effect of the arrangement of the colours, &c.; and if any alteration is deemed necessary it should be carefully noted, which will greatly facilitate its execution at the proper season. Proceed with the propagation of favourite sorts which it may be desired to increase, either by budding or cuttings. We prefer having the Hybrid Perpetuals, Teas, Chinas, and Bourbons on their own roots, and firm short-jointed shoots of these root very freely at this season. But to ensure success they should be afforded a slight bottom-heat, carefully shaded, and not kept too warm until they emit roots. They will, however, root under a hand-glass on a shady border. Remove suckers from worked plants Cut back the shoots of the autumn flowering varieties to the most promising eye, as soon as all the flowers are expanded and begin to fade. If manure water cannot be conveniently given, stir the surface soil with a fork, and apply a good sprinkling of guano, the strength of which will be washed down to the roots, and will serve the same purpose as manure water. Slugs must be sharply looked after, otherwise plants to which they are partial will be very likely to be injured, for the weather has been very favourable for these nuisances. The propagation of "bedding out" stock for next season will soon require attention, therefore make the most of the present leisure, &c., for getting up a good stock of the more valuable herbaceous plants.

HARDY FRUIT AND KITCHEN GARDEN.

Those who depend upon young plantations of Strawberries for fruit, should get them planted while the ground is moist, and the weather favourable. If planted at once and properly cared for until the plants get established, a fine crop of superior fruit may be expected next season. We know a gardener, Mr. Markham, of Hewell, who never allows his Strawberry plantations to stand but one year, and he manages to secure immense quantities of prime fruit from a moderate breadth of ground. Where the plants are to stand only one year they should, however, be planted much thicker than is usually done, say four lines in a 5 feet bed, and 9 inches between the plants in the lines, allowing a foot of an alley between the beds. See that plenty of plants for forcing next season is potted at once, if not already done. As ground becomes vacant by the removal of early crops get it manured, dug, and planted with winter Greens, &c., without loss of time. Also provide a good supply of Turnips. Make the most of every favourable opportunity for the destruction of weeds. Cut Box edgings, clean and roll walks in showery weather, and keep all clean and neat.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON, For the week ending July 13, 1854, as observed at the Horticultural Gardens.

July.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Min.	Mean	Of the Earth 1 foot deep.	2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 17th, 1834—therm. 94 deg.; and the lowest on the 18th, 1851—therm. 39 deg.

Notices to Correspondents.

Books: *S S.* Macculloch on wine making.

Conservatory: *A B.* As far as we understand your account the mode of heating ought to answer; but you are very far from being clear.

Diseases: *T P W.* Your Vine leaves are very slightly affected by the warty excrescences which have been so prevalent this year. There is evidence now to show that this disease arises from some defect in the condition of the roots; and we should, therefore, recommend you to examine them, if you think the evil sufficiently aggravated to make it worth while meddling with them. *M J E.*

Insects: *C H D.* Your fly is not the woolly Apple blight, it is the aphideous Pemphigus affinis of Kaltenbach.—*J S.* The brown objects found with the Orchids are the egg cases of one of the species of Cockroaches. The black flies are Evania lævigata, the larvæ of which live as parasites in the egg cases, one of which, indeed, contained a living larva of the parasite. If you find more of the cases we shall be obliged to you for them. *W.*

Names of Plants: *J R M.* Spiræa filipendula.—*S H.* They are small galls, probably caused by the puncture of some insect.—*Weeks & Co.* How does it differ from Gesnera Lindleyi?—*Cork.* Anthyllis vulneraria.—*T W.* 1, Platanthera bifolia; 2, Ervum tetraspermum; 3, Carex curta.—*Sancho.* Solidago virgaurea and Centaurea dealbata are among them; as to the others, they are not common things, and cannot be accurately determined unless much better specimens than those you have sent are furnished.

Perry: *Pyrus.* Perry is perry, and champagne champagne; you cannot turn one into the other. Very fine squash perry, perfectly made, in good seasons, is however hardly inferior to the sparkling wine called champagne.

Retinospora: *R F.* The species of this genus are from Japan, and are possibly hardy in a good climate: they are very like Cypresses. Dacrydium Franklini perished near London, as did Quercus glabra; but it is reported to be safe more to the southward.

Rifles: *S G N.* If you believe the common gunsmiths there is nothing comparable to the old troublesome grooved rifle. If you believe disinterested common sense you will learn that Lancaster's smooth bore, or Pritchett's regulation pattern, are incomparably better in every respect. Of course gentlemen who have paid 60 guineas for a rifle don't like to admit that a much better tool can be bought for 5*l.*

Steps: *Cork.* You may make them cheaply of hard-burnt bricks on edge, set in strong Roman or Portland cement. They will last as long as stone. Mix your Roses.

Vinegar: *H G M.* The plant bearing this name is the mycelium or spawn of a fungus called Penicillium glaucum.

TURNIP SOWING.

SUPERPHOSPHATE OF LIME, made from Bone, which is the best Manure for Root Crops (see the Royal Agricultural Society's Journal, Vol. vi., part 2). PERUVIAN GUANO, NITRATE OF SODA, BONE DUST, SULPHURIC ACID, and all other Manures of known value. The PEAT MOSS CHARCOAL COMPANY have appointed the undersigned Sole Agents for the Sale of this fixer and distributor of Ammoniacal matter. They are also Sole Agents (in London) of the Patent Sanitary Company for the sale of their "Nitrogenised Carbon."—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

SUPERPHOSPHATE OF LIME, Guano, Bone Dust, Sulphate of Ammonia, Gypsum, Agricultural Salt, Grass Manure, and other Fertilisers, of superior quality, on sale, at the Coprolite Mills, Durham Wharf, Deptford Creek, Greenwich.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBES & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London: and from all the other Agents of the Company.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

DRUMMOND'S REAPING SCYTHES.—Farmers and others intending to use this excellent Corn Scythe during the coming harvest, will please supply themselves without delay, and thereby prevent the disappointment that was experienced last year, through the inability of the Subscribers to overtake the execution of orders received late in the season.
Price of a single Scythe ... ... 11*s.* 6*d.*
Ditto of three, package included... ... ... 32 6
Ditto of six, ditto ditto 60 0
Carriage paid to London, Liverpool, Hull, Birmingham, &c.
W. DRUMMOND & SON, Seed and Implement Warehouse, Stirling, N.B.
☞ Orders from unknown correspondents must be accompanied with a remittance, otherwise they cannot be attended to.

SCYTHES.

BOYD'S PATENT SELF-ADJUSTING SCYTHE will last out three of the ordinary sort, and is always ready for use.
"We have seen this Scythe at work, and can strongly recommend it."—See *Mark Lane Express*, May 16, 1853.
To be had of every Ironmonger and Nurseryman in the kingdom; and wholesale and retail of WM. DRAY AND CO., Agricultural Implement Makers, Swan Lane, London.

SCHOOL FOR GENERAL AND SCIENTIFIC EDUCATION (especially with regard to AGRICULTURE), Wickham Market, Suffolk, conducted by Mr. G. DOWNES.
At this establishment a sound and liberal education may be acquired on moderate and inclusive terms.
Soils, Minerals, and Manures carefully Analysed.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.
Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
The next SESSION will begin early in AUGUST. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.
The GUIDE TO THE ROYAL AGRICULTURAL COLLEGE FARM may be obtained of HAMILTON, ADAMS, & Co., Paternoster Row, London; and EDWIN BAILY, Cirencester. Price 1*s.*

BARTON'S PATENT STABLE FITTINGS AND ENAMELLED MANGERS.—These Fittings have all the newest improvements, and are the only patented invention of this description.
JAMES BARTON, Iron Founder, Smith, &c., 370, Oxford Street, a few doors East of the Pantheon.

SOUTHDOWN RAMS.

MR. R. H. ELLMAN informs his Friends that his RAMS are now ready for Letting or Sale. The Rams may be seen and terms known at any time.—Landport, Lewes.

SOUTHDOWN RAMS.

MR. W. SAINSBURY informs the Breeders of Southdown Sheep that his RAMS will be ready for Letting any time after the 22d day of July.
Manor House, West Lavington, Devizes.

SOUTHDOWN SHEEP.

MR. LUGAR informs the Breeders of Sheep that his SOUTHDOWN RAMS are now ready for Letting.
Hengrave, Bury St. Edmunds.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND, LINCOLN.—STAND No. 24.

WILLIAM PIERCE, AGRICULTURAL IMPLEMENT DEPARTMENT, Crystal Palace, Sydenham—Offices, Cannon House, Queen Street, London—will exhibit Cogan's Glass Churns, Glass Pails, Glass Butter Slabs, and various new articles in Glass, manufactured by Messrs. Cogan & Co., Leicester Square, London; as also a variety of Glass Milk Pans, Cream Pots, Lord Camoy's Syphons, Lactometers, Glass Tiles and Slates, Thick Glass for Farm Buildings, Stables, Hothouses, and Garden purposes, &c., &c.

ROYAL AGRICULTURAL SHOW AT LINCOLN, STALL 128.

CHIVAS'S NEW ORANGE JELLY TURNIP, FOR JULY AND AUGUST SOWING, PRICE 2*s.* PER LB.

GEORGE CHIVAS, SEEDSMAN, Chester, the introducer of the above unrivalled Turnip, respectfully acquaints the Nobility, Landed Proprietors, and Agriculturists generally, that he purposes attending the above Show with Specimens of his ORANGE JELLY TURNIP, and to receive orders for new Seed, which is now being reaped, and will shortly be ready to send out, which will afford an opportunity of substituting it for the last sowing of Globes and other late kinds. To secure the genuine article, direct application is necessary; and as many hundreds were disappointed in a supply last year, G. C. suggests that intending sowers should forward their orders without delay. Arrangements have been made for the quick delivery of all orders per parcel trains, carriage free to most of the principal towns in England, if ordered before the 21st July; and at the Stall 128 in the show-yard, where a full description of the Turnip, with numerous testimonials from some of the most distinguished noblemen and leading agriculturists of the day may be had.—Seed Warehouse, Chester, July 15.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

PAVILION DINNER.—The Tickets for the Pavilion Dinner will be sold at the Finance Department of the Show-yard, Lincoln: (1) To Members only, on Tuesday, July 18, from 12 o'clock at noon till 4 o'clock in the afternoon; and (2) To Members or their friends on the following day, from 8 o'clock in the forenoon till three o'clock in the afternoon. To prevent disappointment, members of the Society intending to dine on the occasion are requested on reaching Lincoln to make the earliest application for Tickets.

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.—The Society's SHOW AT ARMAGH, in the Province of Ulster, will take place on the 9th and 10th of AUGUST next, when Premiums and Cups to the amount of 1200*l.* will be offered to competition for Farm Stock, Implements, &c.
Very favourable arrangements have been made with various Railway and Steam-Boat Companies for the carriage to and from Armagh, of Stock, Implements, &c., duly entered. Thus the Companies of the Ulster, the Ballymena, the Dublin and Drogheda, the Dublin and Belfast Junction, the Dundalk and Enniskillen, have agreed to carry all articles to and from the Show free, so also has the County Down Railway, excepting Horses. The Southern and Western, and the Great Midland Railway, will charge on articles going, but make no charge on articles returning, provided they have not been sold, or have not changed hands.
The City of Dublin Steam-Boat Company will carry to and from Dublin and Belfast, free by their boat, once a week; and the Belfast Steam-Boat Companies will charge articles going to the Show, but carry free those returning unsold.
The Committee have also arranged with the Agents of the Whitehaven, Morecombe, Ardrossan, Carlisle, Greenock, Glasgow, and Stranraer Steamboats to convey Stock, &c., at half freights to and from Belfast.
All entries must be lodged not later than 19th July.
Prize Sheets, and Forms of Entry, to be had on application to ROBERT COCHRAN, Esq., Secretary to the Local Committee, Armagh; or, to me, at the Society's Offices, 42, Upper Sackville Street, Dublin. THOMAS HARENESS, Secretary.

The Agricultural Gazette.

SATURDAY, JULY 15, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, July	19	}	Agricultural Society of England—Meeting at Lincoln.
THURSDAY, —	20		
FRIDAY, —	21		
THURSDAY, —	20		Agricultural Imp. Society of Ireland.

THE agricultural department of the Crystal Palace will now rapidly attain its proper status and development. The material has been already in great measure gathered—implements, soils, rocks, plants, and animals, with their produce, are already only waiting for arrangement; and as the space which they are to occupy is now nearly all at the disposal of Professor WILSON, we may soon expect to see his plans fully carried out. Both floors of the northern wing or gallery are devoted to the museum of the mineral, vegetable, and animal kingdoms which he is organising, and a large space on the ground-floor, under the main body of the building, in immediate connection with the others, is set apart for agricultural machinery. We understand that this has all been taken, a rent is charged which will ensure that a selection only, and those the worthiest specimens, from the catalogues of the different makers will be exhibited; and as all the best names in the trade are already represented on the ground, we may anticipate a more accurate and instructive illustration here of the condition of agricultural mechanics in this country than is furnished even by the unwieldy annual shows of our national societies. The delay of this department of the Sydenham museum has been owing to the non-completion of the part it is to occupy within the Palace—and as the Lincoln meeting has immediately supervened upon the delivery of the space into the hands of those who have charge of the department, it is probable that they will be unable to complete their arrangements until the implement makers are at liberty from their engagements there.

The northern wing is still more recently finished, indeed a portion of it is hardly completed yet, and much remains to be done before the large mass of material for arrangement there can be ready for the inspection of visitors. The corresponding wing at the southern end of the building is occupied by refreshment rooms: there is some rumour of a portion of the northern gallery being also taken for this purpose. We hope that no further curtailment will be allowed of the very limited space already at the disposal of the agricultural department, which requires an even larger scope for its due development than it has at present.

PERHAPS we cannot better assist the solution of one great agricultural problem—that of STEAM-CULTIVATION, of which the postulates and data have been so well defined by "C. W. H."—than by describing in a few words the different designs which have been hitherto propounded. It is well known that a great number of the multitudinous inventions patented every year perish without any use being made of them, simply because it is discovered too late that the same things have been better executed long before. So amazing have been the number of contrivances in some kinds of machinery, that sometimes an inventor can only determine the novelty or redundancy of his idea by attempting its introduction into practical use. Steam-cultivators, however, have received so little attention from mechanical geniuses, that previous notions may be easily investigated; and any inventor, after studying the few examples already in existence, may set his energies to work upon what he may be sure is entirely new. Now, we are not disposed to print "abstracts of specifications," the exact wording of various inventors' "claims," or fill up our columns with woodcuts and diagrams: all we intend is to state the general idea of each machine referred to.

The several attempts at *yoking a steam-engine to common ploughs* may be dismissed with a word; not as being beneath notice, but because a much higher style of operation is generally allowed to be expected from the marvellous aptitude and versatility of steam-power. The first steam plough was set to work in 1836, and since that time several ingenious individuals have constructed machines upon much the same principle—employing an engine to drag sets of ploughs to and fro by coiling ropes or chains round drums and pulleys. The latest is a design, provisionally patented in November, 1852, in which a wire rope is to be wound up, having ploughs, harrows, &c., attached. Probably the most successful is Lord WILLOUGHBY'S, which has been at work in Lincolnshire. As steam has effectually delivered our horses from the round of the threshing-machine, it may be a laudable endeavour to displace them from the plough; still we would rather direct the aim of inventors to some more complete and efficient operation than mere ploughing.

The *spade* being a better tool than a plough as regards the quality of its work, some persons have tried to imitate its movements by mechanism. In the Great Exhibition was seen a large frame on wheels, carrying a number of spades to be worked up and down and oscillated by means of cranks upon a rotating shaft turned by an engine, while the soil thrown off from these spades was to be caught and turned over by a series of scuppets. There was also a model in which a frame of spades or forks was thrust simultaneously into the ground, vibrated so as to loosen the solid earth, and raised and turned half round so as to invert and deliver the loosened spadefuls. Both these machines were reviewed in the Reports of the Exhibition, published in the *Agricultural Gazette* in 1851. In the year 1847, M. BARRAT, of Paris, patented another form of machine for imitating manual digging. It consisted of a locomotive engine working behind it a series of *mattocks*, each somewhat similar in shape to a carpenter's adze, only having a couple of prongs instead of a broad blade. By proper apparatus, in connection with strong springs, these heavy mattocks were struck into the ground; then, by a sliding movement of the bar upon which they hung, they were drawn a short distance backward, to turn over the detached pieces of soil. Meanwhile, the engine maintained a slow uniform rate of progress over the solid land in advance of the tillers. The latest invention for actuating spades by steam power is that of M. BAUER, patented in November, 1853.

And besides these schemes, there have been others for manipulating spades by mechanism put in motion by the mere *traction* of the machine; as, for instance, two inventions provisionally patented in 1853, and another fully patented in September of the same year, in which some broad blades are made to delve, lift, and invert the soil, by means of horse-power applied to draw the implement along.

However, the work of steam culture bids fair to be effected most perfectly, by the order of means recommended by theory—namely, by *tilling or cutting tools arranged upon a rotating spindle.* Nearly a century ago, the Fen drainers constructed a cylindrical cage frame, studded with spades fixed radially, and rolled this along the bottom of their sluggish drains and rivers by means of horses dragging at chains from its axle, the effect being the digging and loosening up of the soft muddy bed, so that the weakest stream could scour and deepen it. A similar contrivance for working upon land excited the risibility of the visitors at one of the earliest agricultural shows, the cylinder having been found to choke up all its immovable spade blades in very few seconds. Perhaps the same fatal suffocation would have arrested the career of the "Archimedian" machine, shown as a model at the Great Exhibition, a roller bristling with knives and prickers, set in a frame to be drawn by horses; provided, indeed, with extra rollers variously shod to suit different kinds of land, these being substituted for each other, like the several barrels of an organ, according to the class of tunes desired. Various mechanics have contrived revolving harrows or grubbers, forkers or diggers, consisting of tines cylindrically curved so as to enter the ground with the greatest attainable ease, and shake off the broken mould behind; one invention, patented in June, 1853, adding a second set of spurs behind the others, and made to revolve by means of wheel work, like that of a drill, to clear the digging teeth of weeds. The best of this class of horse implements is perhaps the forker or digger of Mr. Samuelson; but we are only alluding to these implements worked by traction as containing in their form some hints for our guidance in the very different process of cultivating by a steam-driven shaft armed with cutters. And it is quite possible that we may yet be indebted to the inventors of these *rolling* diggers for the rudimentary shape of tine or claw best adapted to the different motion of a steam rasp.

Further observation must be postponed till next week. *I. A. C.*

The French Government, it appears, is laudably exercising its authority just now to procure an ample supply of good dairy produce for the inhabitants of Paris. Milk, as soon as it comes up to railway stations from the country, or makes its appearance in shops from town dairies, is subjected to chemical analysis, and not a few farmers and dairymen are being fined and imprisoned for adding water, or otherwise adulterating this important necessary of life.

There cannot be a doubt that large towns, English as well as French, are deficiently supplied with milk, and that what they do receive is largely adulterated with water, to say nothing of more deleterious mixtures; so that the example of Paris brings home to the British capital a lesson second to none in her domestic economy.

What most concerns our readers is the question—Can we profitably produce more milk for our large commercial and manufacturing towns, whose rapidly increasing millions are annually becoming worse and worse supplied with it? The experience of all ages proves that good milk, butter, and cream, are highly conducive to health; and it is equally plain that a deficient supply is in some measure the cause of an inferior article; and that the latter, again, has given rise to many erroneous prejudices against milk as a diet.

The increased facilities which railways afford for conveyance, point to the practicability of an increased supply of milk from the country as a profitable concern to all parties. So far as farmers are concerned, we have never heard any one doubt the profitableness of dairy farming on lands immediately adjoining large towns. The fact that farms so situated fetch landlords larger rents, under this system of husbandry than any other, is conclusive evidence on the subject. And the extension of railways has brought many distant farms within the compass of profitable dairy farming. Experience has, in fact, already settled the question, distant provinces now sending dairy produce to the metropolis, which could not do so prior to this mode of conveyance.

But although the work has thus been begun under favourable auspices, its progress has not been such as the rapid growth of our urban population requires; for they obviously ought to consume more milk, though of a better quality, so that the questions arise—has not country milk come up to the standard of richness to procure for it an increased consumption?—is town milk just as good as country milk?—are towns-people indifferent to quality, overlooking the fact that milk to many, if not the vast majority, is the most profitable shape in which they can consume animal food?

As to the first of these questions, we fear, from a little inquiry made, that there is too much butter made in some dairies for them sending very rich milk to town, for samples which we ourselves have examined consisted of, at least, two-thirds skimmed with one-third new; and although equal to inferior town milk, from house-fed cows on distilleries and brewery refuse, it was yet far from doing justice to the country generally, while in some other cases rich milk sent in is no doubt liberally watered. As to the second, it would be absurd to suppose that cows would give as good milk in the polluted atmosphere of towns as in the country, other things being equal; or that the town dairyman, who purchases his food and receives comparatively nothing for manure, can sell cheaper milk than the country dairyman, who grows the former and applies the latter to his soil. At the same time, we have examined several town dairies which produce excellent milk, the health and food of cows being duly attended to; although, we regret to add,—this is not the general rule. The third question must obviously be answered in the affirmative, for there is no denying the fact that in all our large towns indifference is manifested towards the quality of milk, and that the honest dairyman is not fairly supported in the daily scramble for halfpence. In this overgrown metropolis we could point out numerous instances in proof of this, were it necessary.

We, therefore, arrive at the conclusion that until our large commercial and manufacturing towns pay more attention to the quality of milk, they must continue to deny themselves one of the greatest blessings that can be enjoyed at the table of either rich or poor. Rich milk does not contain much more water at times than some of the fish, rabbits, poultry, and butcher-meat so eagerly purchased in our densely populated streets for dinner, while the fatty and caseous elements of the former are far more healthy and nourishing than those of the latter. The French have long been justly celebrated for their attention to and success in cookery, and it is no doubt this view of the subject which has induced the Government of Louis Napoleon to start its chemical investigation of milk in Paris at present; and, as we have already stated, the example brings home to ourselves a practical lesson which we hope will be received in accordance with its merits. The work of reformation, both as to the management of town dairies and an increased supply of good milk from the country, only wants a fair beginning to be productive of the most important and satisfactory results to the community at large—rural as well as urban.

COOKED VERSUS FERMENTED FOOD.

The following able report by Messrs. Andrews, of Comber, will, no doubt, be read with interest. We extract it in an abridged form from the "Journal of the Agricultural Improvement Society of Ireland."

On Feeding Black Cattle and Swine, with Grated and Fermented Food, on the principle proposed by Messrs. Bushe and Barter, as compared with the ordinary mode of Feeding in use at the Establishment of Messrs. Andrews, of Comber.

A Committee appointed to superintend the experiments assembled at Comber on the 29th of January; and, Mr. Barry, the steward of Mr. Bushe, having arrived, the grating implements and vats which Mr. Robinson had supplied for the purpose of the experiment, were set to work. The grating of the roots was very perfectly executed; and when placed in the vats the finely reduced shreds very speedily passed into the state of fermentation, attended by a very high temperature; and on the morning of Friday, the 2d of February, Mr. Barry considered that the food was in a proper state to be given to the animals.

In the presence of the Committee, and with the full approbation of Mr. Barry, four heifers were selected as equal in all respects as possible, from a stock, 26 in number, which had been feeding from the beginning of November. Six pigs of one family, which, from the time of their birth, had occupied the same apartment, and been fed together, were also selected. Each lot was divided by the alternate choice of a single animal in succession, by Mr. Barry, and the steward of Messrs. Andrews, and they were individually weighed on a bridge, and the weights recorded; and at the end of each week during the experiment every animal was weighed.

The records of this experiment strongly indicate the necessity of great care and caution, and of a lengthened course of observation before any conclusive statement shall be hazarded, or decided opinion adopted, in so nice and delicate a subject as the nutrition of animals, the health and constitution of which are so various, that even with the most strict attention to the only available test by weighing them alive from time to time, very puzzling and inexplicable results will frequently be encountered.

In the first week of the experiment, the fermented food seemed to promise even more than the most sanguine had hoped for. The consumption of fermented food was much less than that of cooked, and the increase in live weight of the pigs was considerably more. The animals also appeared full and thriving; and those who at first had doubted were ready to proclaim the undoubted merit of the new process; but, in the second week, the scene was completely changed. Those on the cooked food were making steady progress, while the fermented food had produced scarcely any increase from the former week. It was then observed that in the first week the bowels of those using the fermented food had been confined, and had become free in the second. The apparent success of the former week was, therefore, obviously the result of indigestion and accumulation of undigested matter in the intestines; at the various stages of the experiment irregularity in apparent progress was manifested in both lots, and in a great measure might be accounted for in the same manner.

The conditions of the experiment were prescribed by Mr. Barry himself, and were acceded to by Messrs. Andrews, though materially different from the system they conceived profitable, as a much greater quantity of rich and expensive food was given, than they had been accustomed to use, and much more than at the present market prices was likely to be remunerative. The three pigs selected for the fermented food weighed 3 cwt. 2 qrs. 19 lbs.=411 lbs.; those for the cooked food, 3 cwt. 2 qrs. 8 lbs.=400 lbs.; and Mr. Barry determined that, to each pig 2 lbs. of Beau-meal and 1 lb. of bran should be given daily in addition to as large a quantity of Mangold Wurzel as the animals could consume. The fermented food was prepared by himself, and he carefully attended and fed the animals in his own way. The other lot was fed with steamed roots, mixed with the meal and bran boiled to the state of gruel, according to our usual practice.

Mr. Barry returned home at the end of the second week, but the feeding was continued strictly by the rules he had prescribed; and at the end of the fourth week Mr. Lahy, who had conducted the experiment at Glencairn, as reported, was sent down to superintend the experiment. Finding that Mangold Wurzel was the root used, he desired that Swedish Turnips should be substituted, observing that it was with that root his successful experiment at Glencairn had been conducted; but, at the end of the first week of the Swedes, the result proving much more unsatisfactory, he desired to return to the Mangold Wurzels. That, however, was not thought advisable; and in order to test the relative value of the two bulbs, the Swedes were continued during four weeks; and the result being equally unsatisfactory throughout, the superiority of Mangold Wurzel in comparison with Swedes as food for pigs, seemed to be completely established. To satisfy ourselves on that point, the experiment was continued for four weeks more with Mangold Wurzel, and during that period the increase in the lot feeding on cooked food was double that of the previous period in which Swedes had been used; but those on the fermented food had ceased to make any progress. They were consuming the full quantity of expensive meal and bran, but using a smaller quantity of root than before; and during the period of the last four weeks had actually lost, in live weight, 4 lbs. It was then judged high time, the experiment having been carried on for 12 weeks, to kill the animals; and it was discovered that the intestines of the three that had been fed on fermented food were full of worms, a fact quite sufficient to account for their bad health and retrograde movement.

The intestines of the three pigs fed upon cooked food being, as already stated, of the same family as the others, were entirely free from worms, and two of them were in perfect health to the last. One of them had unfortunately been injured in the process of weighing, and had ceased to thrive. It had, in fact, been making no progress for several weeks, and was killed a week sooner than the others. We shall now proceed to give an abstract of the results of the experiment in figures.

When the animals were killed, the proportion of the dead to the live weight of those fed on cooked food was found to be as 77 to 100; and of those fed upon fermented food as 75 to 100. We have assumed the proportion to be the same at the commencement as at the conclusion of the experiment, though there is every reason to believe that in the lean state the proportion of offal must be relatively greater, and the value of the increase must actually exceed our calculations.

The three pigs fed on cooked food weighed, on the 2d February, 3 cwt. 2 qrs. 8 lbs. = 400 lbs., which at 77-100 would have been 308 lbs. dead weight. When killed, 28th April, they weighed 5 cwt. 2 qrs. and 17 lbs., = 633 lbs. at 77-100. Actual dead weight, 490 lbs.

Increase 182 lbs. at 5*d.* per lb.			£3 15 10
They consumed in 12 weeks—			
33 cwt. of Mangold, at 8*d.* per cwt.		£1	2 0
15¾ „ Swedes, at 6*d.*		0	7 10
4½ „ Beau-meal, at 12*s.*		2	14 0
2½ „ Bran, at 8*s.*		0	18 0
		£5	1 10
Less meal and bran, the portion of one pig killed, 21st		0	1 7
		£5	0 3
Loss by this lot		£1	4 5

The three pigs on fermented food weighed, on the 2d February, 3 cwt. 2 qrs. 19 lbs. = 411 lbs., which, at

77-100, would give 316 lbs. When killed, 28th April, they weighed 4 cwt. 3 qrs. 5 lbs. = 537 lbs., which, at 75-100, gave actual dead weight 401 lbs.

Increase, 85 lbs., at 5*d.* per lb....			...£1 15 5
They consumed in 12 weeks—			
17 cwt. Mangolds, at 8*d.* per cwt.	...£0 11 4		
7¼ „ Swedes, at 6*d.*	... 0 3 9		
4½ „ Bean-meal, at 12*s.* ...	... 2 14 0		
2½ „ Bran, at 8*s.*...	... 0 18 0		
		4 7 1	
Loss by this lot		£2 11 8	

The result of the experiment, even with the lot fed on cooked food, being very discouraging, as respects the question of profit and loss, it seems desirable to examine its bearings more minutely.

As has been already stated, one of the pigs fed on the cooked food was injured and had ceased to thrive, and was killed before the others. It had in the 11 weeks only gained 22 lbs. of dead weight, while the other two had gained 160 lbs., a great part of the loss on the lot thus arising from that cause.

Excluding that pig from the calculation, the other two weighed (2d February) 2 cwt. 1 qr. 33 lbs = 285 lbs., at 77-100 = 219 lbs. When killed (28th April) they weighed 4 cwt. 1 qr. 17 lbs. = 493 lbs. ; dead weight, 379 lbs.

160 lbs. at 5*d.* per lb.	... £3 6 8	
Cost of food for the two, two-thirds of 5*l.* 1*s.* 10*d.*	3 7 11	
Loss only	... £0 1 3	

But, as has already been observed, the progress during the middle period of four weeks (when feeding on Swedes) was much less than when on Mangolds, it seems proper therefore to view the results, excluding the Turnip period.

The increase of the two pigs during the two periods of four weeks each, when feeding on Mangolds was—

1 cwt. 2 qrs. 5 lbs. = 173 live weight, 133 dead, at 5*d.*	£2 15 5	
The Mangolds, Bean-meal, and bran consumed by those at the prices above stated, during the eight weeks, cost	2 6 8	
Gain under that view ...	... £0 8 9	

Considering that the present prices of the Bean-meal and bran, used so largely in the experiment, are so extremely high and disproportioned even to the present high price of pork, let us look at the amount as it would stand at average prices—

Rating the increase of 134 lbs. at 4*d.* per lb., amount	£2 4 4	
The food consumed in eight weeks—		
22 cwt Mangolds, at 6*d.* per cwt. ...	... £0 11 0	
2 cwt. Bean-meal, at 8*s.* „	... 0 16 0	
1 cwt. bran, at 5*s.* „	... 0 5 0	
	1 12 0	
Would exhibit a gain of	£0 12 4	

And even that view is subject to the reasonable assumption that the proportion of Bean-meal and bran is greater than a due regard to profit would justify ; it is certainly greater than we have been accustomed to use. If 1 lb. of Bean-meal were given on the average during the period of feeding, from the time the animal attains the weight of 80 or 90 lbs till it shall reach 200 lbs. ; and if that were increased to 1½ lb. during the remainder of the feeding, with a supply of steamed or boiled Mangolds, a greater amount of profit than has been contemplated in any of the above calculations might reasonably be expected.

We have taken no account of fuel in any of the above calculations. The saving of fuel by fermenting the food is certainly something, but it was vastly overrated in the estimate at first submitted to the society. With a steam boiler, or even an ordinary boiler well set, the consumption of fuel is really very inconsiderable; and the cost of increased labour, in the careful washing and grating of the roots, is not of small amount. It is proper to mention, however, that the use of the grating machine, preparatory to boiling, very much expedites the process, and, of course, proportionately economises fuel. It only remains to say a few words respecting the experiment with black cattle. It has been our long-established practice to give our fattening stock raw sliced Swedes, unwashed, in quantities of 70 to 80 lbs. daily, in three feeds, mixed with about 10 lbs. Wheat chaff, or cut straw, enriched with 4 to 5 or 6 lbs. of Bean, Barley, and Linseed-meal, mixed in such proportions as the relative prices of the several articles and our convenience may render desirable, and boiled by steam with distiller's wash during winter, into a thin gruel, and thrown in a boiling state upon the chaff. The enriched chaff is equally distributed among the three feeds of Turnips. Under this system of feeding, we have attained a high character for well finished cattle. During eight weeks the Swedes were washed, grated, and fermented, though in a less degree than for the pigs, and given to two of the heifers, in exactly the same quantity, and with the same addition of enriched chaff that was given to the other two, in an unprepared state. They seemed to like the prepared roots ; and the mess, when mixed, appeared to be in an excellent state ; but, during the eight weeks, there seemed no difference in the result. These on the prepared food gained less of live weight by 14 lbs. than the others, making only 4 lbs. dead weight, in eight weeks, on each which might have been accidental. What has now been submitted would seem to indicate the propriety of further careful experiments with cooked food, in various proportions, in order to ascertain more definitely the most productive and remunerative combinations.

LIQUID MANURE AND IRRIGATION.

I AGREE with Mr. Mechi in thinking that a veil yet covers the manure question, and I scarcely need say to the readers of the *Gazette* that, if I do not go the whole way, I go very far with him in opinion as to the value of its effects on the inorganics. It seems scarcely to admit of question that the action of the organic parts of our manures on the soil must be exactly similar to that of the atmospheric air ; and we know that there was a time when the action of this air, together with the alternation of heat and cold, with water—and water again is composed of what we term organic (I think not very correctly, I would rather say gaseous) elements—were found sufficient to break down rocks, and make fertile soils before men existed to supply them with manures. A very principal effect, then, of our manures must be to operate on the crude *materiel* in the soil, first reducing it, and then rendering it soluble, and so accessible to plants ; a solution implies water in sufficient quantity to dissolve, and as the roots of plants drink and do not eat, it appears very simple that an abundant supply of water is necessary to give an abundant supply of food to plants. And as plants are in part composed of inorganic or earthy matters, it appears equally simple that they are essential to them.

The quantity of water constantly evaporating from all the parts of plants above ground creates a very large demand at their roots. An artificial supply of water, when the soil is too dry to furnish their normal demands, must be necessary to their health ; and as water forms the carriage of all matters received into plants through their roots, the larger and more constant the supply (not more, it is to be understood, than they can evaporate) afforded them, the more rapid must be their growth ; they should always be fully fed ; a deficiency of water at any time in the soil must deprive the plants of food in proportion to that deficiency. And here are the advantages of deep draining and deep working ; the roots get into a soil which, being less operated on by evaporating causes, retain to their use a more regular supply of water. But I think it not improbable that plants in a dry soil may suffer further injury by being compelled to give up their moisture to the soil. The supplying of plants with manure in a liquid state, when the soil is not saturated with water, is evidently conducive to their well being—care being taken to dilute the manure in proportion to the dryness of the soil.

But it seems questionable that we are to attribute the immediate effects on plants observable on the application of liquefied manures to their action on the organics of the soil ; they must act more directly on them, they must enter the plants in some way before time is allowed for operating on the soil.

Its evaporation from the soil may be one of the causes of the superiority of liquefied over solid manure, as Mr. Mechi supposes, but he is probably in error in supposing a return of the same exhalations at night. For this evaporation from the soil, not only of ammoniacal vapour, but even of inorganic matter, I contended in the *Agri. Gazettes* of 1844, and subsequently, as affording food to plants, and promoted by our hoeing operations : I looked upon it as the explanation of their uses. Indeed, to leaf drinking in and to leaf inspiration I attached the greatest importance in the feeding of plants, and I have had no reason to change my opinion. I can attribute to nothing else the evident benefits to vegetation that attend on our very superficial operations, and I am much pleased that Mr. Mechi should have brought his liquid manure system to bear upon it. However roots may run out laterally, their smaller fibres descend too deeply into the earth to benefit by any recent applications of manure, either dry or liquefied, except in the first and earliest stages of their growth.

Liquid manuring, then, however it may be accomplished—by the rich man with his steam-engine, or by the poor man with his cart, or his barrel and trough—is most undeniably a very beneficial application of manure ; one that will well recompense the cost, and would, if general, rescue the country from all chance of famine, and secure to us cheap food with greater certainty than even free trade can do. At the same time, I would not exclude dry manuring ; the carbon of straw and peat mould, with some other matters, may so be profitably applied, and left to dissolve in the soil by natural supplies of water, in those seasons of the year when it is in excess; and though some may repudiate carbon from their fertilising ingredients, I think Mr. Mechi will scarcely be of the number, for if "water is three-fourths of our precious selves, and often more than three-quarters of our food," in still greater proportion does carbon enter into the more solid parts of our food ; so, then, it ought into our manures, and the more so if the composition of plants is to afford a rule for feeding them.

With all due diffidence I would say, Mr. Mechi mistakes in supposing that by Mr. Way's experiments all the ammonia is fixed, for no doubt clay must have its point of saturation ; indeed this is admitted by the observation on the coloured and scented discharge from the drains. Both on this account and on the faith of the value of leaf feeding, it were to be recommended to keep our solid manurings as near the surface as possible, and to use liquid manure in small quantities, with frequent applications. *J. M. Goodiff, Granard.*

THEORY OF AGRICULTURE.

UNDER this heading we propose giving the rationale of the art, so far simply as that economy of food for plants is concerned which is supposed to be insured by rotation of cropping. Experience has established the practical utility of a proper rotation of crops, and has shown that there are few soils on which one and the same crop can be grown for a succession of years with advantage to the occupier of the land ; and that even where, for instance, it is possible to grow corn year after year, an alternate system of cropping is still advisable, in order to maintain or to improve the fertility of the land.

It is the province of science to account for the causes of the beneficial results attending a proper system of alternate husbandry.

Whilst we acknowledge the most successful rotations to be the result of practical skill and experience, we admit, at the same time, the insufficiency of the theories hitherto suggested for accounting fully and intelligibly for the principles on which the rotation of crops rests. It is for this reason that we shall give but a brief exposition of those theories which have enjoyed the greatest popularity. There are especially two which require to be noticed. The one, suggested by Decandolle, and known as the excretion theory, has preceded the other, which, under the name of the mineral chemical theory, has entirely eclipsed the former, at one time held in almost universal esteem.

It was supposed by Decandolle and his followers, that the roots of all plants excrete certain substances, analogous to the excrements of animals, and that these substances exercise an injurious effect on those plants from the roots of which they have been excreted; but that they are harmless to other species, or even promote their luxuriant growth. When a field, after a succession of years, refused to grow any longer a remunerative crop of Wheat, but repaid well the cost of raising a green crop, this experience was explained by the excretion theory in an apparently simple and intelligible manner. The excretions of the roots of the Wheat plants of former crops, said the adherents of Decandolle's theory, have accumulated in the soil to such a degree that it has become poisonous to plants of its own kind ; but these poisonous excretions of the roots of Wheat are food for a green crop; and thus Turnips, for instance, succeed well after Wheat. The experience that Wheat could be cultivated again after a bare fallow, was explained in an equally simple manner. During the time of rest, it was said, the poisonous excretions of former crops have time to decompose, and to become converted into food for another crop of Wheat. Beautiful and intelligible as this theory may at first sight appear, it is marked by the great fault of not resting upon facts and observations ; and as this is now generally admitted by all natural philosophers of any authority, we shall not stop to expose the errors on which it is based, but shall at once briefly direct attention to the chemical mineral theory, which, at the present time, is believed to explain more fully and consistently the beneficial effects of a rotation of crops.

The analyses of all our cultivated plants have shown that they, without exception, contain a certain amount of mineral substances, which remain behind, generally in the form of white ash, when the plants are burned in an open vessel. These mineral substances, it is evident, must exist in the soil, or in the manure applied to it, before they can find their way into the organism of the plant ; and as they are invariably found in all plants, and as the most decisive and careful experiments have distinctly proved that the absence of one or more of those mineral matters which enter into the composition of plants is a sufficient cause to stint a plant in its growth, and to prevent its coming into perfection, it will for ever remain a scientific truth, and not a mere theory, that these inorganic substances, constituting the ashes of plants, are not mere accidental matters, but as important and essentially necessary to bring all plants to maturity as any atmospheric or organic food which they may require. What, therefore, can be more natural than that the soil, when sown with Wheat or Barley, will not produce, year after year, a remunerative crop of grain ? Knowing as we do now, that the seeds of our cereals contain much phosphoric acid, it is clear that by the continual removal of grain crops from the land, it must become so impoverished in phosphoric acid that it will no longer contain a sufficient quantity of this substance, so necessary to the perfection of the seed of our white crops.

Or, if it were practically possible to cultivate, year after year, Peas, Beans, or any other leguminous plant, we should soon find that these crops, which all abstract a considerable proportion of lime, will fail on land naturally deficient in this substance. Hence the necessity of alternating crops removing from the soil one substance with such crops as require a different kind of mineral matters, or, at all events, these mineral matters in different proportions. The analyses of the ashes of our cultivated plants have indeed shown that the various mineral matters which we find in all are removed from the soil by different plants in very different relative proportions. Whilst some kinds, as, for instance, the leguminous plants, abstract principally lime in great abundance, other kinds, as our cereals, abstract largely phosphoric acid and silica ; and again, others, as, for instance, Turnips, Carrots, Clover, &c., attack in an especial manner the stores of potash in the soil. According to the preponderance of one or the other mineral substance in the ashes of plants, Liebig, it is well known, divides all plants into four groups, namely into—

1. Plants requiring an abundance of phosphoric acid.
2. Plants requiring an abundance of lime.
3. Plants requiring an abundance of potash or soda.
4. Plants requiring much silica.

The requirements as to the various mineral matters thus being very different in different species or families of plants, the advantage of growing a crop which removes from the soil much of one particular mineral matter, after another not so dependent for its healthy growth

on an excess of that particular mineral substance, will at once become apparent. In short, the beneficial effects which result from a proper rotation of crops are explained by the chemical mineral theory, on the supposition that each of the alternating crops removes from the soil some particular kind of mineral matter, in preference to others, so that a succession of different crops will be supplied with mineral food from a soil which would not have been in a condition to meet the wants of a succession of the same crop, without the addition of renewed quantities of mineral manuring matters. It follows as a necessary consequence, from the acceptance of this theory, that the same course of cropping can be successfully maintained only if all the mineral matters, which are removed from the land by the successive crops, are at the end of the rotation again added to the land in the shape of manure. The recommendation to return to the land all the mineral substances which have been removed from it by the various crops of a rotation, certainly deserves the consideration of the practical man; and this he may do without troubling himself much with minute calculations, and without keeping a debtor and creditor account of all the mineral matters which have been removed by the different crops, and of those returned to the land in the manure. We have, indeed, no hesitation in saying that such a system of account-keeping, which some men have recommended who have evidently over-estimated the practical bearing of the mineral theory, would only entail upon the farmer a world of trouble, without securing to him any practical benefit. The fact is, the ash analyses of plants have not been attended with that amount of practical benefit to which they at first appeared to lead.

Upon the chemical principles stated above, the benefits resulting from alternating crops might appear to be successfully explained, but, in reality, all explanations on this point, which are wholly based on these principles, have but an imperfect foundation, for it is not difficult to prove that the gradual removal of mineral substances from the soil by a succession of different crops, does not account for the advantages resulting from a system of alternate cropping. Without entering into many details, we would observe that the fact that a crop of Clover not only leaves the fertility of the land unimpaired, but actually increases its productive powers, so that Wheat succeeds remarkably well after it, plainly contradicts the purely mineral chemical theory. For it is worthy of observation, that of all crops which are usually cultivated, none removes so large a quantity of mineral substances as Clover; thus, assuming the mineral theory to be correct, Clover must indeed be considered as one of the most exhausting crops. Practical experience, however, teaches the contrary. The exhaustion in mineral substances by a crop of Clover, not only affects one or the other mineral constituents found in the ashes of plants, but all the mineral matters entering into the composition of Wheat. A crop of Clover thus removes a larger quantity of phosphoric acid, potash, lime, and, with the exception of silica, of all other mineral matters than is required by a crop of Wheat, and yet Wheat succeeds remarkably well after Clover. The exhausting effects of our cereals cannot therefore be attributed to the abstraction of a larger amount of mineral matters from the soil. In endeavouring to explain why our white crops exhaust the land in a greater degree than Peas or Clover, though the last mentioned crops abstract a larger quantity of those mineral substances which the former also require, we are led to inquire whether the organic constituents of the soil or the atmosphere do not play a far more important function in relation to plants, and consequently affect the theory of rotation of crops, much more than has been hitherto conceded by the adherents of the mineral theory. It appears to us, indeed, that the exhaustion of the soil by our cereals is not so much due to the abstraction of mineral matters from the soil as to the dissipation of humus, or more correctly speaking, the nitrogen of the organic portion of the soil. This dissipation or loss in nitrogen, which has been repeatedly observed by Mr. Lawes, probably finds an explanation in the unsheltered state in which the land is left by crops like our cereals; for it is evident that the bare stalks of Wheat or Barley cannot protect the soil from the atmosphere, which preys upon its organic constituents and dissipates them, so well as crops like Clover and Peas, which by their spreading leaves afford a good cover, and thus counteract this influence. Or we must have recourse to assume what indeed appears to be very likely, that, whilst Wheat, Barley, and in a smaller degree Oats, are principally dependent for their supply of nitrogen on the nitrogenised constituents of the soil, Clover, Lucerne, and other crops which are characterised by an abundant foliage, can draw their supply of nitrogen from the atmosphere in one form or the other. The fact, so clearly proved by Mr. Lawes, that the cereals are benefited in an especial manner by ammoniacal salts, compounds rich in nitrogen, whilst the condition of Beans is not improved by the same fertilisers, strongly supports this view, and, at the same time, affords a ready explanation why Wheat succeeds so well after Clover. If we bear in mind that the deep roots of the Clover plant are not removed from the land, it will appear that the humus in the soil, and with it the nitrogenised matters, must become very materially increased; and it is, no doubt, on account of this increase in organic food, that Wheat grows so luxuriantly after Clover. According to the experience of E. John, the roots of a crop of Clover, having furnished 1960 lbs. of dry Clover hay per acre, which remain in the surface and the uppermost layer of the subsoil, amount to 1500 lbs., and in this quantity of roots 34 lbs. of nitrogen are present. The gradual decay of these remains must thus furnish a considerable quantity of ammonia, or nitric acid compounds, which are well-known promoters of the luxuriant growth of Wheat.

It will appear from the remarks which have been made on the mineral theory, that it does not afford in all instances, nor, indeed, in the majority of cases, the means of explaining the benefits of a good rotation of crops. In conclusion, we would observe, that in giving a satisfactory explanation in this respect, a great variety of circumstances, as, for instance, the natural habits of the plants, the physical condition of the soil, the climate, &c., must be taken into consideration. The neglect of a due regard to these and other particulars, into the discussion of which our limits do not permit us to enter, must necessarily lead to one-sided views and deductions, which are at variance with decisive facts and precise observations. [*A. V.*]

[We add to these remarks by Dr. Voelcker, in the forthcoming number of *Blackie's Cyclopedia of Agriculture*, the practical inference, that whatever the cause of the increasing poverty of land under repeated crops of corn, it may be enriched by the artificial application of manure, and even by such cultivation as shall enable the full use of natural sources of fertility, so as entirely to counteract the exhausting influence of any method of cropping that it may be deemed advisable to adopt. So that while adherence to a well-defined rotation of crop may practically be a security for the permanent value of the land, that can be insured by the intelligent cultivator under any method of cropping which markets may suggest for his adoption.]

Home Correspondence.

Malt v. Sugar.—The present high price of malt, combined with the low value of sugar, 3½*d.* the pound, offers an inducement to make use of the latter in preference; and I have the authority of an experienced brewer to say that 21 lbs. of sugar is fully equivalent to a bushel of malt, and that the combination of malt and sugar on such a scale produces better beer than malt alone—the saving, is about 50 per cent. in favour of sugar. The gentleman alluded to has given me the accompanying recipes. I intend to make use of them myself, and shall feel obliged if you will publish them. *W. B.*

Economical Beer.—For every bushel of malt now used substitute 21 lbs. of brown sugar. The process will be much simplified, as no mashing will be needed, and the whole operation will not occupy more than 3 or 4 hours. Suppose 4 bushels of malt to be the quantity now brewed. Take instead 84 lbs. of strong brown sugar. First boil 5 lbs of Hops in 38 gallons of water for an hour and a half; draw off; reboil the same Hops in 38 gallons more water for about an hour, draw off, and mix with the first boiling, after which add the sugar and stir it well, till it is all dissolved; when it is sufficiently cool, say 72° Fahr., put in 3 pints of good yeast, which must be well stirred and allowed to ferment as usual, and afterwards put into casks. The beer thus made will amount to about 72 gallons, or 2 barrels, and be fully equal in strength and quality to London porter. It will keep equally well, and be more palatable. If a greater strength be required diminish the quantity of water; but if weaker, then increase it in proportion. If a mixture of malt and sugar is preferred, take the malt, and make it into a hogshead of wort, and when it is sufficiently cool to add the yeast for fermentation, put into the wort the quantity of sugar you intend to substitute for malt, and mix it with the yeast in the working tub, and ferment it all together; if half sugar and half malt, to brew beer equal in strength to London porter, will require 2 bushels of malt and 42 lbs. of sugar. If three-fourths of malt are preferred, 3 bushels malt and 21 lbs. sugar.

To make Colouring from Sugar.—Half fill a large iron pot with good dry sugar; put fire under, and keep the sugar well stirred till it becomes black, and in the state of a thick fluid; add water to reduce it to a usable consistency, continuing to stir it until the fire is withdrawn. It may be then put into a barrel and used as required.

New Food for Sheep.—Whilst I was at Geneva I observed every one collecting carefully the fruit of the Horse-chestnut, and on inquiry I learnt that the butchers and holders of grazing-stock bought it readily at a certain price per bushel. I inquired of my butcher, and he told me it was given to those sheep in particular that were fattening. The Horse-chestnuts were well crushed; something in the way, so I understood, that Apples are, previous to cider being made. They are crushed or cut up in a machine kept solely in Switzerland for that purpose; then about two pounds' weight is given to each sheep morning and evening. It must be portioned out to the sheep, as too much would disagree with them, being of a very heating nature. The butcher told me that it gave an excellent rich flavour to the meat. The Geneva mutton is noted for being as highly flavoured as any in England or Wales. *E. D.*

The Wheat Crop in France.—June 24: I have to-day had a seven miles walk over the Wheat fields in the neighbourhood of La Bice, about 30 miles S.E. of Paris; the Wheat is in full bloom, and a more magnificent crop never grew out of the earth; not a weed is to be seen in it, and a great deal of it is so tall that I can (although 6 feet in my shoes) barely see over it. This part of the country is in the hands of small proprietors, but not so much divided as in some places; my friend the farmer, to whom I have paid this visit, owns 20 acres; he lives in comfort and saves money every year, but then the land is excellent, and I found could not be bought under 100*l.* or 120*l.* per acre. They have a system of half fallowing here which I have not noticed before; the land is ploughed in February, and manured; Potatoes are planted in March, in rows, 3 feet row from row, and 3 feet apart in the rows; the large space of bare ground is kept clear with the hoe all the summer, and a crop, more than sufficient to pay expenses, is the result; this they say is a most excellent preparation for Wheat, as the land is not too much loosened, and Wheat likes firm land. I certainly never saw finer Wheat, even in our rich fen lands of Cambridgeshire. —June 29: Angers, the Wheat, all the way from Paris to Nantes, about 300 miles through the plain of La Beauce, is as fine as our finest crops in England. I have visited France for 25 years, and never before saw it so invariably fine; here it has rained incessantly for two days, and great fears are entertained respecting the Wheat, which now requires dry and fine weather. I walked in the fields this morning with a friend, and to to his great alarm we perceived the blight, called in England red gum, spreading rapidly; some of the fields in which the red Wheat was changing colour and ripening fast were much infested, and a third of the crop destroyed; the farmers were much alarmed. This blight is called here "Cryptogame rouge," and, as may be seen in a powerful microscope, is a beautiful fungus. *R.*

Notices of Books.

Agricultural Meteorology: the Great Snowstorm of January 2, 3, 4, 1854. "To the Editor of the Agricultural Gazette." (*For gratuitous distribution only*).

MR. MARTIN, whose papers on this subject in past numbers of this Journal have been read by many of our readers, was kind enough to send us some weeks ago a long paper on the snowstorm of January, in which our correspondent "R's" challenge (at p. 141) to explain it upon the rotatory theory was accepted, and an immense mass of observations at a number of stations along the track of the storm, and on either side of it, were collated in order to show how with reference to time, the storm progressed along a given track, how with reference to any one moment, observations at a variety of places showed it to be a whirlwind on a great scale,—and how, with reference to any one station, the wind veered, as on the supposition of such a whirlwind passing to the right or to the left of it, it would; and the barometer fell and rose, as on the supposition of the passage of such a whirlwind, we presume that it might be expected to do. This paper we really had not room for in our columns, and so Mr. Martin has published it in the pamphlet form, in which we have just received it. The pamphlet concludes with the following postscript:

"In explanation to some of my correspondents who may feel that the fair proportions of their respective communications have been unduly curtailed, it is proper that I should state that the Tables and Diagrams were arranged under the impression that this essay would be admitted into the *Agricultural Gazette* in the same manner as was the review and challenge to which this was intended as a reply. Under this expectation I diminished the size of the Diagrams and condensed the detail of the Tables, to the omission of two very important particulars, viz., the barometer, and the state of the weather. I regret this however the less, because any of my readers may ascertain from his own recollections how far the track I have assigned to this storm, as deduced from the fluctuations of the barometer and the changes of the wind, coincides with the facts that came under his own observation."

We have only to add to this that we would gladly have given admission to our pages to so much of the paper and of the conclusions to which it arrives as their size and number would have permitted us, consistently with the more immediate importance of the strictly agricultural subjects to which they should be devoted. It has been with no desire to shelter Mr. Martin's meteorological opponent, our correspondent "R," that we have failed to publish this paper *in extenso*. We are sure that "R.," as much as any one, desires fair play for his opponents; and had the article been of more immediate agricultural importance, we would gladly have published it, notwithstanding its length. Under the circumstances, however, we can do no more than refer, very shortly, to the evidence it adduces on the three points already alluded to.

1. As to the passage of the storm in the order of time, the following table gives at a number of stations from south to north, with the period and amount of the greatest depression of the barometer during the occurrence of the storm at each station; and it will be seen that it indicates a gradual passage northwards of the central point of the storm.

SYNOPSIS OF BAROMETRICAL FLUCTUATION.

2. That this period of greatest depression corresponds to the central point as we have called it, is apparent from the following table, which shows, with some uniformity, that the wind at a number of stations veered,

as on the rotatory theory of storms it would, and which also shows in many of the instances that the period of greatest barometrical depression corresponds with that of the abrupt change in the wind consequent on the passage of the storm's centre.

3. Lastly, take any given date, and lay down upon the

map of England, from the above tables, arrows indicating the direction of the wind at those stations at that date, and it will be found with what degree of uniformity and accuracy they correspond to a motion of rotation around a continually advancing centre.

Other tables are given in the pamphlet, for which we have not room. We doubt not any one especially interested in the subject will find little difficulty in procuring the perusal of a copy.

Miscellaneous.

The interval between Sowing and Reaping.—I forward to you a copy of a register I have kept for 14 years of the first sight of Wheat ears, and the cutting of the same crop—11 on my own farm, three on an adjoining one (marked*). Crops generally in this district are a good colour, though rather thin on the land. Late sown Barley a failure in many instances. Grass exceeding short. Potatoes promising. Fallows unusually clean. South country agriculturists who attend the Lincoln Meeting, going by the loop line from Peterborough, will see a district not easily surpassed for fertility and profitable farming.

Calendar of Operations.

JULY.

RHINS OF GALLOWAY, *July* 6.—The weather for some time past has been extremely wet and cold for the season; notwithstanding which we never saw the crops generally looking so bulky and luxuriant, and, with fine weather from this time forward, there is every prospect of abundant crops. Some fears are, however, entertained as to the injurious effect of the present wet weather on the Wheat crop, which is now mostly in ear, and some of it in flower. Oats promise an abundant return, with greater bulk of straw than we have had for years. Turnips have grown very slowly, and little progress has yet been made in singling. Mangold Wurzel, which has been sown to a considerable extent, in many cases has come up very thin; the same in regard to Carrots, which in some instances have been ploughed up to sow Turnips. Grass on all dry soils has been abundant, though stock generally have not improved rapidly during the last month, the weather being so cold and the pastures always wet. Barn-yards are well cleared out, little remaining except a stack or two here and there for thatching the coming crop. Little grain now remains for sale in the hands of the farmer, the price being such during the season as to induce the keeping of light stocks. Unless we have very fine weather, the harvest will be considerably later than last year.

WESTER ROSS, *July* 3—We have got Turnip sowing completed, but not until we are at a loss what next to turn our hands to. Potatoes have been once hoed, but they generally receive a second hoeing, and are now requiring it, and then they are furrowed up. Turnips have been making very rapid progress for the last fortnight, and singling of Swedes is now pretty general. The weather has been very genial, and there has been abundance of rain for the most rain-loving plant. To-day all out-door labour has been suspended, the rain pouring heavily and continuously. Potatoes are generally looking well, and are well advanced. There are complaints, however, in many places, of want of braird, and the likelihood is that the crop will not be so large as last year. The hay crop is not heavy; pasture for sheep and cattle is abundant. The weather has been very unsuitable for Wheat in its present precarious stage, and there is much alarm lest rust prevail to an unusual extent. For many days together the sun has scarcely made its appearance. There will be abundance of straw over the whole north of Scotland; in Morayshire the crop will be very heavy, especially Oats and Barley. In spring there were a few weeks of dry weather, which thinned the Wheat, yet it is now strong and pretty close, and if free from rust might be a large yielding crop. One field in the neighbourhood of Elgin forms nearly the only exception to this general statement. It is now growing what was intended to be a third crop of Wheat in yearly succession. Last year there was a pretty good second year's crop of Wheat upon it, the previous crop not having exhausted the whole of a large application of manure. Deceived by this, the occupier had it intimated through the *Mark Lane Express* that he had found out the way of making Wheat grow continuously, for any number of years upon the same ground. The field has a beautifully variegated appearance, the weeds having flowered to admiration, the Wheat itself reminding one of the Irishman's crop, "One stalk here, and none there." We hope that as wide-spread intimation will be given of this year's failure, as there was of last year's success. Last Muir of Ord market was good beyond precedent. Pasture being abundant, the show of cattle and sheep small, and purchasers numerous, the competition was something like that of a brisk roup.

Notices to Correspondents.

AGRICULTURAL EDUCATION: *A.* The conference before the Society of Arts, and the results to which it may lead, we must endeavour to refer to next week, or the following. Attention ought to be called, too, throughout the country, to the educational exhibitions, under the auspices of the Society of Arts, which is now open in St. Martin's Hall, and which schoolmasters and others interested in education ought to study.
